Haunting Well-Being: Conflicting Western and Indigenous Matsigenka Conceptions of Food, Nutrition, and Health

Western notions of well-being are used as global standards for healthy bodies, haunting and influencing the livelihoods and self-determination of minorities and Indigenous populations. This is exemplified by how malnutrition is defined by the World Health Organization, which is used by governmental health institutions to develop strategies to mitigate it. The body normality established by WHO standards corresponds to urban sample populations, often of high socioeconomic status. Despite the WHO's noble intent to identify and combat global child malnutrition, its standards misrepresent the diversity of bodies that populate the world. Furthermore, local conceptions of nourishment, health, and well-being, which are part of broader ontologies of how the world functions, are ignored. This can lead to misguided attempts to solve an externally perceived health problem without understanding what is at stake. Here, I address this challenge by exploring notions of food, health, and well-being in an Indigenous Matsigenka population in Amazonian Peru and comparing them against WHO health standards. Based on 37 months of ethnographic research, I propose that health for the Matsigenka is part of a broader condition of well-being influenced by relationships with both humans and non-humans that compose the Matsigenka world. These results will facilitate collaboration with the Matsigenka people in the development of culturally appropriate strategies to improve well-being as they conceive it.

7513 “Genealogy of the broken: Indigenous multispecies research for land and people”

Start Date: 11/20/2025 4:15 PM **through** 11/20/2025 5:45 PM

Venue: Sheraton **Room:** Napoleon BR A3 (3rd fl)

Type: Oral Presentation Session

In Joy Harjo's poem, "Speaking Tree," she writes, "Some things are unspeakable:/Genealogy of the broken-/A shy wind threading leaves after a massacre/Or the smell of coffee and no one there..." A powerful observation of unspeakable loss of human life in Indigenous worlds is interwoven with the

suffering and destruction of nature. And then she asks, "What shall I do with all this heartache?" This panel offers Indigenous multispecies research, including ethnography and mixed methods, as one kind of response to Harjo's reflexive question. Through in-depth descriptions of research methodologies, axiologies, or applications of research, presenters from different cultural and linguistic contexts explore ways that Indigenous peoples who are connected to human and more than human communities are crafting research with people and places. Through dynamic presentations, we acknowledge holistic views of Indigenous research anchored in interdependence with nature and in service of the liveliness that characterizes our Indigenous community contexts.

Inspired by widespread calls for recognition of earth and human brokenness that we increasingly confront and possibilities of (re)connection toward land and human healing, we present research that critically analyzes colonial and modern constructions of global development and their impacts on human and natural relationships. In this moment of rampant global development that characterizes the Anthropocene, we emphasize the roles of Indigenous and endogenous researchers who draw from epistemologies of place and Indigenous research methodologies through two interconnected lenses: First, we consider human relationships to and alternately, separation from land and nature through environmental threats that include climate change, extractive industry, and mass consumption, and what these imply for research. Second, we describe ideas of place and peoplehood through a discussion of endogenous and Indigenous knowledges and their significance for research design and impact. We engage dialogue among researchers whose work includes American Indian traditional arts, new media studies, Indigenous environmental studies, education, and animal sciences. Using comparative and synergistic insights, we engage the link between pluriversality (Escobar, 2018) and earth beings (de la Cadena, 2015) and the more than human (Abram, 1996). We argue that endogenous and Indigenous research requires researchers to expand our scope through iterative approaches to Indigenous holistic ecologies. Across five presentations, we contribute to Indigenous and endogenous intergenerational knowledges as we unpack how researchers work towards ecological healing and environmental regeneration across spaces, including academia, schools, and industry, and how multispecies research has the power to help people understand and rethink our fractured relationships with each other and our planet.

Presentation(s): Questions of environment and inheritance: Pueblo traditional arts, neoliberal narratives of place, and Native American education

Lomawaima and McCarty (2006) named settler colonial strategies of "erase and replace" as pervasive and cyclical approaches to national identity formation related to human separation from

experiences in and with Indigenous places and cultural practices. As progenitors of modern society, dominant schooling assists in diminishing these relationships and the practices that have allowed human beings to thrive for countless generations, contributing to the reproduction of placelessness. However, Indigenous peoples like the Tewa of northern New Mexico are aware that human beings worldwide have been engaged in deep and intimate relationships with places, and that their epistemologies and ontologies are places. While Western capitalistic society devalues and separates people from relationships with place through global economic activity and neocolonialism, a mandate for conscientious Indigenous researchers and Indigenous-serving educational institutions interested in place is to provide counternarratives and ways of reversing the deplacing/displacement of people through research and education. Using examples of community-based education partnerships, I discuss traditional arts as place-based practices and innovative expressions that include ceramics, basketry, architecture, and textiles. My aim is to provoke conversation regarding what it means to re-engage with the practices that have allowed Indigenous people to thrive for millennia through place-based research and learning.

Presenter(s): Porter Swentzell

Settler Anxieties: Critical Indigenous Interventions in Fame, Technology, and New Media Studies

In 1944, Ella Cara Deloria wrote, "...the ultimate aim of Dakota life, stripped of accessories, was quite simple: one must obey kinship rules; one must be a good relative...Without that aim and the constant struggle to attain it, the people would no longer be Dakotas in truth. They would no longer even be human." Inspired by Deloria's fieldnotes, other archival research, and kinship with Lakota Elders, the purpose of this paper is to interrogate, establish, and articulate the explicit and implicit ways fame, status, technology, and new media operate as ideological apparatuses of the settler colonial state. I situate these structures as settler ways of knowing, being, and relating to the world—ways of knowing characterized by liberal and modernist logics. I argue that the logics of liberalism and capitalism are encoded within the technologies of new media and fame, and that these logics shape the way digital infrastructures and platforms are developed and coded. Operating as mechanisms and techniques of the settler colonial state that work to manage Indigenous differences via settler anxieties and settler structures of feeling and affect, if these structures are settler colonial technologies propelling liberalism and capitalism, I argue that it is necessary to interrogate how their embedded logics undermine, complicate, and disrupt Indigenous ways of knowing and being, including relationality and kinship.

Presenter(s): Kaylen James

Between life and death worlds: Earth, state, and the Indigenous ordinary

On December 13, 1984, 123 Quechua community members were executed by the Peruvian military and left in a mass grave in Putis in the region of Ayacucho, Peru. They were among the approximately 70,000 lives (the majority of whom were Indigenous) estimated to have been lost during Peru's internal armed conflict, escalating through the 1980s and 1990s. Centering the role of Indigenous research in service of repair, restoration, and regeneration of our distinctive worlds, this

presentation examines individual and collective memory and human and earth rights work alongside narratives of grief and loss in the Andes. Through three concurrent layers of Andean Quechua research—historical research on gender-based violence through the Peruvian hacienda era, the connections between the internal armed conflict and recent protests for democracy, and a discussion of Indigenous community-led human and earth rights movements, I consider the relationship between Indigenous community members and the state, fraught since colonial and independence eras. Linking contrasting ideas of humanity, selective citizenship, and the disposability of the Indigenous human and more than human, I describe the Indigenous ordinary as an ontological-pedagogical-analytical frame for contesting colonial capital and recognizing human agency as a process of embedded earth relations that rethinks nationhood, community, place, and belonging on Indigenous terms.

Presenter(s): Elizabeth Sumida Huaman

Autoethnography as a fourth axis: Embodied displacement, multispecies care, and comparative research in crisis

This paper explores how embodied displacement, relational autoethnography, and multispecies care practices can deepen Indigenous and endogenous research methodologies in times of crisis. Drawing on fieldwork amid Lebanon's rapid descent into war in late 2024, I propose the autoethnographic self as a fourth axis of Comparative Case Studies. This expansion challenges dominant separations between researcher and field, human and more-than-human, method and life. In the aftermath of the Twin Attacks and resulting mass displacement, my family's survival practices, ranging from nurturing routines with cats under bombardment to the preservation of cultural memory through music during the Lebanese Civil War illuminated profound relational ecologies that sustain life amid systemic collapse. I argue that knowledge production in sites and times of crisis must attend to the intimate, embodied labor of care, hope, and relational endurance. Attuning to multispecies companionship, emotional geographies, and intergenerational histories of displacement, I center temporal resilience as a form of Indigenous ecological knowledge that insists on life despite rupture. The paper advances a methodological intervention that scholars from conflict-affected contexts treat their lived experience as method, archive, and analytic, radically expanding ethical and epistemological possibilities, repositioning routine and relationality as refusal against violence and environmental devastation.

Presenter(s): Samira Chatila

'iceyéeye [Coyote] Is Play and Sport: Indigenous Methodologies of Playful Pedagogy for Teaching and Learning Niimípuu Language and Stories

This paper is grounded in Indigenous educational and anthropological observations and inquiry. Focusing on Niimípuu fundamental pedagogical concepts, including the role of 'iceyéeye [Coyote], I describe Indigenous play and sport as part of Indigenous journeys for children and community members to discover reimaged ways of learning and teaching that address equitable ways of

knowing and land-based pedagogies toward the creation of methodologies of playful pedagogy for teaching and learning Niimípuu language and stories.

6375 Ectoplasmic Traces: Symbolic Regimes and Alternate Imaginaries

Start Date: 11/20/2025 4:15 PM **through** 11/20/2025 5:45 PM

Venue: Sheraton **Room:** Napoleon BR B1 (3rd fl)

Type: Oral Presentation Session

Ghosts imply the presence of the past--something or someone that should have been erased from reality but still haunts. Ghosts can take many forms, manifesting through colonial violence, epistemic erasure, and imperial desires. This panel explores how such presences shape contemporary struggles for justice, recognition, belonging, and memory across different geopolitical and historical contexts. Drawing from ethnographic research in the borderlands, legal systems, transborder diasporas, online consumption, and revolutionary legacies, this panel demonstrates how the spectral is entangled with power and resistance.

This panel is transnational; while each paper highlights the specificities of a particular region and theme, they connect more broadly to understand how ghosts--whether as memories, traumas, imagined empires, erased figures and narratives, or relics--provide a lens to counter and strengthen dominant discourses and histories. Each paper highlights tensions of power between historical imaginings and contemporary realities: how settler histories materialize in Texas, how colonial legacies of law perpetuate discrimination in Bangladesh, how imperial nationalist visions of history trickle through current digital markets, and exploring political contestations over guerrilla symbolic heritage in Colombia.

Paper 1 examines how ethnic violence on Indigenous communities and settler colonial imaginaries structure racialized forms of systemic violence on the US-Mexico borderlands. Demonstrating the complexity of power and resistance, Resendiz highlights how local communities contest these white supremacist imaginaries in Texas and beyond.

Paper 2 investigates digital legal databases locating the systematic erasure of Muslim women's experiences of law. Drawing on fieldwork from state courts and Islamic/customary courts in Bangladesh, Hoque explores how law is mediated in technology, highlighting how databases reinscribe the hierarchies and epistemic frameworks of Western legal systems, which is in part a legacy of colonialism.

Paper 3 explores the proliferation of imperial nationalisms and nostalgias among the material culture of the Iranian diaspora with a focus on online consumption. Mostafavi examines how ideas of a pure Persian culture and nation haunt objects as imperial specters, erasing the long history and presence of other racial, ethnic, cultural, and religious groups in Iran and in the diaspora.

Paper 4 critically examines the Colombian context, delving into the ongoing contest surrounding FARC's symbolic heritage between demobilized and non-demobilized fighters. It specifically focuses on the imagery associated with the guerrilla's deceased founder, "Manuel Marulanda," and analyzes how this representation intersects with propaganda and consumer advertising, as well as the Cold War's afterlives in Latin America.

Presentation(s): Specters of the Borderlands: Labor, Memory, and Violence in the Making of the Modern Mexico-Texas/US Border

The US-Mexico borderlands are among the most imagined and increasingly militarized landscapes of the 21st century. Often depicted as lawless and perilous, they are both portrayed as ahistorical while materially functioning as necropolitical carceral sites for undocumented border crossers. Much like Gloria Anzaldúa (1987) referred to the US-Mexico border as "an open wound," the phantasms of how the modern border was forged linger in the memory of borderlands peoples. These specters include the legacy of Indigenous land loss, ethnic violence, military conflicts, and, most importantly, the resistance exercised by subaltern communities to colonial violence spanning the past four centuries.

This paper demonstrates how local and Indigenous communities, alongside memory workers—filmmakers, artists, and historians—labor to reckon with the phantasmagorical wounds created in the process of making and knowing the borderlands as a site of historic colonial incursions and as a space of life and resistance. Drawing on over a decade of multimodal documentary fieldwork, interviews, and collaborations across Texas, this work presents an archive of the material and aestheticized environs from central Texas to the Rio Grande, exposing the clashing of distinct visualizing colonial regimes as well as the discursive and material production of settler iconographies, in/visibilized histories, imagined mythologies, and acts of resistance materially inscribed across the landscape.

Presenter(s): Ramon Resendiz

Exorcising Data: Legal Pluralism in Bangladesh

Drawing on the concept of legal pluralism, which promotes studying law outside of state-centric and Eurocentric frameworks, my paper provides insight on how Muslim women's experiences and frameworks of justice are erased when emerging technologies are designed to treat law as singular and universal. I demonstrate my argument through two years of ethnographic fieldwork in Bangladesh, analyzing what kinds of cases get recorded in databases and who makes these decisions, countering the idea that databases are exhaustive and inclusive. Outside of state law,

community-led customary courts called shalish that draw from Islamic legal philosophy are prevalent. I explore how rural women's testimonies and Islamic legal frameworks are mistranslated and miscategorized as cases move from shalish to state courts, and then from state courts to digital legal databases. Analyzing databases centering on the ghostly figures – those who are barred from fully living in the "real" world – provides a lens to see the continuing epistemic violence on groups who have been historically marginalized. Digital databases influence how knowledge and worldviews are mediated online, leading to ideological and material consequences that can deepen Muslim women's marginality in unexpected and perhaps unintended ways. As such, it is important to locate the ephemeral apparitions that appear through resistance despite the rigorous attempts to "exorcise" and "cleanse" them.

Presenter(s): Salwa Hoque

Ghosts of Empire: Imperial Hauntings in the Iranian Diaspora

In 20th-century Iran, the Pahlavi monarchy sought to "exorcise" the backwardness of a country seen through Western eyes, to create a nation simultaneously ancient, having existed unchanged for over 2500 years, and modern, exorcised of "backwards" Islamic traditions and superstitions. Such a nation-building project was also an exercise in cultural and racial purity as the state presented Iran as a culturally Persian, racially Aryan nation, excised of Arab, Mongolian, and Turkic influences.

Despite the fall of the monarchy in 1979, the Iranian diaspora remains haunted by an imperial nostalgia (Malek 2023, forthcoming), yearning for the aesthetics of empire. This paper examines how the convergence of imperial nostalgia and Persian-centric nationalism circulates within the material culture of the Iranian diaspora, focusing on online consumption. As spirits haunt things, I examine the differing notions of an Iranian nation that possess these objects, the ghosts of an imagined and constructed Persian empire. Imperial ghost sightings abound: in high-fashion luxury purses, in independently-designed jewelry, and in decorative plates glazed with Pahlavi faces. I argue that digital markets aid in the generation of these phantoms while appropriating and erasing the long history and presence of other racial, ethnic, cultural, and religious groups in Iran and in the diaspora. Market ideologies infect diasporic politics, turning potential solidarities into fantastical apparitions.

4470 Shadows: Addressing Our Past, Reconciling the Present within the African Diaspora

Start Date: 11/20/2025 4:15 PM **through** 11/20/2025 5:45 PM

Venue: Sheraton **Room:** Napoleon BR B2 (3rd fl)

Type: Oral Presentation Session

We believe that there is an epistemological dissonance on how continental Africans, Afro

Caribbeans, and African Americans (black people) experience the legacy of colonization. From an equitable lens, our research aims to empower black youth and young adults to build sustainable lifestyles. As researchers of the African Diaspora, we posit that black youth and young adults within our global community have the capacity to promote sustainable community development. Therefore, an applied anthropology curriculum needs to be developed to inform our global communities about its respective members.

As applied anthropologists researching educational praxis, we are concerned with how educational institutions articulate the shared legacies and lived experiences of black people. Using mixed methods, we will create a science and art-based curriculum that dismantles cultural boundaries and promotes sustainable development through literary and digital arts, visual expression, and scientific analysis, but before said development, data needs to be collected to ensure that our model is inclusive. We will collect our data via panel discussions, focus groups, and questionnaires.

All of our proposed panelists are members of the African Diaspora and their work collectively endeavors to 1) repair historical injustices among black people of the African Diaspora, 2) improve the appreciation of cultural diversity within the African Diaspora by gaining mutual respect for black communities and their struggles due to colonization, and 3) increase the awareness from an etic perspective, the contributions of black communities across the world in creating sustainable environments, relationships, and lifestyles.

Presentation(s): Group Positionality in a multi-cultural Society: The Case of the Garifuna of Belize

The Garifuna people enjoy a unique position in the Caribbean demographic landscape, being both indigenous and Afro-descendant. Their journey to Belize in the Western Caribbean was the result of warfare, resistance, and refuge-seeking beginning in the early 19th century. In modern Belize, they are one of several ethnic groups that make up the ethnic and cultural landscape. This paper explores their legacy of struggle and adaptation in Belize's socio-economic and political context and through archival research and interviews with key leaders of the National Garifuna Council examines their self-perception of belonging, resource access and political representation in Belize's multicultural context.

The Garifuna people hold a unique position in the Belizean and broader Caribbean sociocultural landscape, as both Indigenous and Afro-descendant. Their migration to Belize in the early 19th century was shaped by a history of warfare, resistance, and the pursuit of refuge. In contemporary

Belize, they are one of several ethnic groups contributing to the country's rich cultural mosaic. This paper explores the Garifuna's legacy of struggle and adaptation within Belize's socio-economic and political contexts. Drawing on archival research and interviews with leaders of the National Garifuna Council, it examines how the Garifuna perceive their belonging, access to resources, and political representation in Belize's multicultural society.

Family Heritage Books on Every Coffee Table, in Every Classroom

To reconcile historical disconnects and harmonize dissonance related to the Atlantic Slave Trade and its aftermath, twenty-first-century African Americans collaborate across the diaspora, publishing genealogy books (family heritage books). This paper uses music to illustrate how the Agapic Agency Theory, derived from these genealogies, illuminates their content. The theory unfolds in three parts, mirroring core functions of Black genealogies: spiritual ancestral connection via Deep Roots, intellectual understanding through Deep Knowledge (interpreting oral history and records), and embodied positive ancestral self-identity revealing Deep Self. Crafting this identity involves seeking an ancestral home—domestic surroundings rich with heroic ancestors, accessible information, and opportunities for spiritual connection and reenactment of virtuous lives. Descendants find this home by engaging with ancestral legacies within their genealogy books. Thus, Deep Roots, Deep Knowledge, and Deep Self are both recurring themes and the interacting components forming the Agapic Agency Theory. The paper concludes with practical pedagogical applications for Black genealogy book research, teaching, and exhibition.

Presenter(s): Pamela E Foster

Black for the First Time: Black Community Identification through Racial Socialization at a Historically White Institution

This article examines Black undergraduates' racial community self-discovery at a Historically White Institution (HWI), focusing on the transition from non-identification to identification with the Black community. Challenging the assumption that racially minoritized individuals are invariably socialized within their racial community, this study distinguishes community orientation from racial identity to clarify diverse experiences within the Black community. Considering varied socialization informs strategic interventions to engage Black students. The article highlights Black students entering college without Black community identification, explores Black student socialization through cultural capital and Community Cultural Wealth theories using ethnographic examples, and introduces "hubs of cultural socialization." Interview data from Black undergraduates and a faculty member illustrate how students developed Black community identification during college. This work informs recommendations for Black students and HWIs to facilitate access to desired Black community socialization.

Presenter(s): Jamaal Muwwakkil

Cultural Border Crossing: Developing a Sustainable Educational Curricula for the African Diaspora

Our research posits that all black youth and young adults in the African Diaspora acquire the knowledge and skills needed to promote sustainable development in their respective communities; however, we believe that there is a historical disconnect, or epistemological dissonance on how continental Africans, Afro-Caribbean, and African- Americans (black people) experience the legacy of colonization. Research supports that science and art heal and transform marginalized communities and those affected by traumatic experiences. Using data collected from our qualitative study, our work endeavors to 1) repair historical injustices among black people of the African Diaspora, 2) improve the appreciation of cultural diversity within the African Diaspora by gaining mutual respect for black communities and their struggles due to colonization, and 3) increase the awareness from an etic perspective, the contributions of black communities across the world in creating sustainable environments, relationships and lifestyles.

3366 Ghosts of Violence, Spirits of Resistance, and Reimagining Collective Safety

Start Date: 11/20/2025 4:15 PM **through** 11/20/2025 5:45 PM

Venue: Sheraton **Room:** Napoleon BR B3 (3rd fl)

Type: Roundtable/Town Hall

Ghosts of Violence, Spirits of Resistance, and Reimagining Collective Safety

What lingers in the spaces between law and disorder, security and repression? This roundtable explores how ghosts - of state violence, failed reforms, colonial legacies, and lost futures - haunt policing practices and policed communities around the globe. We attend to the spectral dimensions of policing, not only as traumatic afterlives of violence but also as forces that generate resistant political imaginations, communal care, and alternative visions of safety. Across Brazil, Turkey, Kenya, the US, Jamaica, Venezuela and Thailand, we explore how haunting also opens space for reimaginings of justice, care, and community self-determination. Our panelists engage with themes such as (mis)trust, informal order, militarization, and the often blurred lines between authoritarianism and democratic aspiration, drawing on ethnographic fieldwork to surface how communities live through and respond to these spectral inheritances. Each participant will offer a short provocation, grounding their insights in specific sites and histories. These will be followed by rotating small-group conversations to foster interdisciplinary and transnational dialogue. Together, we trace the haunted contours of policing-and the possibilities that emerge when people respond not only with fear or resistance but with creativity, care, and collective refusal.

2847 Lessons from the ghosts of food recommendations past, present, and future

Start Date: 11/20/2025 4:15 PM **through** 11/20/2025 5:45 PM

Venue: Sheraton **Room:** Napoleon BR C1 (3rd fl)

Type: Oral Presentation Session

Food guidance is never neutral. Recommendations about what to eat continually shift, reshaped by science, politics, moral frameworks, racialized hierarchies, and cultural memory. Yet, each revision carries traces of past ideologies, lingering as ghosts that influence current behaviors and future trajectories. These evolving recommendations often generate uncertainty as communities navigate contradictions and complex historical legacies embedded within contemporary guidance.

This session brings together scholars examining the palimpsest of food recommendations and their complex effects on present-day behaviors, values, and inequalities. What emerges is a layered conversation about how public health messages, policy shifts, sensory memory, and archival voices continue to haunt and shape food systems today. Each paper examines how people, especially those vulnerable or navigating marginalized food landscapes, make sense of evolving advice and what these recommendations carry forward from the past.

Together, the panel explores: 1) evolutionary perspectives on human diets and their contradictions with modern nutritional policy; 2) parental experience and anxiety stemming from recent shifts in infant allergen introduction guidelines in the United States that contradict previous guidance; 3) public health messaging in Madagascar and its unintended role in increasing consumption of processed foods due to hygiene concerns; 4) how memories of school lunches influence parents' attitudes toward interaction with the school food programs of today; 5) how archival Black American cookbooks encode values and sensory knowledge to that engage in a radical and liberatory pedagogy.

This session foregrounds the dissonance between lived experience and institutional food advice. What lessons can we learn from the ghosts of food recommendations past? How do lingering policies continue to shape present-day decisions? This session will explore the evolving nature of how we come to know about the food we eat, the forces that drive change, and how we can avoid repeating the mistakes of the past.

Section: Society for the Anthropology of Food and Nutrition

Southern Methodist University, Department of Anthropology

Presentation(s): Ghosts of the deep past: Evolutionary dietary guidance

Proponents of an evolutionary approach to nutrition have challenged standard government-sanctioned dietary guidelines, offering alternatives based on foods available to early human foragers. Both forms of guidance typically categorize foods into food groups based on their nutrient contributions. Food groups that commonly appear in standard guidance are grains/starchy staples, fruits and vegetables, dairy, and protein foods (i.e. animal sources and legumes), while those inspired by evolutionary nutrition typically remove dairy and grains and emphasize fruits, vegetables, nuts and seeds, meat, seafood, and eggs. I argue that this reliance on food groups in dietary guidance misses the deeper evolutionary meaning of the nutrient composition of foods. I consider the ancestral, biological continuity between humans and their foods and ask: Why does a food provide its particular array of nutrients? What were those nutrients doing in the eaten organism? All organisms share fundamental life history tasks and have associated anatomical structures. Eating food means consuming a part or all of an organism engaged in life history functions. Nutrients play central roles in those functions and are used by humans in species-specific ways. By aligning nutrients with functional anatomy we find patterns in nutrient availability, better understand why foods have particular nutrient profiles, connect humans and foods in new ways, and can frame a new kind of evolution-inspired dietary guidance.

Presenter(s): Andrea Wiley

Presentation(s): Parental anxiety in an ever-changing food allergy recommendation landscape

Recent U.S. recommendations now encourage early introduction of allergens such as peanuts and eggs as early as

4–6 months of age, a notable reversal of previous advice. Although these updated recommendations are firmly rooted in emerging scientific evidence in food allergy prevention, little research has been focused on how these substantial changes have created confusion, anxiety, and stress among caregivers. Here, we present preliminary findings that examine how food anxiety is shaped by changing public health narratives, social media, and cultural expectations. Semi-structured interviews and validated surveys were conducted with mothers of infants undergoing complementary feeding in North Carolina, where pediatric food allergy rates have increased by over 300% in the past decade. Additionally, digital ethnographic techniques were used to capture the current information landscape of food allergy advice on social media platforms. This study addresses an urgent need to understand caregiver experiences, perceptions, and choices amid shifting public health guidance and new information sources.

“Healthy food is clean food “: Food hygiene public health messages as drivers of processed food consumption in northeastern Madagascar

The Nutrition Transition refers to dietary changes as populations increase consumption of ultra-processed food, and then suffer from associated non-communicable diseases like hypertension, heart disease, and diabetes. Most commonly associated with economist Barry Popkin, the nutrition transition is often portrayed as a linear process resulting from large-scale forces like urbanization and globalization. Yet ethnographic research shows that the nutrition transition is hardly standardized, as cultural norms and socio-economic forces profoundly shape this process. This presentation will explore how this global phenomenon is playing out in the Maroantsetra region in northeastern Madagascar, based on in-depth interviews and participant observation over 4 months in 2022. Interviewees who were middle aged and elderly frequently noted the sharp contrast between what they ate growing up, and what their children and grandchildren are now eating. Packaged foods, once rare, are now daily purchases. One surprising reason is that open-air markets and prepared food stands have been portrayed in public health messaging as potential vectors of disease from flies, dust, and vendors' unwashed hands. Thus, local definitions of "healthy" are haunted by concerns of cleanliness, and hygiene public health messages combine with changing gender norms, financial constraints, and new ideas of proper parenting, to drive the nutrition transition in this region of the world.

Presenter(s): Laura Tilghman

‘My ancestors tell me when to stop’: Engaging with cookbooks as vectors of food values and sensory knowledge

Cookbooks allow cooks of all skill levels to document and preserve their recipes, special techniques, and the stories that come with cooking. This preservation extends a chef's expertise beyond its face to face limitations, and allows them to influence present day cooking and eating. These texts become instructional manuals that rely not only on what's written on the page but embodied knowledge that must be bodily and sensorially engaged. They also encode unspoken values in how we prepare certain dishes and regard certain ingredients (Forster 2023). This form of writing is a generally important literary form, but especially so for Black Americans. Cookbooks describing and engaging with the contributions of Black Americans, which have been marginalized and denigrated, instead document and preserve a significant culinary tradition (Fretwell 2020).

I will use archival materials at the SMU Degolyer Library's Cookbook Collection and UA David Walker Lupton African American Cookbook Collection to examine the change over time in the narratives encoded within cookbooks. I will view the ways that ideas about food can linger in our memories and on our plates in the present, resulted in an embodied learning that is translated to the page. I will use these texts to explore the sensorial aspects that are documented in cookbooks, and a new way of learning from and with our predecessors—ghosts of a time past (Jenks 2022).

Presenter(s): Carolyn Mason

8091 Ethnographic Hauntings: Engaging Improvisation and Historicity Towards Reimagining Methods in Educational Anthropology

Start Date: 11/20/2025 4:15 PM **through** 11/20/2025 5:45 PM

Venue: Sheraton **Room:** Napoleon BR C3 (3rd fl)

Type: Oral Presentation Session

Building on the ways educational anthropology has been shifting to confront the global nature of racial injustice as directly tied to racial capitalism and colonialism (e.g. Abu-El Haj, 2015; Bartlett & Brayboy, 2005; Villenas 2009), this session grapples with the spectral presence (Gordon, 1997) of colonial, racialized, and disciplinary practices that continue to shape methodological approaches to educational anthropology. Drawing from the meeting theme "Ghosts," we reflect on how taken-for-granted methodological traditions in anthropological research, whose histories are inextricably shaped by US/European colonialism, continue to haunt research practices. Similarly, ongoing practices of genocide and dispossession are both haunted by the past and create conditions for hauntings of peoples experiences.

We recognize the need to simultaneously engage in critique and world building; this symposium addresses two core questions: (1) What is required to imagine educational spaces free of racial injustice? (2) How can we center methodologies, humanizing pedagogies, and liberatory theorizing that change the conditions for everyday people? We center improvisation as both an analytic and methodological orientation.

Contributors to this session draw from field-based education research situated in community-based learning, afterschool programs, classroom context, and performance spaces. Presenters take up the possibilities of improvisation as a generative practice that can move educational relationships and encounters toward joy, justice and transformation. Improvisation is treated not as mere spontaneity but as a deeply relational and historically aware practice that navigates structural constraints while holdings pace for emergent possibilities. We address some structural and epistemic tensions within educational anthropology, and consider how improvisational methodologies may interrupt inherited disciplinary practices. Marin and Lindberg disrupt Cartesian ways of knowing in interaction analysis that privilege talk as a primordial locus of analysis. Harb examines how improvised dialogues in community radio can unsettle raciolinguistic hierarchies. Gzehoviyak, Harris, and García-Sánchez center immigrant youth as rightful analysts of their own experiences and elevate their improvisational stories as legitimate representations of their own communities. Finally, Ali confronts the silences and absences in ethnographic archives to illuminate how racialized surveillance shapes knowledge, offering an improvisational methodology that treats absence as both evidence and method.

Framed by session co-chairs and concluding with a discussant-facilitated dialogue, this symposium invites educational anthropologists to reimagine the political, historical, and affective dimensions of methodology. In doing so, we seek to confront the haunting of our inherited methods while envisioning methodologies grounded in liberation, solidarity, and ethical attunement.

Presentation(s): “I’m just talking, and you should too!”: Restructuring Raciolinguistic Hierarchies through Methodological and Pedagogical Improvisation

This paper explores how methodological and pedagogical improvisation shaped my ethnographic engagement with a community-engaged Spanish-language conversation course at a predominantly white liberal arts college in the New Latino Diaspora (Hamman, Wortham & Murillo 2015). Taught in collaboration with a local Spanish-language community radio program, the course brought students and community members together to record a weekly radio segment about socio-political issues that affect the Latinx immigrant community. Drawing from student interviews, archival radio data, and field notes gathered across three iterations of the course during 2020-21, my analysis centers around how the Latinx students reproduced and resisted raciolinguistic ideologies (Rosa and Flores 2017) in their valuation of their own and others' language practices. I argue that engaging in improvised dialogue with local community members and activists in Spanish/Spanglish ultimately disrupted the deficit framing of their sociolinguistic position. Centering the experiences of emergent Latinx bilinguals (García 2009), this paper builds on scholarship that is reimagining educational research and practice through social justice-oriented (Cammarota & Romero 2009), culturally sustaining (Paris & Alim 2014), and translanguaging pedagogies (García & Sánchez 2021) orientations to help shift our gaze away from structures of white supremacy and coloniality and towards sociolinguistic justice in the language classroom.

Disrupting Adult-Centeredness: Immigrant Youths’ Improvisational Storytelling for Transforming Community Representations in Educational Anthropology

Educational anthropology has a long history of privileging adult perspectives – such as those of researchers and community members – in research representations of minoritized communities. Drawing on community-based work conducted among Oaxacan immigrants in Southern California, this paper examines a series of improvisational stories composed by children in collaborative groups in an afterschool program. Anchoring our work in Childhood Studies (Bluebond-Langner & Korbin, 2007; James & Prout 1997), which centers youth as rightful analysts of their social worlds, we examine how children took turns adding to the story until they all agreed on an ending. Within this pedagogical framework, improvisation was deployed to encourage children to (re-)imagine representations of their communities, accommodating both critiques of inequalities in their daily lives and also their constructions of a more just society. We center improvisation as an analytic and methodological orientation that engages children's agency in representing their worlds through their own eyes, while rehearsing ways of envisioning social transformation. Inspired by Enciso's

(2017) call to "engage with the ongoing politics of imagination in everyday life across silenced histories and uncertain futures" (p. 29), this paper has implications for how improvisational approaches to ethnography can create research and pedagogical spaces in which immigrant youth can engage in both just critique and joyful world-building

The Unwritten and Unseen: Haunting, Surveillance, and the Coloniality of the Ethnographic Archive

This paper engages the spectral dimensions of ethnographic research in educational anthropology, exploring how archival absences, silences, and truncated speech in fieldwork with Muslim youth are sites of epistemic tension and suppressed possibility. Drawing on Gordon's (1997) theory of haunting, Hartman's (2008) critical fabulation, and Morrison's (1987) concept of rememory, I develop an Epistemic Analytic of Absence (EAA) to examine how surveillance, racialization, and liberal modernity shape what is sayable, and knowable in ethnographic archives. Through a close analysis of a transcript with a politically active Muslim student, I show how hesitations, silences, and refusals mark moments of resistance that challenge dominant frameworks of legibility and complicity.

The paper asks how educational ethnography—often shaped by logics of documentation, legibility, and institutional containment—might be unsettled through methodological orientations attuned to absence, rupture, and speculative possibility. These absences are structured by racialized governance. This project offers a decolonial analytic that treats the unsaid as both evidence and method, inviting researchers to attune to the hauntings that emerge in the field and in the archive. It reimagines ethnographic improvisation as a historically grounded and relational practice—one that listens to silences, resists closure, and creates space for alternative ways of knowing and being in educational contexts.

Discussion

3992 Towards an anthropology of disinformation

Start Date: 11/20/2025 4:15 PM **through** 11/20/2025 5:45 PM

Venue: Sheraton **Room:** Napoleon BR D1 (3rd fl)

Type: Roundtable/Town Hall

Contrary to the debunking agenda of some research programs, this roundtable argue that the aim of an anthropology of disinformation should not be to identify false information per se, nor to pinpoint knowledge claims as "right" or "wrong." Instead of being prescriptive, an anthropological approach toward disinformation is an interpretative exercise that attempts to foreground the phenomenon within specific cultural contexts, rational motivations, social pressures, power plays, and

technological networks. While disinformation remains poorly studied in anthropology, this roundtable examines how the discipline possesses a rich taxonomy of terms that closely echoes sub-aspect of disinformation, hereby throwing the basis for an anthropological study of disinformation. We also discuss how anthropological research methods (such as participant observation and in-depth interviews, among others) foster a different take on disinformation studies, by underscoring the context of production in which "dubious" narratives happen and by interpreting the internal logic of agents embedded in claims of disinformation.

3497 The Ghost of Power Relations: Legacies of Past Policies and Structural Arrangements

Start Date: 11/20/2025 4:15 PM **through** 11/20/2025 5:45 PM

Venue: Sheraton **Room:** Napoleon BR D2 (3rd fl)

Type: Oral Presentation Session

We live in a world filled with ghosts-the legacies of past policies, institutional setups, human geographies, and ideologies that are intertwined in sometimes mutually contradictory ways and structure our lives. Even when we currently dismiss or disapprove of these past structural arrangements and ideologies due to their racist, sexist, and other problematic assumptions, these ghosts continue to "haunt" us. Walter Benjamin (1968) once argued that social transformation comes from shifting the way we relate to reality, which is formed in the forcefield between art and technology. Such perceptions of reality develop in our daily tactile experiences that turn into habits-e.g., films that turned "cult followers" of art into critics or certain architectural setups that we experience while being distracted. This session

examines such daily experiences and traces the legacies of past structural arrangements that are informed by specific ideologies-"ghosts"-that we may no longer believe in, because of the injustice and inequity they created, yet continue to shape our daily lives and the ways in which we connect to reality. By bringing these ghosts to the surface of our understanding, the papers in this session seek to identify the issues that need to be tackled and explore ways to create a more socially just society. The first paper analyzes the narrative of the "bad neighborhood" that must be avoided in the US, as shaped by the past policies ("ghost") of red-lining, the War on Poverty, the War on Crime, and the War on Drugs, all informed by racism. By pointing out the slippage of space and people that hides the blatant demonization of residents in such neighborhoods, this paper explores ways to humanize them as a first step to end this narrative. The second paper examines the erasure of Japan's colonial history ("ghost") in Japanese-as-a-Foreign-Language textbooks. Drawing on an

autoethnographic account of the author, a Zainichi Korean, and interviews of students from Japan's former colonies, this paper calls for the necessary addition of diverse voices in language textbooks in order to avoid further marginalization of such students. The third paper investigates the "ghosts" of the ideologies of standardization and appropriateness in the notion of immersion in a study abroad context. Based on interviews of students who studied abroad in France, this paper examines the ways linguistic policing based on this notion interacts with racial dynamics among students. The fourth paper shows the "ghost" of the language standardization ideology and the nation-state ideology behind it that structures Chinese and Japanese Foreign Language classrooms at a US college. This paper introduces a new pedagogical design that challenges these ideologies. Together, this session seeks to reveal these layers of historical structural arrangements in order to challenge them.

Presentation(s): The "Bad Neighborhood" Discourse and the Ghosts of Past Policies

This paper examines the "ghosts" of racist policies in the notion of the "dangerous neighborhood" that designates a space of criminality and serves as code for a neighborhood of "poor, non-white people," who are demonized as criminals based on media descriptions rather than actual crime rates. DiAngelo (2016) argues that this "Danger Discourse" is currently socially acceptable thus perpetuates racism. Based on an interview of a driver who is scared of "dangerous neighborhoods" and the author's autoethnographic account of working in a "dangerous neighborhood," this paper examines the operations of Danger Discourse and traces its "ghost"—historical structural arrangements: redlining policies that created urban poverty (Aalbers 2014) and the Wars on Crime, Poverty, and Drugs that connected race, poverty, and criminality and made urban, non-white, low-income communities the target of aggressive policing and incarceration (Hinton 2016; Lassiter 2015; Thompson 2010). This paper points out the problematic slippage between people and space, which spatializes and thus objectifies residents, hiding the blatant demonization of these people as "bad," in the Danger Discourse and suggests instead humanizing these residents as people who are hard workers, who are offended by such Danger Discourses, and who themselves suffer from crime. By bringing this "ghost" to the forefront, this paper explores ways to change this landscape of fear that inspires racism.

Presenter(s): Neriko Doerr

Ghost of Colonialism: Power and Silenced Voices in Japanese Language Textbooks

Some Japanese-as-a-Foreign-Language (JFL) textbooks lack sensitivity toward learners from diverse backgrounds. These materials are not just educational tools but also spaces where power dynamics determine whose histories are remembered and whose are erased. The suppressed history of Japan's colonialism lingers like a ghost, haunting marginalized JFL learners. This paper examines the portrayals of Shinto shrines and the atomic bombings in JFL textbooks. Shinto shrines are often depicted as peaceful in these materials. However, numerous shrines were built in Japan's colonies, where shrine rituals were imposed on all imperial subjects regardless of faith (Henry 2014). Such omissions reflect a broader system that privileges colonial narratives while silencing other voices, as this paper argues. Similarly, many JFL textbooks frame Japan solely as a victim of World War II, particularly in their descriptions of the atomic bombings. Japan's role as an aggressor in its colonial actions remains unaddressed. Drawing on the author's experience as a third-generation Zainichi Korean teaching Japanese, as well as interviews with JFL students who express frustration over such textbook portrayals of Japan, this paper explores why rethinking these materials is crucial for addressing colonial legacies—these "ghosts"—and power dynamics in language education.

Presenter(s): Jisuk Park

Exorcising the Ghosts of Linguistic Appropriateness in Study Abroad

Recent work in sociolinguistics challenges the concept of autonomous, bounded languages and takes a critical stance toward Standard Language ideology (SLI). SLI is maintained, in part, through "appropriateness" models of linguistic diversity management, which assign specific language practices to particular domains. Appropriateness has been charged with perpetuating racism and linguisticism. However, like lurking ghosts, SLI and ideas of appropriateness still undergird language-in-use practices in study abroad programs, some of which require students to sign "language pledges" to use the target language exclusively. This paper presents the findings of a study that examined how SLI circulated in the talk of 15 U.S. students studying abroad in France. Drawing upon interview data, the analysis traces how students self-surveilled and imposed "appropriateness" models of language education upon themselves. Most participants drew upon geographical imaginaries that idealized ties between French and France, the nation-state, and they hoped to pass as French in public spaces. They also castigated themselves for using English during communicative breakdowns. Participants who reported violating the language pledge, however, were often students of color; they experienced racialized incidents and used their wider linguistic repertoires to build community. These findings underscore the uneven effects of SLI on individual people, and they point to a reconsideration of language pledges.

Presenter(s): Cora Jakubiak

Fighting the Ghosts in Modern Language Education

Why do we teach and learn modern languages with such a single-minded focus on proficiency in a single named language? This paper examines how treating languages as bounded, teachable objects is a legacy of the "ghosts" of power relations in modern language education, particularly nation-state language ideologies and the ahistorical foundation of proficiency-oriented communicative language teaching. The resulting narrow mission of modern language education risks losing relevance for students, as technological advancements based on large language models render mechanical language skills less essential and critical thinking becomes increasingly vital. This paper presents the development of a new course, Histories and Contexts of East Asian Languages: Identities, Politics, and Diverse Language Contexts, offered at a small liberal arts college with Chinese and Japanese language programs, as an effort to fight these "ghosts" in modern language education. The course explores the premodern histories of the two languages, the standardization of 'national language', and language education in diverse sociopolitical contexts, to help students critically examine the sociopolitical dimensions of modern language education. As a culminating project, students will create supplementary materials for beginning Chinese or Japanese language courses, providing historical and contextual insights often absent from conventional curricula and teaching materials.

4398 Haunted by Policy: Specters of Dismantling, Displacement, and Disappearance

Start Date: 11/20/2025 4:15 PM **through** 11/20/2025 5:45 PM

Venue: Sheraton **Room:** Rhythms I (2nd fl)

Type: Oral Presentation Session

This panel examines the invocation of historical ghosts and spectral afterlives of current federal policies and actions, focusing on the populations, institutions, and futures that were targeted, dismantled, or rendered invisible. These policies have left behind more than political debris; they have generated social absences, institutional voids, and lingering traumas that haunt communities – in the US and abroad. The papers examine the enduring "ghosts" of policies enacted during the Trump administration, focusing on the populations, institutions, and communities that have been marginalized, dismantled, or rendered invisible. Presenters reflect on these topics from a historical and/or anticipatory perspective.

Presentation(s): The Vanishing Agency: Disorientation, Disillusionment, and the Dismantling of USAID

This paper explores the disorienting and disillusioning effects of institutional dismantling at the U.S. Agency for International Development (USAID), which became a central target of restructuring in the early weeks of the second Trump administration. Drawing on interviews with USAID Foreign Service Officers (FSOs), it looks at how FSOs have experienced the erosion of their agency's mission and meaning.

As FSOs contend with shifting mandates, suspended futures, and a vanishing sense of purpose, their stories reveal a professional haunting shaped by disorientation, disillusionment, and spectral institutional memory. Many express deep concern not only for their own roles but for the fate of critical development and humanitarian projects they have overseen across the globe—initiatives now left unfinished, under-resourced, or abandoned.

This study contributes to conversations on the lived realities of policy actors, the affective dimensions of bureaucratic labor, the vulnerability of state institutions, and the global consequences of domestic political shifts. By foregrounding the voices of those tasked with enacting U.S. development policy abroad, the paper contributes to broader conversations about the afterlives of institutions under attack—and the forms of disappearance and displacement they leave behind. It also raises questions about the unsettling of long-standing structures of global aid and governance and the reshaping of the field of International Development.

Presenter(s): Caitlin Fouratt

Erased But Not Forgotten: The Spectral Violence of U.S. Asylum Policy and the Afterlives of Resistance

Drawing on my work as anthropologist and expert witness in asylum cases, I examine the spectral dimensions of U.S. immigration policy through the lives of Guatemalan women and LGBTQ+ individuals who have long resisted a life structured by erasure. These individuals—whose very survival challenges state-sanctioned silencing—exist at the crossroads of multiple violences: patriarchal, heteronormative, and geopolitical. Their flight is not only from individual persecution, but from deeply embedded structural forces that have attempted to render their lives illegible—first in Guatemala, then again in the U.S.

I center a recent case where a young gay man, despite winning his case and being granted withholding of removal, was nevertheless unlawfully deported by ICE. His forced disappearance by the very system meant to protect him exposes the limits of legality and the haunting afterlives of

anti-immigrant federal policies. The courtroom win becomes a phantom victory, and the legal apparatus itself a stage for reenacting erasure.

Anthropological expert witness work thus emerges as a form of spectral labor—testimony not only to violence, but to absence, silence, and institutional betrayal. I argue that U.S. asylum policy, especially in the wake of Trump-era dismantling, operates as a technology of disappearance: rendering certain populations disposable, unseeable, or bureaucratically dead. These policies do more than deny refuge—they haunt the lives they abandon.

Presenter(s): Debra Rodman

Here to Stay? Disappearances, Erasures, and Silence in a Newcomer Epicenter

In 2024, Denver received over 42,000 newcomers. Its mayor recently testified to Congress and Trump made a bogeyman out of the city of Aurora. Despite more welcoming policies, Colorado is haunted by its past as one of the most restrictive states. In December of 2024, we shared the final report of collaboration with Denver's immigrant worker center. Of 101 intakes, 98% planned to stay in Colorado and 100% wanted to be center members. This winter, when the center called, over 77% had vanished: wrong numbers, disconnected phones, numbers belong to new people, restricted servers, immediate hang-ups, unanswered voicemails. This paper explores these disappearances as a technology of power across scales. This includes the national visibility of the ICE abduction of a well-known Colorado activist, as advocates have staved off disappearance through weekly detention center vigils. Nearby raids and legal violations were sanitized, but revealed by Colorado's rapid response teams. Instead of protecting them, universities advise precarious students to be invisible and remain silent as students are actively disappeared. Silences and disappearances embed into our classrooms, selves, and community work- how we show up, what collaboration looks like, and even through students who fail to show up to class for weeks. Yet it also points to sparks of re-visibility from vigils to community meetings, digital national digital national and local networks, and local political organizing.

Presenter(s): Rebecca Galemba

Haunted Memories: ICE Raids and the Guatemalan Genocide

On March 10, 2025, ICE agents raided a car wash in New Bedford, Massachusetts, arresting three Maya K'iche' men from Guatemala and sending them to a detention facility on Cape Cod. Within the next month ICE had made several additional raids locally, often at immigrants' homes in the early morning hours. Between January 20 and mid-April, nearly two dozen community members, principally Maya K'iche', have been taken into ICE custody, on at least two occasions through violent assault. This paper, based on nearly two decades of ethnographic witnessing and accompaniment with the local immigrant community, explores current immigration enforcement activity in the context of two historical traumas. The car wash raid took place almost exactly 18 years after ICE raided a garment factory in New Bedford on March 6, 2007, sending 361 people, mainly Central American immigrants, into detention. This heavily militarized action with helicopters, Coast Guard vessels, and over 500 law enforcement officers, left a deep wound in the

collective psyche of the immigrant community, and many survivors of that raid still reside in New Bedford. But the 2007 raid had called forth a second, deeper layer of historical trauma that still haunts the local Mayan community – the forced disappearances, massacres, and forced displacements that struck their communities of origin during the 36-year-long Guatemalan genocide, and that brought the first Guatemalan migrants to New Bedford in the early 1990s.

Presenter(s): Lisa Maya Knauer

Reviving Reverse Racism: Competing Perceptions of DEI and Discrimination in the Trump Era

As one of his first official acts as president in 2025, Donald Trump issued a series of Executive Orders (EOs) that vilified existing Diversity, Equity, and Inclusion (DEI) programs and preferencing, equating DEI with illegal and immoral discrimination. The framing of DEI as discriminatory is counterintuitive: DEI rose in the 1980s as an apolitical and business-driven alternative to expand and diversify workplaces, in part by creating individual and organizational changes that would expand access to opportunities, the inverse of illegal forms of discrimination.

This paper assesses competing perceptions of and claims around discrimination via popular social and legal trends. Although vague, inherent in Trump's 2025 EOs is an old and persistent ghost, the resurrection of the social, political, and legal logics of reverse discrimination, which leverage rights-based discourses around identity categories and equality to redirect resources and protections away from, instead of toward, historically marginalized communities. When paired with additional legal shifts around religious liberty in the 21st century, the logic of reverse racism has gained renewed social, political, and legal weight. Although currently in-flux, it is critical to understand how, when, and why specific discourses around DEI and discrimination are more and less successfully deployed to impact expansion and curtailment of rights and resource protections in the contemporary era.

Presenter(s): Melissa Maceyko

The Death that Engenders Ghosts: the anticipatory impact of Costa Rica's new role as a recipient of deportees from the U.S.

In February, Costa Rica's President Chaves announced that he had agreed to "collaborate with the United States in the repatriation of migrants". Soon after, 200 migrants from Central Asia and India arrived and were taken to recently-established Center for Temporary Migrant Care (CATEM), situated near the border with Panama. The full costs are covered by the United States, and the oversight of these persons falls on the International Organization for Migration. Among the migrants are Afghan women who fear returning to the Taliban-controlled country, and others who refuse to be repatriated. Despite its longstanding reputation as a country respectful of human rights and refuge, Costa Rica has not granted asylum to any of the migrants in CATEM. This situation has inflamed an already polarized population. This paper addresses the impact of federal policies on dismantling democracy abroad. To situate the problem, I first contextualize Costa Rica's cooperation with the current U.S. administration in a weakening of democratic institutions and proliferation of populist forms of governing. Then, using an anticipatory anthropology framework, I

describe the birth of new specters. Before a ghost exists, death occurs. Through the eyes of human rights activists, government employees and humanitarian workers, I question what has died in Costa Rica, what forms the new ghosts take, what are the foreseen impacts of these ghosts, and how they shape their new realities and everyday labor.

8361 Frontiers of Belonging

Start Date: 11/20/2025 4:15 PM **through** 11/20/2025 5:45 PM

Venue: Sheraton **Room:** Rhythms II (2nd fl)

Type: Oral Presentation Session

What happens to belonging when there is no formal and representative institution, like the state, to make claims to? What alternative forms of association take shape in its stead, specifically extending to land and property? And how are these negotiations over land depoliticized and smoothened through the law, capitalist extraction, and bureaucratic management? This panel examines land, borderlands, and frontiers in global colonial, settler colonial, and imperial contexts. By attending to specific processes in the Korean DMZ, Palestinian Jerusalem, Kurdish-Iraqi borderlands, Egypt's land dispossession, and México's southern border, panelists seek to understand what is lost, buried, and extracted in the aftermath of colonial construction and destruction. In doing so, we hope to generate a discussion that illuminates how forms of belonging emerge amidst the creation and fragmentation of territorial sovereignty.

Section: Association for Political and Legal Anthropology

Organizer: Thayer Hastings, American University, School of International Service

Chair: T. Yejoo Kim, University of California, Los Angeles

Presenter(s): T. Yejoo Kim, University of California, Los Angeles, Kerem Ussakli, Brandeis University, Reeham Mourad, Thayer Hastings, American University, School of International Service

Discussant: Kareem Rabie, University of Illinois, Chicago, Department of Anthropology

Presentation(s): Frontier Futures in the Korean DMZ

This paper will examine how capitalist development in the name of "peace" smoothenes over the realities of US settler military occupation and South Korean sub-imperial collaboration in the case of the Korean DMZ. Building upon years of fieldwork, the paper will focus on the region of Paju that is within and right outside the DMZ boundaries. From the frontier villages that were modeled after Israeli kibbutzim to the "new cities" being developed today, Paju has been host to various village and urban development projects that purport a specific kind of neoliberal security war front by the US and South Korean military. Specifically, the paper looks at how various local to state-led "peace" projects seek to rebrand and build over an unresolved imperial present as the US expands its military presence in the emerging cold war with China. From the former cold war era (the US and Soviet Union) to the current one, the paper will examine the historical connections between the

US's military and economic investments into creating war fronts doubling as peaceful "frontiers" from Palestine to Korea.

Presenter(s): T. Yejoo Kim

The Spiritual Pleasure of Serving the People': Producing Popular Belonging Along the Kurdish-Iraqi Borderlands

In this paper, I examine the role of strategic partnerships and networks between tribal men, oil & gas companies and villagers in the making of Garmiyan Region. Originally a part of Kirkuk, this region was gerrymandered into the Sulaymaniyah Governorate in 1975 as part of the Ba'ath Government's Arabization campaigns. Most of its population are dispossessed survivors of the Anfal Genocide who maintain that their tribal identity is a part of the multi-ethnic life in Kirkuk. Since the US invasion of 2003, private guesthouses reemerged from the lands of the Kurdish-Iraqi border. Traditionally serving as the agha's court, these guesthouses were thought to be in decline since the 1960s. Their resurgence as gated, lavish retreats with lush gardens is symbolic of the shifting social power of tribal notables in the region, from public authority to gated wealth. The men who own these guesthouses receive contracts for the everyday management of oil & gas companies in the region, while mediating between companies and villagers who are pushed out of their lands. Based on two years of fieldwork, I discuss how what these men call 'the spiritual pleasure of serving the people' generates privatized claims to sovereign belonging along the Kurdish-Iraqi borderlands. While recent anthropological literature has focused on how Kurds evade or are constricted by nation-states' borders to facilitate cross-mobility, I provide an instance where Kurds assert borders.

Presenter(s): Kerem Ussakli

The Afterlives of Dispossession: A family's labor in Postcolonial Egypt

"Land is the only refuge," my mother once said. This sentiment is often brought up by the women in my family alongside economic hardships. Central to my research is my grandfather, a tea trader whose parcel of land, a mango field he cultivated, was dispossessed by the state in El-Saf City in Upper Egypt in 1972 under the Expropriation for Public Good law. The law granted the state sole authority to transform private property into a "public good" without fair compensation. The ambiguous definition of "public good" creates opportunities for private interests to take precedence. Following Luxemburg's and Harvey's conceptualization of accumulation by dispossession, I argue that the law, backed with state force, has become a major site for: 1) capital accumulation, 2) devaluation of personal property, and 3) alienation and transformation of political subjectivities. In this paper, I trace how properties were situated, spanning different imperial and colonial modalities of legal pluralism. I then problematize land dispossession. I ask: how does the public good become 'dispossession by law', with the manifestation of dispossession across different scales and temporalities? How do colonial and national legal structures enable the commodification of land and expand capitalist relations in post-colonial 'socialist' Egypt? And

above all, what does it mean to be dispossessed? What labor of survival do the dispossessed undertake?

Presenter(s): Reeham Mourad

Landlords, Refuge and Unsettled Value in a Palestinian Borderland

Jerusalem borderland neighborhoods have become forms of refuge for noncitizen Palestinians. These territories are valued because of their frontier position on the edges of the Israeli-demarcated municipal lines and the physical separation wall. One form of bordering is reinforced by law and the other by concrete, although both are settler colonial techniques for managing surplus populations. This paper addresses the borderland neighborhood of Bir Ona on the West Bank side of the separation wall as a refuge for people whose identity cards under Israeli rule prevent them from living together in almost any other territory. Since 2003, the institution that governs the unification of personal status for married Palestinian couples separated by different legal statuses under Israeli law has been frozen. Within this extended deferral, Palestinians who could otherwise not live together do so, achieving so-called normal life, in and because of these borderland neighborhoods. Property valuation follows. By attending to the ambitions and concerns of a small-time landlord operating within this minute borderland, this paper seeks to understand how partial belonging translates into multivalent forms of value including property, the family, and claims of founding a neighborhood.

1883 Teaching Anthropology by Doing Anthropology: Pedagogy, the Ethnographer's Magic, and Learning Beyond the Classroom

Start Date: 11/20/2025 4:15 PM **through** 11/20/2025 5:45 PM

Venue: Sheraton **Room:** Rhythms III (2nd fl)

Type: Roundtable/Town Hall

Since the early twentieth century ethnographic fieldwork has been central to anthropological knowledge. It has also long been the realm of ghosts and spectres. As informed by forerunners like Bronislaw Malinowski, the "ethnographer's magic" (Malinowski 1922; Stocking 1992) is at its core experiential and intensely personal. The legacies and methodologies of early field ethnographers haunt us to this day. Students continue to receive limited advice and training in ethnographic methods. This style, as experienced by many of this roundtable's participants, is by design, informed by the belief that ethnography is something you learn how to do in the field. An individual's success or failure as a field ethnographer is ultimately tied to this rite of passage. This belief complicates the instruction of anthropological methods, especially for us who rarely received formal instruction ourselves.

This roundtable engages with this critical tension between pedagogy and experience at the core of ethnographic research and instruction, and how we as practicing cultural and linguistic

anthropologists teach such methods to college students in various "fields." Our discussion brings together anthropologists at different career stages to reflect on their experiences leading field schools and other experiential learning courses outside the classroom. As a group we have led programs both inside the U.S. (Alaska, Arizona) and abroad (Brazil, Costa Rica, Chile, Cuba, Fiji, Guatemala, Hungary, Malta, Nepal, South Africa, Zambia). The diversity of our programs, and what they emphasize, mirrors this range of locations. Our dialogue will pivot around a handful of concerns and topics, including but not limited to the following: the ethics of ethnographic fieldwork and its instruction (accounting for the experiential push and pull of ethnographic research; navigating larger structural inequalities); the challenges we have faced (practical and theoretical); how the changing nature of fieldwork informs how we teach anthropology in the field/abroad; and our experiences leading programs with varying emphases and locales. In engaging with this critical tension between formal pedagogical instruction and emergent skill that come through experience, we navigate the disciplinary spectres haunting our pedagogical efforts to create a more engaged and ethical future.

Section: Society for Cultural Anthropology

Organizer: Christopher Berk, Auburn University, Department of Sociology, Anthropology & Social Work

Presenter(s): Ellen Block, College of St. Benedict & St. John's University, Department of Sociology & Anthropology, Karen Brison, Union College, Department of Anthropology, Anton Daughters, Jennifer Guzman, SUNY, College At Geneseo, Department of Anthropology, Erika Hoffmann-Dilloway, Oberlin College and Conservatory, Department of Anthropology, Melanie Medeiros, SUNY, College At Geneseo, Department of Anthropology, Tim Wallace, North Carolina State University, Department of Sociology & Anthropology

Discussant: Christopher Berk, Auburn University, Department of Sociology, Anthropology & Social Work

8844 CAE Board Meeting

Start Date: 11/20/2025 4:30 PM **through** 11/20/2025 6:15 PM

Venue: Marriott **Room:** Napoleon (41st Fl)

Type: Special Event

Annual board meeting of the Council on Anthropology & Education. Agenda will include reports from president, treasurer, and chairs of standing and ad hoc committees. Open to all. We especially encourage individuals who may be interested in future CAE leadership to attend.

8560 Society for Humanistic Anthropology (SHA) Awards Ceremony and Open Mic (off-site at the Howlin' Wolf)

Start Date: 11/20/2025 5:30 PM **through** 11/20/2025 9:00 PM

Venue: Offsite

Type: Special Event

SHA Awards Ceremony 5:30- 6:30pm; Open Mic 7:00pm-9:00pm

The Howlin' Wolf, 907 S Peters St, New Orleans, LA 70130, United States.

Note: the venue is within a 15-minute walk from the AAA conference site

This off-site, evening event brings together anthropologists, artists, musicians, and community members for a live performance showcase that celebrates the intersections of ethnography and creative practice. Hosted at the iconic Howlin' Wolf Music Club, the salon features an open mic and a featured artist set.

Organized by the Society for Humanistic Anthropology (SHA) and the Music and Sound Interest Group (MSIG), the event highlights the creative practices of AAA scholar-artists ("scholartists") working across sound, story, and performance.

The evening includes:

- Ethnographic Salon (7:00 PM onward): Short performances by AAA members, including songs, poetry, soundscapes, storytelling, and hybrid works rooted in field research and humanistic inquiry.
- Featured Artist Set: A live performance by New Orleans-based singer-songwriter Dusky Waters, whose work blends blues, folk, and Southern oral traditions.

Call for Participants:

We welcome performances from anthropologists and affiliated artists working at the intersection of research and creativity. To register to perform, please email: kristinajacobsen@gmail.com

8548 Opening Keynote with Jason De Leon, with Awards Recognition

Start Date: 11/20/2025 6:00 PM **through** 11/20/2025 8:00 PM

Venue: Sheraton **Room:** Grand Ballroom A-C (5th fl)

Type: Special Event

Jason De León is Lloyd E. Cotsen Endowed Chair of Archaeology, Professor of Anthropology and Chicana, Chicano, and Central American Studies, and Director of the Cotsen Institute of Archaeology at the University of California, Los Angeles. He is also Executive Director of the Undocumented Migration Project, a non-profit research, arts, and education collective that seeks to raise awareness about migration issues globally. He is a 2017 MacArthur Foundation Fellow and author of the award-winning book "The Land of Open Graves: Living and Dying on the Migrant Trail." De Leon's latest book "Soldiers and Kings: Survival and Hope in the World of Human Smuggling" won the 2024 National Book Award for Nonfiction.

8553 Society for Anthropological Sciences: Business Meeting

Start Date: 11/20/2025 7:00 PM **through** 11/20/2025 8:30 PM

Venue: Marriott **Room:** Balcony L

Type: Special Event

Join us for the Annual Business Meeting for the Society for Anthropological Sciences. The meeting is open to all current members as well as those interested in the society. We discuss the previous year's business, plan for next year, and present awards.

8750 SEAA business meeting

Start Date: 11/20/2025 7:00 PM **through** 11/20/2025 8:00 PM

Venue: Marriott **Room:** Galerie 3

Type: Special Event

Business meeting of SEAA members reviewing year's activities, budget, awards. Further discussion of future events

8854 Joint Section Reception @ Spectral Remix- offsite

Start Date: 11/20/2025 7:00 PM **through** 11/20/2025 9:00 PM

Venue: Offsite

Type: Special Event

Please join us for a joint section reception hosted by the Society for Cultural Anthropology, the Society for Visual Anthropology, and the American Ethnological Society. The reception will be held from 7-9pm on Thursday, November 20th at Merchant Hall, a fifteen-minute walk from the conference center. The venue is the site of Spectral Remix, an off-site AAA exhibition featuring collaborative multimedia ethnographic work by over forty participants. Come and mingle, take in the exhibition, and sample the appetizers and cash bar that will be available. Hope to see you there!

Organizer: Craig Campbell

8821 Business Meeting (Middle East Section)

Start Date: 11/20/2025 7:00 PM **through** 11/20/2025 9:00 PM

Venue: Sheraton **Room:** Maurepas (3rd fl)

Type: Special Event

Business Meeting, Middle East Section

8737 Society for the Anthropology of Consciousness - Business Meeting

Start Date: 11/20/2025 7:00 PM **through** 11/20/2025 8:00 PM

Venue: Sheraton **Room:** Southdown (4th fl)

Type: Special Event

Business Meeting

8654 Music as a Centerpiece of Culture and Society

Start Date: 11/20/2025 7:30 PM **through** 11/20/2025 9:00 PM

Venue: Marriott **Room:** Lafayette (41st Fl)

Type: Special Event

Earlier this year, ASA sponsored a presentation by Tony Seeger titled "Changing People's Lives through Music." That led to an enthusiastic and extended conversation about music and how it helped mold many ASA members into the anthropologists that they eventually became. As a follow-up, we decided to hold an early-evening event to continue the conversation, combined with in-person musical performances. We invite ASA members who are also musicians to bring instruments and share some of the songs that inspired them to pursue their chosen career paths. Our plan is to hold the event in the conference hotel on Thursday, from 5 to 7 PM, after which participants will go to dinner on their own and be encouraged to find local musicians for their entertainment.

8706 C&A and SAFN Graduate Student and Postdoc Social Mixer-Backspace Bar and Kitchen

Start Date: 11/20/2025 7:30 PM **through** 11/20/2025 9:30 PM

Venue: Offsite

Type: Special Event

Join us in the evening on Thursday, November 20th for the yearly social mixer for graduate students and postdocs sponsored by Culture & Agriculture and the Society for the Anthropology of Food and Nutrition at Backspace Bar and Kitchen, 139 Chartres St, New Orleans, LA 70130.

8856 NAPA Business Meeting

Start Date: 11/20/2025 7:30 PM **through** 11/20/2025 9:00 PM

Venue: Sheraton **Room:** Napoleon BR C3 (3rd fl)

Type: Special Event

National Association for the Practice of Anthropology Annual Business Meeting and Awards Ceremony.

8751 Reception for SEAA members immediately following SEAA business meeting

Start Date: 11/20/2025 8:00 PM **through** 11/20/2025 10:00 PM

Venue: Marriott **Room:** Galerie 3

Type: Special Event

SEAA reception immediately following business meeting, for SEAA members and guests.

9085 Princeton University Anthropology Gathering

Start Date: 11/20/2025 8:00 PM **through** 11/20/2025 10:00 PM

Venue: Sheraton **Room:** Napoleon BR C2 (3rd fl)

Type: Special Event

Gathering for fellowship with Princeton University affiliates. We will have drinks and appetizers.

8615 Critical Urban Anthropology Association -- Board Meeting

Start Date: 11/20/2025 8:00 PM **through** 11/20/2025 9:10 PM

Venue: Sheraton **Room:** Rex (8th fl)(Access vis elevator only)

Type: Special Event

Meeting of the Board of Critical Urban Anthropology Association (CUAA)

8764 Society for Linguistic Anthropology (SLA) Business Meeting and Awards Ceremony

Start Date: 11/20/2025 8:15 PM **through** 11/20/2025 10:15 PM

Venue: Sheraton **Room:** Grand Ballroom D (5th fl)

Type: Special Event

The annual business meeting and awards ceremony for the Society for Linguistic Anthropology.

9084 Brown University Anthropology reception at the AAA conference for faculty, alumni, and students of Brown University attending the AAA conference.

Start Date: 11/20/2025 8:30 PM **through** 11/20/2025 10:00 PM

Venue: Marriott **Room:** Galerie 5

Type: Special Event

Brown University Anthropology reception for faculty, alumni, students, and friends of Brown Anthropology.

8767 Society for Linguistic Anthropology (SLA) Reception

Start Date: 11/20/2025 10:20 PM **through** 11/20/2025 11:20 PM

Venue: Sheraton **Room:** Grand Ballroom D (5th fl)

Type: Special Event

SLA reception following the Annual Business Meeting and Awards Ceremony.

Friday, November 21, 2025

8766 Society for Linguistic Anthropology (SLA) Extended Board Meeting

Start Date: 11/21/2025 8:00 AM **through** 11/21/2025 9:00 AM

Venue: Marriott **Room:** Beuregard

Type: Special Event

SLA extended board meeting.

8606 Council for Museum Anthropology Business Meeting

Start Date: 11/21/2025 8:00 AM **through** 11/21/2025 10:00 AM

Venue: Marriott **Room:** MGB - Salon A

Type: Special Event

Anyone interested in the Council for Museum Anthropology section is invited to attend our annual Business Meeting. We will review section reports and election results, as well as discuss initiatives and concerns related to the section and its journal, Museum Anthropology (including strategic planning). We invite attendee input.

8569 NAPA/AAA Careers Expo - Career Guides Brunch

Start Date: 11/21/2025 8:00 AM **through** 11/21/2025 11:45 AM

Venue: Marriott **Room:** Riverview 1 (41st Fl)

Type: Special Event

Brunch for Careers Expo Career Guides that will include an overview of the event and any needed training.

8671 Society for Medical Anthropology, Section Interest Groups Breakfast

Start Date: 11/21/2025 8:00 AM **through** 11/21/2025 9:30 AM

Venue: Marriott **Room:** St. Charles (41st Fl)

Type: Special Event

The Society for Medical Anthropology supports several committees and caucuses that address the unique interests and needs of our membership. This breakfast brings together the chairs of all of the SMA SIGs.

8646 New Section President Orientation

Start Date: 11/21/2025 8:00 AM **through** 11/21/2025 9:00 AM

Venue: Sheraton **Room:** Armstrong BR (8th fl) (access via elevator only)

Type: Special Event

New Section President Orientation for incoming presidents with terms starting November 2025.

8836 Society for Visual Anthropology Film & Media Festival-- Day 3

Start Date: 11/21/2025 8:00 AM **through** 11/21/2025 9:00 PM

Venue: Sheraton **Room:** Bayside A (4th fl)

Type: Special Event

The Society for Visual Anthropology screens the best of ethnographic film at the annual SVA Film & Media Festival. The Festival is held as part of the American Anthropological Association (AAA) Annual Meeting, giving filmmakers and distributors broad access to an audience of thousands of anthropologists, educators, and other attendees.

Ethnographic film and media can be defined broadly as works that emerge through ethnographic fieldwork or that use, are informed by, illustrate, or evoke concepts and principles of anthropological theory, methods, or practice.

2025 SVA Film & Media Festival Directors:

Dr. Anna Neumann

Dr. Mariam Abazeri

8849 Students of Color / LGBTQ Mentoring Session

Start Date: 11/21/2025 8:00 AM **through** 11/21/2025 9:45 AM

Venue: Sheraton **Room:** Evergreen (4th fl)

Type: Special Event

Organized by the CAE Graduate Student Representative, this mentoring event will be of interest to students of color and LGBTQ students in the academy. We will discuss the challenges, past experiences, successes, and struggles as emerging minoritized scholars. The aim is to provide spaces of ongoing support for thriving in academia and life.

8726 Ghosts of Environmental Futures: Environmental Changes and Community Voices on the Placencia Peninsula, Belize

Start Date: 11/21/2025 8:30 AM **through** 11/21/2025 5:00 PM

Venue: Sheraton

Type: Installations

This installation presents an immersive, multisensory installation that transports conference attendees into the ecological and social realities of the Placencia Peninsula, a coastal community in southern Belize. The installation directly engages with the AAA 2025 theme of "Ghosts" by making tangible the haunting presences of environmental and cultural loss from vanished coral reefs and disappearing mangroves to the erasure of coastlines and the displacement of communities.

The project is based on the research of Dr. Kris-An Hinds in partnership with USF Strong Coasts Belize Community Fellows Monique Vernon, Natasha Gibson, and Delcia McDougall. As a researchers embedded within the Placencia Peninsula community, their methodology is built on

long-term engagement and collaborative knowledge production. This installation is a direct output of that approach, translating four years of interdisciplinary research into a public-facing, sensory experience. The work is further enriched by the contributions of a collaborative team of Strong Coasts Belize Community Fellows, early-career anthropologists, environmental engineers, marine scientists, and community restoration practitioners from the Strong Coasts network.

Drawing on this rich, co-produced knowledge, the exhibit merges technology with ethnographic storytelling. It is designed as a triptych of experiences:

1. A Virtual Reality Experience offers a 360-degree immersion captures the story of coral reef ecosystems surrounding in Placencia Peninsula and the cultural significance of the environment's transformation over the past years. This video is both a ghost and survival story that brings forth the life and voices to the disappearance of the coral reef and the voices of the people, organizations, communities working to revive and protect them.
2. A Walking Art Gallery features photo vignettes from Belizean environmental champions, documenting remembered changes.
3. Tactile 3D-Printed Models of coral reefs that provide a physical form to abstract biodiversity loss, serving as visual and tactile metaphors for ecological "ghosts" and the power of restoration.

This installation does not merely document loss. It creates a space to witness and engage with the vibrant community responses to these crises, highlighting local visions, cultural heritage, and the ongoing work of ecological and cultural safeguarding. It is a story of both ghosts and guardians, inviting reflection on memory, loss, and the transformative power of community-driven action.

Organizer(s): Kris-An Hinds, University of South Florida, Department of Anthropology, Sherilyne Jones, Rebecca Zarger, Maya Trotz, Monique Vernon, University of South Florida, Strong Coasts Community Fellow

306 Society for Linguistic Anthro Flash Session #1

Start Date: 11/21/2025 8:30 AM **through** 11/21/2025 10:00 AM

Venue: Marriott **Room:** Balcony I

Type: Flash Presentation

Organizer: Maia Rosenberg, University of Pittsburgh, Dariush Izadi, Western Sydney University, Catherine Evans Davies, University of Alabama, Stefania Becerra Lavado, Matilda Vokes, Yinan Zhang, Harvard University, Kendall Medford

Presentation(s): "We could call them the Troika": Phatic labor and the ratified decision

This paper examines a virtual (Zoom) meeting of a group of organizers in the New York City chapter of the Democratic Socialists of America (DSA), analyzing their use of phatic labor (Elyachar, 2010) within the context of a meeting to show that phatic labor is essential in building social ties between interactants, and these ties are what enable the group to achieve what I call a ratified decision, or a decision legitimized and accepted by the group as actionable. I show that it is the democratic socialist values consciously shared by group members that create a touchstone for the interactional norms necessary to achieve a ratified decision. It is these same values that allow for the both the phatic communion and phatic contact that create the structure of legitimation on which the ratified decision is built. A discourse analysis of this meeting shows that small talk produces ties between group members and enables them to transmit social value along communicative channels. This scaffolds certain legitimation tactics (Morton, 2014) that move the group towards a ratified decision. Legitimation tactics are defined as manoeuvres of speech undertaken by participants to legitimize a decision. In other words, we can understand legitimation as the process to achieve the goal of a ratified decision. Under the premise that phatic labor is an umbrella term encompassing phatic contact and phatic communion, I suggest that each of these operate within the context of two layered realms that occur during a meeting: that of the community of practice, and that of the meeting itself.

Discourse, Materiality, and Agency: Haunting Traces in Everyday Social Interactions

Markets and shops are more than spaces of exchange; they carry the ghostly traces of the past. Faded price tags, the absent voice of a shopkeeper, or products no longer stocked-these are spectral remnants of past interactions that continue to shape present dynamics. In specific contexts, such as Persian ethnic shops in Sydney, these hauntings take on particular forms: the echoes of economic shifts, migration stories, and linguistic transformations. These material traces-objects, spaces, and practices-are not merely functional; they bear the weight of histories that refuse to be fully erased. The interplay of materiality and discourse in these spaces creates a complex layering of past and present, where traces of history are both tangible and intangible, shaping the present moment in ways that often go unnoticed.

This paper explores how the spectral dimensions of materiality and discourse (Cavanaugh & Shankar, 2017) manifest in the context of Persian ethnic shops in Sydney. Drawing on ethnographic methods, it examines how everyday objects, such as vegetables, shop signs, and store layouts, become active agents in shaping social interactions and mediating cultural meanings. These objects, such as the fading price tags or the layout of a shop, carry traces of historical, economic, and migration forces that shape contemporary interactions. Using actor-network theory (Latour, 1996, 1997, 2005) and the concept of mediational means/tools (Scollon, 2001), I analyze how these material elements are not neutral but are imbued with power and memory, forming connections between past and present. Through this lens, the paper demonstrates how the mundane objects in these spaces-vegetables, for instance-become spectral markers of migration, colonial legacies,

and shifting social relations, showing how history lingers in the everyday through material and discursive practices.

In addition, this paper responds to Deumert's (2021) call to move beyond naïve empiricism by recognizing the affective and spectral dimensions of social life. The agency of discourse in these spaces is not solely the result of immediate interactions but is shaped by residual, ephemeral, and haunting forces-echoes of colonial legacies, economic shifts, and migration histories. These forces infuse everyday practices with deeper layers of meaning, where material objects and discursive practices are not just functional but carry social, historical, and affective weight. Through this lens, the paper demonstrates how sociolinguistics and linguistic anthropology can engage with the spectral traces of history, revealing how everyday commercial spaces are not only economic sites but also sites of memory, struggle, and transformation.

Presenter(s): Dariush Izadi

Ghosts as Part of the Family

The presentation will examine a documentary, entitled "The Ghosts of Selma," produced in 1998 by the University of Alabama Center for Public Television for broadcast on Alabama Public Television. The discourse analysis, of the 6 videotaped accounts by local residents of ghosts that shared their homes, is informed by commentary provided by the producer of the documentary, Max Shores.

Work on ghost stories by folklorists has had typically three characteristics: it has used written sources, it has represented mostly hearsay evidence based on the experiences of others, and the stories themselves have tended to produce fear or anxiety about the unknown associated with death. Many written sources were created in the past before audio/video technology, and many modern sources are simply written versions of an oral account. These data are quite different in that they are mostly first-hand oral accounts of experience with ghosts, enhanced by visuals created by the producer of the documentary.

These ghost stories appear to be unusual in the modern world in that the ghosts seem to be treated as "part of the family." Apparently this orientation was more typical in the pre-scientific context in which ghosts were treated as part of the "community of persons"; Bowyer (1980) discusses the medieval Christian situation and its continuation beyond the Reformation in some parts of Europe, and Nyce (2014) examines the same situation in the world of the late 19th century Pennsylvania Dutch. In this particular situation in Alabama, the orientation to ghosts as part of the family was established by the well-known storyteller from Selma, Kathryn Tucker Windham (1918-2011). Children who read her series of 7 books, first appearing in 1969, were familiar with the ghost named Jeffrey who lived in her house. She was clearly unafraid of him and talked about the advantage of having a ghost in the house because you can blame things on him. The producer of the documentary was familiar with her work and in fact went to her first when he was in the planning stage. Her influence may well have shaped the attitudes of the tellers of these ghost stories.

Presenter(s): Catherine Evans Davies

Haunted Voices: Raciolinguistic Ghosts and Quechua Resistance in Lima, Peru

This project examines how colonial legacies continue to structure linguistic and racial hierarchies in contemporary Peru, focusing on Quechua speakers in Lima. While Quechua is Peru's most widely spoken Indigenous language and is recognized as an official language, Quechua speakers in the capital city face widespread linguistic discrimination. These sociolinguistic hierarchies are present in schools, hospitals, markets, and legal institutions-where Spanish dominance shapes access and belonging.

Based primarily on preliminary ethnographic fieldwork conducted in Lima from May to August 2025, this project presents how Quechua speakers navigate and contest these sociolinguistic hierarchies. I draw on raciolinguistic theories (Rosa and Flores 2017) and the concept of linguistic imperialism (Phillipson 1992) to explore how the racialization of Quechua intersects with broader class-based and colonial ideologies of modernity. In Lima, modern citizenship is often imagined through Spanish, rendering Quechua and its speakers backward or ghosted (Huayhua 2015).

Through interviews and participant observation in everyday settings-such as community markets and hospitals-I document how participants experience linguistic exclusion while articulating resistance and memory. I show how language becomes both a site of oppression and of political presence. Participants' stories reveal not only the endurance of colonial structures but also how Quechua speakers mobilize linguistic agency to challenge erasure and reclaim public space.

This research contributes to anthropological conversations on language, race, and urban inequality in Latin America, while addressing broader questions of language justice in multilingual societies. Ultimately, my project seeks to advance discussions on language justice and promote equity and recognition for Quechua communities in Peru.

Presenter(s): Stefania Becerra Lavado

Reshaping Social Distancing: How does Competitive Signage Affect Meaning in the Linguistic Landscape of Covid-19?

Landscapes come from "how we view or interpret space" (Jaworski and Thurlow 2010:3), including the perception of signage like posters or graffiti. Signs have an informative purpose, and their symbolic meaning also influences the landscape (Leeman and Modan 2010, Lou 2007). But how is the landscape shaped if these meanings are contested? This study explores the phenomenon of competitive signage, or signage that intentionally challenges other signs in its surroundings.

Using signage related to the Covid Pandemic in East London, I discuss how competitive signage creates and shifts symbolic meaning in the landscape. Competitive signage occurs when signs found together have contrary positions. Typically, at least one sign changes or obscures the information of others in its vicinity. The perception of these signs is then intertwined with the signs' individual meanings.

Over a year, I documented Covid-related signage across the London Borough of Tower Hamlets and surrounding neighbourhoods. Competitive signage about Covid was frequent. Therefore, I created a

sub-corpus of 220 signs that a) explicitly address Covid; and b) show evidence of competitive signage: overlaying, ripping, crossing out or adding to the original sign.

Applying Goffman's (1986) concepts of layering and footing reveals how competitive signage can change symbolic meaning. On an informative level, different signs can position themselves differently within a frame. On a symbolic level, this positioning could become an additional frame layer as information that was presented as integral is now contested: indicating a shift in their symbolic meaning.

Three key trends emerge from the competitive signage data: defacing social distancing signage with contradictory signs, obscuring anti-lockdown signage, and cooccurrence of these two phenomena in one location. I find implicit information, such as presenting social distancing advice as integral, is troubled by the addition of anti-lockdown signage. The challenge inherent to some anti-lockdown signs is curtailed by the damage to these signs, which in turn implies support for public health messaging. These examples indicate fierce discourses at work on public health and misinformation. I argue the act of layering in itself creates symbolic meaning: the ghost of a torn down sign is then a symbol of resistance or illegitimacy in an emerging pandemic landscape.

Speaking into the Air: Semiotics of Euphemism and Avoidance Registers in China's Anti-Zero-COVID Discourse

This paper discusses the social semiotics of euphemism as avoidance registers in China's Anti-Zero-COVID discourse in 2022. I examine two cases in which explicit denotation gets suppressed and the non-denotational quality becomes salient: the "Red-Blue Design Competition" at Tongji University, Shanghai, where a student's blunt complaint against the administrative authority is recoded and improvised into various forms with the color combination of red and blue; the A4 White Paper Revolution, where the protestors wear masks and hold a piece of blank paper during their assembly. While the former "red-blue" is an online, decentralized, and improvisational reproduction of memes, the latter is performed within constraints of the register and genre of protesting through a collective anonymous "blankness." Both cases are radical avoidance registers

deeply indexed in the physical lockdown, psychological fear, and a metapragmatic awareness of censorship. When words are censored and therefore euphemized, denotation vapors. Yet, the color, the blankness, and the indexical air begin to gain salience. The Peircean firstness takes the place of thirdness and comes back as a stronger phantom, upon which a metapragmatic discourse emerges against the censorship. These cases ask the same question: where else can communication reside when "language" is no longer available? This paper thus proposes reconsidering the inclination of looking for denotational forms in linguistic anthropological analysis. It also invites our attention to communication at the edge of language, even at the edge of our visible world, for what is not spoken always comes back like a ghost.

Presenter(s): Yinan Zhang

The language of Haiti's past, alive in today's Cuba: A case study of the immigrant time capsule effect on language revitalization efforts

Haitian Creole (Kreyòl), the national language of Haiti, was first brought to neighboring Cuba after the Haitian Revolution of 1804. Throughout the early 19th century, several large, subsequent migrations of Haitian sugarcane laborers maintained the language for generations. It is often considered the second most widely-spoken language in Cuba, after Spanish. However, the dire economic situation of today's Cuba means that the once-steady flow of Haitian migrants into the country has stopped, and with it, the maintenance of Kreyòl in younger generations.

This paper explores contemporary grassroots efforts to preserve and promote the Kreyòl language amidst this relatively recent and abrupt demographic shift. Building on the concepts of the immigrant time capsule effect (Lung 2024) and Levitt and Glick Schiller's (2004) approach to transnational migration, I demonstrate how the linguistic features and sociocultural status of Kreyòl as used by 19th and 20th century Haitian migrants have had a lasting effect on the variety of the language found in Cuba today. Based on ethnographic interviews conducted in Havana in 2024, I show that many linguistic features of the variety are "outdated" and reflect the language of 19th and 20th century Haiti. I also argue that the lack of literacy in the original migrant generations has directly hampered contemporary efforts to revitalize and promote the language. Community organizers who are struggling to teach and promote the language on a large-scale often cite literacy challenges as their primary roadblock. The sociolinguistic reality of the past, in this way, lingers in the present reality of speakers and community organizers, as a reminder of the migrants who came before.

Presentation(s): Empowering Domestic Workers in the age of AI: A digital Anthropologist's fight for privacy, Immigration Rights, justice and Visibility

This paper explores how digital anthropology, combined with community-engaged practices, is being applied to support and uplift the domestic workers movement-particularly through the lens of immigrant and women-led labor organizing including myself. Drawing from my work with Women Working Together, a grassroots nonprofit supporting domestic workers & Immigration rights, I demonstrate how digital ethnography, participatory research, and critical engagement with technology can foster collective empowerment, visibility, and resistance.

This presentation centers on three key areas: (1) how participatory digital ethnography captures the lived experiences of domestic workers often excluded from dominant labor narratives; (2) how digital tools, including storytelling platforms, mobile research methods, and community-led training, have been co-developed to increase digital agency and leadership; and (3) how emerging technologies, particularly artificial intelligence, present both opportunities and threats to this labor force.

As algorithmic management, surveillance technologies, and biometric data systems increasingly shape the conditions of informal labor, this paper critically examines the implications of AI on privacy, autonomy, and exploitation within domestic work. It considers how digital anthropology can help communities navigate, resist, and reshape these systems by producing culturally grounded, ethically informed knowledge and action.

This work contributes to broader conversations about the role of anthropologists in technology ethics, labor justice, and public-facing research.

Presenter(s): Scarleth Herrera

Knowledge Organisation as Governance: Lessons in Adaptive Infrastructure Design

As digital technologies increasingly mediate social interaction, they are fundamentally reshaping how information is produced, shared, and controlled. As datafication accelerates the proliferation of information, knowledge organization emerges as a critical site of governance and resistance. While critical media studies have typically emphasized the centralizing tendencies of digital platforms -- often characterized by hierarchical, top-down structures described as implicit feudalism (Schneider 2022) -- this study explores alternative possibilities by investigating how digital tools and infrastructures might instead be designed to distribute decision-making authority.

However, decentralised and permissionless organizations that lack defined boundaries, clear leadership, or cohesive vision risk succumbing to what Freeman (1972) termed a tyranny of structurelessness, where ambiguity undermines collaboration and threatens sustainable governance. Through ethnographic methods, this research examines how Metagov -- an online laboratory for digital self-governance -- navigates these tensions through the implementation of a Knowledge Organisation Infrastructure (KOI). KOI is an experimental sociotechnical system designed to empower communities with greater collective control over how their knowledge is curated, managed, and shared, fostering localized forms of resistance to centralized control and institutional vulnerability.

Preliminary findings suggest that while KOI aims to improve the accessibility and discoverability of localized knowledge, it also resurfaces longstanding governance dilemmas, such as aligning values, structuring decisions, and facilitating participatory practices. Although KOI does not resolve these issues, it offers a critical testing ground for innovative approaches to knowledge organization, coordination, and sustainability within decentralised networks. In this way, KOI seeks to challenge dominant platform logics by supporting local groups in maintaining autonomy and interconnectedness, thus addressing vulnerabilities inherent to digital infrastructures and promoting resilient, sustainable modes of collective knowledge governance.

Photographing the Goddess: Media, Mediation and the Medium

This paper explores the shifting relationship between ritual possession specialists (velichappatus) and photography in Kerala, with a focus on those who embody the Goddess Kodungallur Bhagavathy. Traditionally, oracles were deeply wary of being photographed during possession. As my interlocutor Kamala explained, "Many years ago, no oracle would allow you to take their picture when the Goddess had descended. Why? Because once you have a photo of the Goddess, what good is the oracle's body? The oracle would die after." The fear was that capturing the Goddess in an image would displace her presence in the oracle's body-and even hasten the oracle's death.

Today, however, velichappatus perform before a sea of cameras and smartphones. Social media pages come alive during the annual Kodungallur temple festival, dedicated solely to photographing oracles as they dance the Goddess. Promotional materials from state and private tourism ventures routinely feature images of oracles in trance. Some oracles even hire professional photographers and videographers to document their moments of possession-sometimes archiving these images in private collections, sometimes distributing them widely.

Based on long-term ethnographic fieldwork, this paper examines how velichappatus' relationship to the camera has transformed: from anxious resistance to active collaboration. What does it mean when the camera, once viewed as a threat, is now welcomed into the sacred ritual space? How did the camera move from being merely a witness to another participant in the ritual activity? What theological, ethical, and aesthetic negotiations enable and are enabled by this shift? I argue that this transformation is not merely technological but ontological: it reflects a changing theory of presence, mediumship, and divine embodiment. As images circulate across platforms and publics, I ask what is at stake for the oracles-not just in terms of visibility, but in how they understand the Goddess's presence, their own ritual labor, and the role of media in sustaining divine encounter.

Social struggles and identity constructions in Guadeloupe, ex-french colony

For those who passed by the windows of primary schools in Guadeloupe, hearing "our ancestors, the Gauls..." recited in the 70s by schoolchildren could seem normal. However, despite a political strategy of mind-shaping by the French government, ranging from the absence of references to Africa in school textbooks, massive emigration programs for the overseas french regions populations to mainland France such as BUMIDOM (migration office of the Overseas Territories) to the exercise of popular repression (armed shooting of May 68), Guadeloupeans never gave up fighting for better social living conditions to a certain form of political autonomy.

The May 68 shooting triggered by the French army in a context of wage demands, remain an essential social marker for understanding the struggles of recent decades and particularly the social mobilization of 2009 known as LKP (lyannaj kont pwofitasyon) which paralyzed Guadeloupe for 2 months.

In my dissertation work, I start from the social fact of 2009 which will be used as an analyzer in Guadeloupean society because it is an identifiable social fact in time and space (geolocatable) which makes it possible to recognize actors, behaviors, a set of dynamics and a whole symbolic dimension which will be approached from the angle of semiology, in a logic of meaning.

Indeed, the leaders of the LKP (Lyannaj Kont Pwofitasyon), claimed in many respects to be the heirs of May 68 which marked an imprescriptible turning point in the emergence of an identity demand distinct from that of metropolitan France. And if Eli Domota, leader of LKP 2009 explains that it is not a white/negro conflict, he recognizes that Guadeloupean society evolves into class and race relationship. Very few strikes stand out from the socio-racial conflict says sociologist Patricia Braflan-Trobo, which according to her opens a new field of expression where history and culture are constantly manipulated consciously or unconsciously for the conflicting fact revolves around a main axis: the racialization of social relations". .. [this notion of "racialization" of social relations that Michel Wieworka defines as a process by which a society represents itself..., as made up of social groups of races, in competition and in opposition..."] (Braflan-Trobo 2007).

This communication focuses on the memory of slavery in the indigenous and autonomist discourses held by the LKP members, using different strategies for constructing a social body. To

establish our analytical framework we will refer to Balandier's "Political Anthropology" where the colonial situation results in a generative socio-anthropology since... "The new world order is prefigured in a return of politics which accompanies the changes and mutations which are continually taking place. This movement leads to a progressive anthropological appropriation of the political field, ... in the forms of explicit tradition and those revealed under the test of the present..." (Balandier 2006).

Urban Design as Diagnosis:

Rethinking Mental Health through the Anthropology of Infrastructure in Anchorage, Alaska

This paper contributes to the emerging anthropology of the built environment by examining how infrastructures in Arctic urban centers are enmeshed with ecologies, care practices, and affective life. Focusing on Anchorage, Alaska, it considers how urban design and redevelopment processes shape residents' experiences of mental well-being, not simply as outcomes of environmental conditions but as emergent from lived, spatialized practices. Drawing on Actor-Network Theory, proxemics, and spatial ethnography, the study traces how environmental stressors-such as noise, air pollution, and the ambient threat of crime-interact with social networks, everyday spatial routines, and dominant representations of space to produce, complicate, or ease mental distress. Rather than approaching infrastructure as a fixed or solely material domain, this paper conceptualizes it as relational bundles-contested, performed, and co-constructed through ongoing negotiations of space, meaning, and affect.

Through an ethnographic account of redevelopment in Anchorage's city center, the study explores how transformations in the built environment are linked to shifting perceptions of mental health, evolving neighborly relations, and fluctuating senses of agency and empowerment. Particular attention is given to the role of urban planning and design under the pressures of climatic extremes, resource limitation, and oscillating states of depopulation-conditions that complicate standardized models of care and challenge assumptions about livability in northern cities. By foregrounding the lived experience of urban residents through space and temporality in the circumpolar North, this research reframes mental health not as a static diagnostic category but as an emergent quality of dynamic infrastructural, ecological, and social entanglements. Ultimately, it calls for planning practices attuned to the affective textures of place-ones that move beyond safety and efficiency toward the intentional cultivation of urban atmospheres and the co-production of collective well-being.

What Can One Do with an Anthropology Degree? Addressing this Ghost of a Question in 2025

How do we as anthropologists, with varied roles and responsibilities in public and private organizations, bring stakeholders together to sustain and transform our discipline in present and future generations? This paper presents how anthropology programs and initiatives may respond to

recent threats to their existence, including decreased funding, declining enrollments in academic programs and in higher education in general, relatively low salaries compared to those found in other careers, and political attacks on the social sciences and related professions. Overall, this paper explores how anthropologists might currently address a familiar ghost in the question, "What can one do with an anthropology degree?"

Presenter(s): Helen Blouet

When the Children Are Gone: Re-making Segregationist Futures in Sacramento, California

Histories of segregation and racial exclusion haunt California's capital city, Sacramento. In the city's revitalization project, what many residents call gentrification, the historically Black and Latinx neighborhood of Oak Park is being reconfigured. Since the revitalization project began 20 years ago, 37% of the entire Black community has been displaced. Latinx people remain among the most impoverished. White residents, however, see a return to what they call "the golden age." Through establishing new historical districts, preservation projects, and creating architectures which resemble the "lost history" of the neighborhood, segregationist pasts are mobilized to imagine the future. Simultaneously, Black and Brown business owners claim the same sites as placemaking projects for their communities while BIPOC activists refute the business owner's claims. In this presentation, I attend to the granular experiences of everyday community members to discuss these processes of racialization and place-making. I argue that materializations of memory carry affective power, connoting entanglements with temporal registers that align with specific forms of racialized experience. Through an analysis of art, children's parks, and life stories, this presentation works to show how material manifestation of certain expressions of the future are made through the dispossession of Othered futures.

Presentation(s): A` La Maison or F'l Dar: Moroccan Jewish Celebrations and Observances in the Domestic Sphere

This article examines Moroccan Jewish commensal events such as shabbat observance and holiday celebrations that have taken place in Fes. My experiences of celebrations "à la maison" or

"f'l dar"(at home) have occurred in the home of my close companion and interlocutor Madame Camille al-Fassi Martin (pseudonym). The Majority of our Shabbat observances were very intimate, with only Camille, our friend Esmerelda Toledano (pseudonym), and I in attendance, although, there were on several occasions surprise impromptu guests, family visiting from abroad, and even Jewish out of towners needing a host for Friday night dinner. What I describe in this article reflects my observations and my participation in Shabbat and holiday commensal encounters with two Fassi Jewish ladies, Camille and Esmerelda, and encounters with some of their acquaintances, friends, and family members in Camille's home in Fes, Morocco.

This article interrogates ways in which foodways and commensal practice, or the act of eating and drinking together at the same table, as part of the process of "making home" might shed light on Moroccan Jewish subject formation and belonging. The overarching question which I seek to answer, through a foodways lens, is "How do Jews living in Morocco construct primary identities as Moroccan and as Jewish while "making home" as an ethnocultural minority living among an Arab Muslim majority with little conflict?" I argue that Jewish and Moroccan cooking, and the idea of Moroccan Jewish food should be situated within a "vernacular cosmopolitan" framework (Werbner, 2018, p. 145). A framework that at the level of commensality operates within the context of vernacular cosmopolitanism operationalized through foodways, while depending upon the performative practice of a cosmopolitan ethnicity in order to achieve cultural legitimation (Jonas, 2013; Werbner, 2002; Werbner, 2018). This article aims to examine Moroccan Jewish foodways using the frame of vernacular cosmopolitanism which is made visible through the lens of "vernacular foodways" as well as the concept of the "food voice" as manifested in "culinary chats" (Abarca, 2006, 2023; Jonas, 2013). Meredith E. Abarca (2006, 2023) describes culinary chats as uncontrived conversations about food; and "food voice(s)" as powerful expressions of subjectivity connected to everyday encounters with food (p. 2, p. 4). The domestic sphere, which encompasses commensal gatherings "a` la maison or f'l dar" (at home) is interrogated as a site of cultural (re)production for the Jews remaining in Fes, Morocco. For the Fassi Jewish community, the domestic sphere primarily strives to maintain its vernacular culture and produce a simulacrum of their traditional family dynamics. These commensal gatherings "a` la maison or f'l dar" work to maintain the ethnic vernacular culture of the Fassi Jews through commensal hospitality. The domestic sphere is also where individual food voices are most fully articulated.

Breaking Bread, Breaking Silence: Food and Feminist Methodology in the Field

In research on gender-based violence, particularly in rural and marginalized contexts, establishing trust and creating emotionally safe environments is both ethically necessary and methodologically complex. This paper explores the deliberate use of food as a feminist methodological tool in ethnographic interviews on intimate partner violence (IPV) in rural Michoacán, Mexico. Drawing on fieldwork conducted between 2022 and 2023, I examine how shared meals—specifically *comida corrida* sourced from local women—served as an opening to conversations that might otherwise remain constrained by formality, stigma, and fear. The act of sharing food disrupted traditional

power dynamics between researcher and participant, transforming interviews into co-constructed, relational spaces where stories of survival, silence, and strength emerged more organically.

Through sensory engagement and cultural familiarity, food fostered emotional openness while simultaneously raising ethical questions around reciprocity, autonomy, and care. Building on literature in feminist and decolonial methodologies, this presentation reflects on the possibilities and limitations of incorporating food into qualitative research design. It argues that shared meals can challenge extractive research paradigms by centering relational ethics, cultural grounding, and the participant's comfort and agency. In breaking bread, this method also helps break silences-inviting narratives that are often buried beneath shame or social control. The paper concludes with reflections on how food-centered interviewing practices can be ethically adapted to other research settings, particularly those involving sensitive topics or structurally vulnerable populations.

Cultural and Spiritual Intermediaries: How traditional healers in Oaxaca, Mexico are preserving Indigenous food and nutrition knowledge

Migration profoundly impacts dietary behaviors, exacerbating chronic disease disparities among Latino and Indigenous Latin American Communities in Mexico and the United States. As Indigenous foodways shift away from nutritious, home grown foods toward ultra-processed diets, rates of Type 2 diabetes, obesity, and chronic kidney disease continue to rise. In Capulálpam de Méndez, Oaxaca, curanderos (traditional healers) serve as cultural and spiritual intermediaries, preserving ancestral food and health knowledge despite systemic pressures toward biomedical and Western dietary models. Their work represents a living connection to pre-contact health systems, offering pathways for chronic disease prevention rooted in Indigenous epistemologies. Using ethnographic methods, including semi-structured interviews with community members and curanderos, this study examines the cultural and structural barriers to maintaining traditional, nutrient-dense diets in the context of migration and globalization. Findings highlight how curanderos play a pivotal role in food sovereignty movements, advocating for the reclamation of Indigenous agricultural and healing practices. This research calls for a paradigm shift in food and nutrition spaces emphasizing the integration of Indigenous dietary wisdom alongside Western frameworks to address chronic disease disparities. By positioning curanderos within ongoing struggles for food and health justice, this study engages with the legacies of colonial erasure and the urgent need to decolonize dietary interventions.

Ethical Engagement in the Anthropology of Food: Community-Based Learning Across Disciplines

Through course readings, assignments and class activities, both Anthropology 378: Anthropology of Food (taught by Carla Daughtry) and Philosophy 115: Food Ethics (taught Chloe Armstrong) work in collaboration with the former Center for Engagement and Social Change (coordinated by Garrett

Singer) at Lawrence University to create a cluster of courses for students interested in food security and community-engaged learning. This flash presentation briefly introduces our courses and how we address various dimensions of food security with an emphasis on access and agency. The focal point centers on our community-based learning (CBL) course redesign process, including lessons learned from instructor reflection, and feedback from students, colleagues, and community partners. The CBL course redesign process includes two facets: 1) course pedagogy and assessment as codified in a CBL course design/redesign chart and 2) four values of ethical engagement (respect, beneficence, justice, reflexivity). Our collaborative experience in food studies underscores the value of introductory CBL experiences and offers teaching tips for instructors thinking about CBL pedagogies.

Measuring cultural food insecurity for culturally responsive food security interventions: What do we know and what matters?

Household food security is a significant public health concern that has worsened with increasing cost of living due to inflation, climate change, political instability, global, geopolitics, and the lingering effects of COVID-19. In Canada for example, 22.9% of Canadians lived in food insecure households in 2023, constituting 8.7 million Canadians, including 2.1 million children. Racialized groups, particularly immigrants and refugees are at heightened risk and in 2023; about 1 in 4 racialized newcomers in Canada were food insecure. Contributing factors to immigrants and refugees' vulnerability to food insecurity are – need for sociocultural adjustments in their host countries coupled with systemic resettlement challenges, which influence overall food security status and access to cultural/familiar foods. Cultural food security, which refers to the ability to acquire, afford, and eat the traditional foods of one's ethnic origin is an important social determinant of health, especially for migrants. It enables the continuation of food traditions and customs, which fosters cultural identity, improved health outcomes, and successful integration in the host country. Additionally, having access to culturally appropriate food serves as a lifeline for maintaining healthy dietary practices and fostering a sense of place in immigrants and refugees' post-migration experiences and resettlement.

In spite, its significance in the health and wellbeing of most migrant communities, cultural food insecurity has not been given the attention it deserves in the assessment of individuals and household food security. Existing studies food security rely on the FAO's four foundational dimensions (access, availability, utilization, stability) with limited to no focus on cultural appropriateness the foods and food initiatives available. Existing measures are criticized for their inability to capture the cultural dimensions shaping food preferences and diverse experiences of food insecurity. As a preliminary step to addressing this knowledge and substantive gap, we comprehensive review of existing food security indexes and qualitative interviews with immigrants in Canada to determine the existing indicators for assessing cultural food insecurity and the explore relevant indicators based on the narratives of the newcomers. In this oral flash presentation, we will share about the process we undertook, the existing measures and the indicators that matter to the

different immigrant populations with the goal of formulating a cultural food insecurity index. This is important in the creation of relevant tools for assessing food insecurity in a world that is experiencing increased migration.

SUNSHINE AND SUPPER: A QUALITATIVE STUDY ANALYZING THE IMPACT OF FEEDING TAMPA BAY'S FOOD PRESCRIPTION PROGRAM IN PINELLAS COUNTY, FL

This research evaluates the effectiveness of Feeding Tampa Bay's (FTB) food prescription (food rx) program in Pinellas County, Florida. Despite FTB's efforts to distribute nearly 15.8 million meals annually, thousands of individuals and families in Pinellas remain uncertain about their access to nutritious food. In many ways, food insecurity itself haunts these communities, casting a shadow of uncertainty and deprivation over individuals and families who are left to navigate the unseen and often overlooked barriers of unemployment, poverty, and systemic inequities that prevent them from accessing essential resources (Dewey et al., 2024; Feeding America, 2025). The Southern U.S. is particularly affected, with this region exhibiting the highest concentration of food insecurity in the country. Rural areas, in particular, struggle with high poverty rates, limited access to fresh food, lack of transportation, and elevated unemployment (Rabbitt et al., 2023; Owens, 2024). The persistence of these "ghosts" of inequality, haunting communities and systems, further exacerbates the problem, as eight out of the ten highest food-insecure counties in the U.S. are located in this region (Dewey et al., 2024). This study builds upon the ghost of a previous research study conducted by the University of South Florida's Department of Anthropology, which identified barriers and benefits to the program but suggested the need for further investigation to better understand clinical outcomes and improve program utilization. The current qualitative research applies anthropological theory, particularly Foucault's biopower and Mintz's political economy, to explore how systemic inequalities continue to haunt food-insecure populations. Through a detailed analysis of the food rx program's impact, this paper offers actionable recommendations to enhance the program's effectiveness and contribute to FTB's goal of a hunger-free Tampa Bay.

4111 Indigenous Foodways and Traditional Food Knowledge in North America

Start Date: 11/21/2025 8:30 AM **through** 11/21/2025 10:00 AM

Venue: Marriott **Room:** Balcony L

Type: Oral Presentation Session

This panel is presented by four scholars who conduct ethnographic research about Indigenous foodways throughout North America (also known as Turtle Island among Indigenous peoples), including diasporic Indigenous communities from Alaska to California. By centering traditional food

knowledge of the Dena'ina, P'urhépecha, Nahua, and Mexican peoples, our panel will demonstrate how Indigenous peoples engage in cultural resistance and resilience by utilizing ancestral knowledge and traditional culinary practices despite various colonial and neocolonial sources of oppression, marginalization, and erasure. Inspired by the theme of this year's annual meeting, our collective research represents the powerful omnipresence of ancestral knowledge within Indigenous communities as ancestral spirits guide descendants in honoring their traditional cultures as a source of intergenerational healing while enduring displacement from their homelands. With the hauntings of historical trauma initiated by colonialism and perpetuated by neocolonialism, Indigenous peoples continue to navigate decolonization through cultural continuity, preservation, and revitalization by participating in continued communal gatherings and placemaking in various foodway spaces to sustain traditional culinary practices and access to traditional foods. Food has emerged as a generative motivation for continuous communal gathering for Indigenous peoples, as the Indigenous communities featured in this panel reclaim their food heritage through traditional culinary practices, including the production of ancestral recipes passed down for generations and the consumption of Indigenous foods of their homelands, which provide critical nutritional and medicinal value. These acts of Indigenous survivance exhibit manifestations of social justice activism among multiple Indigenous communities to advocate for Indigenous food sovereignty, environmental relationality and reciprocity, traditional medicine, and anti-gentrification to advance communal wellbeing and efforts of decolonization.

Presentation(s): The People of Corn in a Corn-less Land: Cultural Identity, Medical Narratives, and the Place of Corn in Alaska

Corn—el maíz—is more than a staple; it is a sacred symbol of ancestry, identity, and belonging for many Indigenous and Latin American communities. Yet in Alaska, where the growing season is short and corn cultivation is rare, this foundational element of cultural life is largely absent from the land. This presentation asks: What does it mean to be the "People of Corn" in a place where corn arrives primarily in processed, imported forms—stripped of its cultural and nutritional significance? How do ancestral foods haunt contemporary lives far from their place of origin? Drawing on ethnographic research with diabetic and prediabetic Latinx people in Anchorage, we examine how biomedical narratives often pathologize traditional corn-based foods, such as tortillas, as unhealthy. As a result, individuals seeking better health are often pressured—explicitly or implicitly—to distance themselves from foods that hold deep ancestral meaning. This paper considers corn not only as a source of sustenance, but as a site of cultural resilience and symbolic power, where ancestral foodways haunt contemporary health practices in subtle but powerful ways. We explore the intersections of medical advice, migration, food insecurity, and cultural

bereavement, and reflect on how Latinx communities in Alaska navigate the tensions between health imperatives and the desire to honor foodways that carry the presence—and the longing—of those who came before.

Presenter(s): Gabriela Olmos Rosas

Anahuac to Alaska: Indigenous Foodways as Cultural Resistance and Resilience of the Mexican Diaspora in the Arctic

This paper explores the reclamation of Indigenous foodways by the Anahuacan (Mexican) diaspora residing in Alaska, highlighting their cultural resilience and resistance through the practice of traditional culinary practices. By examining the intersections of identity, environment, and food sovereignty, the study reveals how these communities draw upon ancestral knowledge to foster a sense of *buenvivir* (living well). Through interviews, participant observations, and the documentation of traditional food preparation and gathering techniques, the analysis illustrates the vital role of food in cultural preservation and community cohesion. The findings demonstrate that despite geographical and cultural dislocation, the community actively engages in the reclamation of their food heritage as a means of asserting their identity and promoting sustainability in their new environment. This research contributes to the broader dialogue on Indigenous resistance and adaptation, offering insights into how food serves as a powerful tool for cultural revitalization and social justice in the context of colonization and diasporic experiences.

Presenter(s): Itzel Zagal

Dena'ina Plant Knowledge and Food Sovereignty

Wild, culinary plants have long nourished Dena'ina people—physically, spiritually, and socially—diversifying a traditional diet centered on fish and game. Today this ancestral knowledge of wild foods (e.g., berries, greens, and roots) is part of a broader revitalization of traditional foodways that connect land, culture, and health. This research, conducted in collaboration with Dena'ina knowledge holders and within their ancestral homelands, explores historical and contemporary practices with wild, culinary plants. In a time of environmental change and ongoing colonial pressures, traditional food remains central to Dena'ina survivance, sustaining relationships with place, supporting intergenerational teaching, and fostering food sovereignty in both rural and urban areas of Dena'ina Ełnena. As an immigrant scholar drawn into the powerful ethic of care and reciprocity embedded in Dena'ina traditions, I reflect on the ways Indigenous foodways offer not only nourishment but also a model for healing and cultural resilience in the face of displacement and marginalization.

Presenter(s): Varpu Lotvonen

Placemaking in the Aguilillense Diaspora of Northern California: Indigenous Foodways and Ancestral Maternal Knowledge

The Aguilillense Diaspora of Northern California are originally from the pueblo of Aguililla, Michoacán, Mexico and initially established their diasporic community near Redwood City,

California in the 1940s following Aguilillense men's migration during the Bracero Program. Aguilillenses in diaspora still maintain a strong pueblo identity and ancestral connection with Aguililla as they continue to practice their traditional culture and honor their P'urhépecha heritage, especially through the production and consumption of the Indigenous food of Aguililla which is deeply guided by their ancestral maternal knowledge of traditional culinary practices. Aguilillenses from throughout the Northern California diaspora gather in various foodway spaces that are territorialized as Aguilillense to consume their favorite traditional dishes, meet with family and friends, share nostalgic memories of Aguililla, and discuss current happenings within the pueblo and the diaspora. Aguilillenses are experiencing simultaneous displacement in Northern California due to extreme gentrification and in Aguililla because of the extensive cartel violence in the Tierra Caliente region of Michoacán which has caused the pueblo to become a near ghost town. This paper will present ethnographic research conducted at multiple Aguilillense owned restaurants and taco trucks in Northern California, which have become major sites of Aguilillense cultural continuity, collective memory, and placemaking in diaspora.

Presentation(s): Castro went away, but Fidel stayed behind: the growth of multiple times and the disconcerting of society in Cuba

Different temporalities converge, as they chronologise and disconcert Cuban society today. While recent reforms have ushered liberal ideas of economic 'development' and business into popular expectations, official discourses and legislation continue to reiterate the historical progress towards socialism. When people still plan for careers, businesses, and life cycles based on anticipations of state policies and provisions, young Cubans begin to say 'there is no future' in the economic decline after COVID. As Party cadres talk nostalgically about the past ('lo antes'), millennial churches have proliferated among the revolutionary generations. Ghosts of Afro-Cuban 'religion' travel from the past, while different ideas of debt and uncertainty make threats from the future. Based on more than three years of fieldwork since 2017, this paper outlines the dominant conceptions of time in Cuba today and how they create senses of disorientation and division in the society. Drawing on Palmié's pioneering work on the anthropology of history, it seeks to show the

material forces and conditions that allow elements of the past to haunt the present and perceptions of the future to split the present. The Cuban calendar has perhaps already begun to confuse when Fidel famously declared that Cuba would 'retreat' to capitalism to reach socialism in the future.

Presenter(s): Peter Yuhao Yang

Cloudy with a 10% Chance of Persecution: Statistical Fictions and Risk Forecasting in U.S. Asylum and Convention Against Torture Claims

Asylum adjudication in the United States requires not only the narration of past persecution, if present, but also the substantiation of a "well-founded" fear of future harm. The U.S. Supreme Court has interpreted "well-founded" to mean that the applicant has a "1 in 10 chance" of persecution (*INS v. Cardoza-Fonseca*), thus effectively installing an unverifiable statistical probability threshold into the legal standard. In the event that an applicant is statutorily barred from asylum eligibility, the parallel relief mechanisms of Withholding of Removal (WOR) and the Convention Against Torture (CAT) hinge on an even more demanding threshold, requiring petitioners to demonstrate that it is "more likely than not" that they would face persecution, torture or death if returned to their home country. Such an analysis is particularly crucial in CAT claims, in which an applicant must establish a precise yet speculative chain of events whose unfolding would aggregate in a 51% or greater likelihood of their torture. This instantiation of non-mathematically grounded "probability" determinations is a key deciding factor for many claimants undergoing consequential immigration proceedings. While these hypothetical future events are not grounded in any formal statistical reasoning, they are confidently deployed in order to demonstrate a threshold of certainty when assessing individual applicants' uncertain futures.

Many anthropological treatments of asylum adjudication have highlighted the troublesome nature of using a transnational legal process in order to establish truths about what happened in the past. Less attention has been paid, however, to the role played by forecasting and future-oriented storytelling in these proceedings. Legal logics that require an applicant to demonstrate what would occur under hypothetical conditions are arguably more constitutive of asylum claims as those concerned with establishing what has occurred.

This paper examines how actors in the United States' asylum system engage in what I term "proleptic reasoning"-anticipatory judgments that work through hypothetical chains of events and, in so doing, archivally actualize this hypothetical future as past precedent. Through an ethnographic analysis of both key jurisprudence and daily legal practices, this paper explores how "probability" standards become operationalized as evidence in the production of legal truth within immigration adjudication. I contend that such modes of reasoning operate proleptically, as precedent made from such speculations becomes binding on cases that come after it, whether or not the events originally forecasted ever came to pass.

Drawing on the author's training in both law and anthropology, this paper examines both the sociolegal forms of thinking that gives rise to such quantitatively articulated standards as well as the

practical consequences of these standards for applicants seeking humanitarian forms of immigration relief.

Presenter(s): Daisy Hunter-Haydon

Honduran Migrants and the (Un)Makings of Asylum

Drawing upon ethnographic research with Honduran migrants in Washington State, and sustained expert witness testimony for more than 150 different Honduran asylum cases in the U.S. and U.K., this paper examines how Honduran migrants and asylum seekers reflect on how to most effectively communicate contexts of violence and organized crime to foreign immigration courts—who have little understanding of Honduran political realities on-the-ground, and amidst the haunting possibility of asylum itself ceasing to exist. My analysis emphasizes a marked shift in Honduran political culture since the 2009 military coup, characterized by heightened awareness of how the Honduran state works and how migrant receiving countries view these processes. I argue that such political consciousness informs asylum seekers' strategies for articulating their reasons for persecution and the Honduran state's inability or unwillingness to intervene effectively to alleviate violence.

The 'Perfect Migrants' Not Welcomed Either: Revisiting the Vulnerability and Deservingness of the Chinese Diaspora under Trump 1.0

Since the Reform and Open in 1978, the Chinese diaspora has emerged as a transnational asset for development. Through an expansive network of talent recruitment programs, the Chinese state has courted skilled returnees as engines of technology and economic transition. Among destination countries, the United States, historically the largest recipient of Chinese skilled migrants, pulled them in with a fertile ground for individual development, while the ascension of Donald Trump marked a profound discursive rupture. The normalization of accepting migrants who are more deserving and valuable was one of the characteristics of Donald Trump's political rhetoric of meritocracy and national renewal against illegal immigrants. Yet, the self-contradictory migration narratives of Trump's administration were highlighted when the most alleged "deserving" and high-achieving Chinese migrants were even flagged as non-traditional threats to U.S. national security.

This paper ethnographically examines the securitization of Chinese skilled migration during Trump's first term, exploring how diasporic individuals were reimagined through the lens of geopolitical rivalry. Drawing on a mixed-methods approach, it interrogates how state narratives and policy shifts disrupted the moral and social boundaries of belonging, rendering the Chinese diaspora politically hyper-visible but socially excluded. It argues that the Chinese skilled diaspora has become a site where global mobility is no longer a marker of integration or success, but rather a reflection of broader anxieties of a deglobalizing world. As U.S.-China relations deteriorated, diasporic subjects—once constructed and celebrated as perfect migrants—found themselves caught within an ambiguous terrain where citizenship, identity, and loyalty were continually questioned. By analyzing this transformation through the frameworks of securitization, deservingness, and diasporic

governance, the paper contributes to the political and anthropological debates on migration, national security, and the moral economies of citizenship. The findings reveal the paradox of deservingness surrounding perfect and skilled immigrants across the moral border, and the affective and material consequences of securitized migration regimes for those navigating life between territories.

Presenter(s): Yuewen Wu

Thinking with ghosts, spirits and other scary fuckers in the context of disasters and catastrophic events.

In this paper I examine stories gathered from fieldwork and from secondary research that pertain to the agency of the invisible, specifically the more than natural agents that inhabit human social worlds. This paper seeks to show how those at the receiving end of power work with the invisible and unseen, as part of their defensive strategies against exclusion and marginalization. I draw upon research conducted in coastal India after the tsunami of 2004, focusing first on state efforts to render people invisible so as to make it easier to dislocate them in the name of recovery. I then examine through vignettes compiled from fieldwork among communities facing displacement, the active mobilization of the sacred power of death, bereavement, loss and hope in staking claims to place. I aim to show readers that an anthropological study of stories people tell about what happened to them, and through these their relationships to place, reveals a rich array of invisible allies - spirits, ghosts, the restless dead, and others - who are as much a part of defensive struggles today, as are the equally important and more obvious political and social practices we commonly associate with resistance. Here, the living invoke the memory of the dead, or sometimes channel the power of the dead to stake or defend claims, especially when they are unable to do so with conventional tools such as appeals or legal processes. In short, I'm going to share with readers my fascination with the invisible allies of the oppressed in a world that demands more than human responses to the hell of capitalist tyranny. I conclude with a reflection of why the spectral remains a vital (even if unstated or understated) part of popular politics, especially when the stakes involved center on material social conditions and the reproduction of life threatened by the overwhelming power of the menacing vampirical combine of capital, state and social elites. I conclude by examining key differences and (potentially productive) overlaps between such a conceptualization of politics and those that focus on the deployment of religion in the service of political struggles.

This Is Not a Political Forum: Municipal Land Use Boards as Everyday Legal Space

Municipal planning boards are a locus of small-scale and, to some degree, publicly accessible decision-making about how land is used in the United States. At planning board meetings, elected and/or appointed officials, planning experts, attorneys, and members of the public scrutinize, debate, and ultimately pass judgement on proposals for local development projects. As such, planning board proceedings are constituted through political struggle. Yet, participants often describe the planning process as structured by apolitical legal frameworks, as "quasi-judicial" in

nature. This creates a tension between the imagined space of municipal land use planning as a neutral arena of decision-making and how it is constituted on the ground.

This presentation draws on over a year of ethnographic research in "Watertown," a community in suburban central New Jersey that has been embroiled in a multi-year battle over warehouse construction waged on the floor of local planning board meetings. Following a group of involved members of the public as they make their case against warehouse development, this presentation considers how planning board meetings are constructed as a "quasi-judicial" legal space that admits only certain forms of participation and evidence presentation. It contends that municipal planning boards are a site of everyday law, namely "the manifestations, performances, contestations, and constitution of the informal and official law in mundane places and situations" (Kymäläinen 2024, p. 353). It considers the material and discursive space of the planning board meeting as a living field of interaction where "law is experienced, practice, translated, reappropriated and in turn redefined by its many users" (Cloatre and Cowan 2019, p. 447).

This presentation argues that in order to render themselves and their arguments legible to the planning board, local activists fashion themselves as "citizen experts." The counterevidence they present, however, reveals intractable gray areas in planning law and a fundamental vagueness inherent in local zoning ordinances. This presentation concludes with a discussion of the potential political openings generated by both public participation in land use planning and the gray areas revealed in the process. Engaging with Kai Bosworth's (2022) concept of "resigned pragmatism," this presentation questions whether public participation further entrenches the hierarchies embedded within municipal planning boards and how they might be contested by other means.

"We Must not Allow the Tragic Outcome in Indochina to be Repeated in Central America": U.S. Narratives of Counterinsurgency in Central America

During the 1980s thousands of US personnel traveled to Central America as part of a counterinsurgency project aimed at stopping the alleged "spread of communism" in the region. Some of them were Peace Corps, helping build wells, others were Engineer Corps building schools and bridges, while others were soldiers taking part in massive joint exercises with the Central American armed forces, and yet others were Green Berets training the regional special forces in their fight against the guerillas. At the same time, according to the official statements of the Reagan

administration, the US was not involved, in any shape or form, in a war in Central America. In this presentation, I contrast the narrative of the US government with stories told by US personnel, who speak about the Central America of the 1980s as a theater of war. With many of them going so far as to compare their time in Central America with prior experiences in the Vietnam war.

My objective is twofold: first, to analyze the involvement of the US in Central America during the 1980s from the perspective of those who were "on the ground" and produced it. Raising questions in the process of the official story of this conflict. Second, to think critically about the tensions between ideas and narratives of peace and war when we think about US involvement abroad, and the longer historical thread of counterinsurgency warfare connecting the occupation of the Philippines with the Vietnam War, Central America, and beyond.

Presentation(s): Class Conflicts and Dignity in Labor: A Public Sector Union's Struggle to Represent Government Employees

As the working class struggles with stagnant wages, institutional reorganization, and threatening redundancy, what are the prospects for unionization and collective action? While private sector unionization has declined, public sector unions have grown since the 1960s even while battling legislative restrictions, distributing benefits and protections to a limited segment of the working class. What strategies can be implemented to spread unionization's benefits and protections to more of the working class? My research investigates questions regarding one public sector union's challenges and goals to suggest future pathways for solidarity-building action in an increasingly divisive political climate. The Fairfax Workers Coalition (FWC) is a grassroots labor union of county government employees that represents members' grievances and fights to forge policy changes to bring greater dignity to county-employed laborers. In this presentation I will outline the context and significance of this growing union and discuss the structural obstacles they face in effectively representing workers. With over 600 members, the FWC advocates for improved labor conditions, transparent and reliable pay step scales, and they represent employees' grievances. Both the FWC and its competitor, a local chapter of a national union, are campaigning to be elected to represent all county employees in collective bargaining, which was only legalized and implemented for

governmental workers in Virginia in 2021. The current county ordinance places all 12,000-plus employees in one single bargaining unit, which is highly unconventional. The FWC is working to change the ordinance, arguing that it violates state law and creates a conflict of interest. Many members convey a strong sense of duty and commitment to their work, viewing their lower pay in comparison with similar private sector positions as a tradeoff for the job security and benefits they receive. Budget and position cuts, alongside recent political developments, have given these workers a growing sense of precarity, which severely undermines this tradeoff. Individuals' job insecurity and legal strategies that incentivize individual action contribute to employees' reluctance to unionize or engage in collective action, a tendency evident in the history of American organized labor. Union decline has been accelerated by decades of anti-union political lobbying, restrictive governmental policies, protracted lawsuits, and juridical structures that favor employers, all of which detract from union organizing and outreach efforts. Private sector unionization rates have recently increased, and current research demonstrates that 60 million working Americans would join a union if they could, yet a gap in access remains, particularly in "right to work" states. The struggles of growing local public sector unions can shed light on the dynamics and challenges of coalition building, and emergent strategies for effective collective action.

Ghosts in the Lab: Worldmaking, Belonging, and Resistance in a STEM University

What kinds of worlds are made in university labs-and for whom? Drawing on ongoing ethnographic fieldwork in cross disciplinary lab spaces at a U.S. public university, this presentation explores how students and faculty navigate, reproduce, and resist the sociopolitical structures that haunt STEM learning environments. Combining feminist ethnography (Davis and Craven 2022), critical university studies (Singh and Vora 2023), and worldmaking (Kondo, 2019), I examine how lab members engage in everyday acts of collaboration, care, and reparative creativity (Kondo, 2019) that challenge dominant norms of productivity, inclusion/exclusion, and expertise. In these spaces, "ghosts" appear in the form of institutional memory, exclusionary traditions, and unacknowledged labor, but so do counter-practices that reimagine what learning and belonging can look like. This project contributes to anthropologies of education, political economy, and critical universities studies by foregrounding lab spaces as both material infrastructures and affective sites of transformation. As universities increasingly turn towards innovation rhetoric and respond to political assaults on higher education, this research interrogates who gets to shape these futures-and how lab work is (or is not) supported. Ultimately, this presentation invites reflection on the possibilities of co-creating more creative and reparative educational worlds within and beyond the academy.

Presenter(s): Rebecca Martinez

Motorcycles Custom Shops as Spaces of Post-Repair Pedagogies for A-Technical Bikers

How and why do a-technical users of digital-era bikes (seek to) learn to repair motorcycles? In Romania, as elsewhere, over the last few decades, more and more middle-class people have entered motorcycling. Among them, there is a subgroup, also growing, of motorcyclists who

purchase, refurbish and customize old carburettor bikes, a practice that I label retro-repair. Although the maintenance and repair of one's bike is limited to the still sizable, but inevitably shrinking group of carburetion motorcycles, maintenance and repair continue to have an immanent attraction in idealized representation of motorcyclists. Through customization, old motorcycles are brought back to life and reinvented, in a rich web of narratives told by bikers to themselves, to other bikers and to non-bikers. Taking a motorcycle custom shop from Bucharest as an ethnographic entry point, I describe the material, bureaucratic and narrative social lives of older motorcycles that undergo customization.

Personhood and the Future of Work in 'the Age of A.I.': Lessons from Anthropology and the SAG-AFTRA Video Game Strike

Since 2023, one of Hollywood's most visible and influential labor unions, SAG-AFTRA (The Screen Actors Guild – American Federation of Television and Radio Artists), has been at the forefront of defining what the future of work in 'the age of A.I.' should look like. While the union's historic 118-day labor strike ended in November of 2023 with fanfare and significant contract wins, less known to the general public is that SAG-AFTRA's video game strike is still ongoing. Drawing on ethnographic fieldwork exploring the social worlds of media workers, discourse analysis of recent judiciary hearings on proposed A.I. policy for digital replicas, and insights gained from anthropological research on the cultural impact of other emerging technologies (such as biotechnology), this talk describes how striking video game performers are creating opportunities for new forms of personhood to emerge from the struggles for labor futures.

Presenter(s): Jessica Dickson

Real-Time Work: Temporal Care and Control in Public Transit in the City of Chicago

This paper explores "temporal labor" (Sharma 2013; Bear 2014) in public transit in the U.S., based on fieldwork with bus supervisors and controllers in South Chicago, focusing on how time is enacted in their day-to-day practices. It examines how supervisors, primarily terminal supervisors, "care" (Denis & Pontille 2014) for time. It then juxtaposes this care for time with the "monitoring" and "adjusting" of time-practices through which time is recognized in routinized operations as an object of technical control.

The orientation of care toward time involves aligning and organizing one's work-time around the work-time of operators, practicing vigilance and selective attention to the temporal consequences of events that occur outside the jurisdiction of a terminal supervisor, and engaging in affective labor. At the same time, caring for time does not contradict efficiency or speed. Rather than being slow and sustaining, it involves fast, real-time decision-making.

This paper argues that "care" is not only a mode of practice but also serves as a governing logic that enforces temporal order in parallel with institutional and technical "control." While control is increasingly centralized in locations where data and communication technologies converge, care

for time is centered in terminal locations that function as critical "time-points" in the work of bus operators. The work of terminal supervisors is, for the most part, invisible to institutionally enforced processes of control. This invisibility, in turn, facilitates the flexibility and improvisation that care requires.

Presenter(s): Raha Peyravi

Shunned and Celebrated; Haunted yet Liberated: How Employed Middle-class Full-time RVers Negotiate Historical Stereotypes Against Housing Realities

This paper explores how an emerging demographic of full-time Americans living in Recreational Vehicles (RVs)-middle-class, employed individuals that elected to move out of houses and rentals-navigate the social and symbolic terrain of housing and identity against a haunted past. Through three years of ethnographic research, semi-structured interviews, and analysis of popular cultural media, this study examines how this developing demographic of full-time RVers grapple with the haunted ideal of American home (and land) ownership against the rising popular sentiment around RV living, by interrogating how cultural memory, stigma, and aspirational ideals of domestic life continue to exert force on contemporary housing decisions.

By using haunting as a theoretical framework, it enables us to connect present realities to the past to deeply illustrate the residual presence of historical housing ideologies. In the U.S., the model of the single-family, owner-occupied home-anchored to privately owned land-has long served as a symbol of moral virtue, economic success, and social legitimacy. Born of settler colonial land practices and entrenched through postwar federal housing policies, this ideal seen in the traditional "American Dream" continues to shape contemporary understandings of proper home, and perhaps more importantly, land ownership. Those who do not conform-renters, the unhoused, mobile-home residents, and other 'quasi-homeowners' (those owning the structure but not the land)-are often cast as morally deficient and socially deviant. These judgments, while deeply historical, remain active, spectral forces that haunt present-day housing realities for RVers.

Full-time RVers-even those who live in legitimately recognized parks and are employed-are frequently entangled in this cultural haunting and continue to encounter the ghost of stigma through terms like "trailer trash", echoing back to Depression-era uses of RVs as emergency housing for the poor. At the same time however, full-time RVers face praise, enthusiasm, and wonder from co-workers, friends, and strangers for their life on the road and perceived freedom. Occupying a lineal space-between housed and unhoused, celebrated and shunned, haunted and liberated-illustrates how longstanding cultural memories of the past linger and continue to haunt the present. This paper contends that full-time RV living is shaped not only by economic realities, but by the cultural residues and inherited narratives that refuse to fully disappear. By engaging haunting as a lens in which to explore full-time RVing for this rising demographic, this work contributes to interdisciplinary conversations about housing, decision-making, and the American Dream. It argues that to understand the experience of full-time RVers is to confront the unfinished business of the American Dream-and to trace the ghostly contours of a national imaginary that continues to privilege land ownership in the U.S.

Presenter(s): Jessica Gleason

The phantasmagoria of serious games as a common thread in the evolution of workplace relationships..

In France, since a reform of vocational training in 2008, a training economy has developed to quickly become a lucrative market (€40 million generated in 2010, a large part of which came from public subsidies), namely digital vocational training, including e-learning and serious games.

Based on my field experience carried out between 2011 and 2016 as a Game Designer for a Serious Game company specializing in management strategy and human resources management tools, where I used my knowledge of management sciences, information and communication sciences, I kept a set of field notebooks, in which I detailed the procedural elements of serious games, the educational challenges and their technical and narrative interpretations, relating to the game scenarios and their technical structure, i.e. the gameplay. This collection of materials provides a record of a period when the objectives of these new training tools were being developed.

Since then, the impact of serious games on socialization has been widely documented and these technologies have been incorporated into relevant medical and educational devices. Some authors talk about a reprogramming of the self, an image that goes hand in hand with Lacanian psychological constructivism, Lacan being often used in management and its theories of commitment based on a certain idea of subject theory in particular.

In this context, drawing on the theatre of phantasmagoria, 'the art of making ghosts speak in public' as a mechanism of a fantasized reality, and on my experience as a game designer, I will propose to consider gamification and serious business games as a vehicle for behavioral scripts that are invisible to the subject, who is then unaware of the phantasmagorical effect produced by the use of 'gamified' environments. This effect seems to operate in the social field of work and contribute to the emergence of behavioral norms integrated into corporate culture.

I will show how normative and individualizing rituals are framed by a phantasmagorical mechanism that allows the subjectivation at work in the human-machine relationship during learning sessions to persist in reality. This phantasmagorical effect belongs to the invisible, fantasized realm that plays out between the subject and the subject's avatar in the simulation game.

In conclusion, I will propose an opening with the economy of artificial intelligence and its mainstream commodities.

Presenter(s): Anais DJOUAD

The Road to Mons Mouton: An Ethnographer on a Lunar Mission

Late in 2019, I began work on a NASA lunar mission known as the Volatiles Investigating Polar Exploration Rover (VIPER) mission. On this mission, a tele-operated robot would be launched to the lunar south pole where it would be directed in near-real-time to conduct science investigations. The VIPER scientists would be co-located in California's Silicon Valley, at NASA Ames Research Center,

and would need a work system to support fourteen days of continuous 24/7 operation, which would repeat four times over four months. I figured that the end of the robot's operations on the Moon would be the end point of my research timeline on the mission as well. I joined the mission in part because I knew it was possible to build the work system based on my research as a work ethnographer in several projects with scientists working with remotely operated robots in extreme environments. I was confident that the timeline was suitable for conducting ethnographic research to develop and test a work system and participate in its adoption. With this in mind, I would also join for another reason. As an ethnographer who uses a multi-sited approach, I was just completing a project with scientists using robots for deep-sea science designed to be juxtaposed with scientists using robots on Mars (NASA's Mars Exploration Rovers mission, "MER"). The VIPER mission would be an opportunity for a long-term study that could allow for juxtaposing two space missions.

When I joined the VIPER mission Science team, it was three years before the robot was to land at the lunar south pole. The selection of a geographic site for science data collection and exploration had not yet been selected, and the area had not yet been named Mons Mouton, by the VIPER Science team. But a large number of the mission's structural components were underway. And the material conditions required to enable the science team to become part of the mission operations apparatus would have to be developed quickly in order for there to be enough time for some of the science team's culture to become part of the mission's existing structure and culture. As of winter 2025, milestones have been reached that allow me to begin analysis across three sites. In this flash presentation, I will present a juxtaposition of scientific knowledge production with scientists using robots on Mars, in the deep sea, and on the Moon.

4683 Texas Identity, Marginalization, and Belonging: The Shaping of Local and National Discourse in the Lone Star State

Start Date: 11/21/2025 8:30 AM **through** 11/21/2025 10:00 AM

Venue: Marriott **Room:** Bonaparte

Type: Roundtable/Town Hall

Texas - a state that was once a Republic, a buzzword in national politics, a sanctuary for some, what's been described as a war zone for others, and for over 30 million people - home. In this roundtable, anthropologists and humanities scholars of different backgrounds come together to examine Texas through the lenses of representation, race, education, gender, performance, and migration. We aim to critically explore which identities and histories are valued and cared for within the context of the state and which are overlooked or actively marginalized. Through discussion, we will interrogate processes of identity centralization and enhanced care and hold these in contrast to projects of oppression and marginalization. We will also reflect on the use of both "traditional" qualitative methodologies and those considered "disruptive," particularly in the context of diverse communities in Texas. These approaches offer critical tools for engaging with the complex realities of Texan communities, their heritage, and their claims to culture and belonging. Our research

locations include: San Antonio (Bexar County), Houston (Harris County), Austin (Travis County), and the South Texas region (Brooks, Hidalgo, Cameron, Starr, and Maverick County).

The state of Texas's unique historical trajectory - from its pre-contact Indigenous populations and European colonization to its independence and integration into the United States - has engendered distinct cultural identities that shape local and national understandings of Texas and its peoples. Like other colonial projects, violence, enslavement, and oppression at the hands of European colonizers and Anglo settlers are imbued in Texas history. By centering these historical and ongoing dynamics, our roundtable seeks to unpack how notions of identity and belonging in Texas are not only socially constructed but also products of successful colonial strategies. In doing so, we offer a framework for analyzing contemporary issues in the state, one that not only traces historical roots but opens space to extrapolate and reimagine futures in and about Texas grounded in equity, inclusivity, and community.

2813 Part 1: Queer Demography: Thinking Sexuality, Gender, and Kinship in an era of Population “Decline”

Start Date: 11/21/2025 8:30 AM **through** 11/21/2025 10:00 AM

Venue: Marriott **Room:** Galerie 1

Type: Oral Presentation Session

Over the past two decades there have been mounting transnational demographic transformations related to low fertility rates, decreasing marriages, and greater economic interdependence with immediate kin. In the afterlife of neoliberalism and austerity, the lines among wage labor, welfare, and kinship are being redrawn (Martin, Wig, and Yanagisako 2021) and new politics of dependence, personhood, and survival are emerging. This panel asks after the place of sexuality, gender, kinship, and normativity amidst the socio-economic changes wrought by demographic "declines." How do pronatalist state policies and other "demographic anxieties" (De Zordo, Marre, and Smietana 2022) affect queer and trans reproductive politics and family formations? What new forms of subjecthood, survival and kinship emerge as individuals negotiate newfound economic and social dependencies? What do demographic changes mean for hegemonic notions of "straight time" (Wool 2021; Boellstorff 2007) which stipulate economic independence as a pre-condition for a heteronormative life? What subjects become "queered" (Weiss 2022) under these conditions, beyond queer and trans populations? How do age, race, legal status, disability, and other dynamics intersect these processes?

Our panelists collectively seek to address these and related questions through ethnographic research situated in diverse cultural and social milieus. Part 1 of this panel explores relationships between demographic shifts and reproductive politics, critically examining the ways changing reproductive hopes, imaginaries, and foreclosures shape individual, collective, and national horizons of futurity. Part 2 of this panel relatedly focuses on demographic change and transformations of intimacy and kinship, especially those which complicate discreet identity categories and conjugal relationships. Beyond a focus on "queer" as a marker of just non-normative desires and subjectivities, our panelists collectively explore "queer" relations and connections which exceed fixed domains and normative frameworks- in the process opening new epistemological, relational, and theoretical vistas into demographic change.

Presentation(s): The Slow Revolution: Queer Mobilities and the Crisis of Masculinist Growth in China and Beyond

East Asia's transition into ultra-low fertility has disrupted capitalist economies reliant on abundant, exploitable labor, fueling demographic anxiety and aggressive pro-natalist policies. In China, official panic over declining birth and marriage rates exposes tensions between demographic shifts and hetero-patriarchal state power. As women surpass men educationally worldwide, their reproductive decisions constitute a slow revolution that profoundly reshapes patriarchal norms, masculinist agendas, and hegemonic timelines of marriage and reproduction. Drawing on two years of ethnographic research and over 60 interviews with students from China using Singapore as a migration hub, this paper argues that student migrants, despite their modest numbers, epitomize this revolution and wield outsized discursive influence through social and digital media. Focusing on unmarried "leftover women" (shengnǚ) and queer and trans migrant women, it highlights emerging solidarities rooted in shared experiences of marginalization and agency, while showing how persistent queerphobia constrains alliances and complicates collective transformation. Contributing to burgeoning ethnographic work on queer demography, the paper situates China's slow revolution within broader global struggles against hetero-patriarchal state power, characterized by pro-natalist, queerphobic, and xenophobic reactions to degrowth, social ageing, and transnational mobility.

Presenter(s): Zachary Howlett

Reproductive Citizenship in a Time of Demographic Anxiety: Assisted Reproductive Technology Access and LGBT Childbearing in Taiwan

How might we understand the stakes of LGBT childbearing in a time of growing demographic anxieties? As conflicts over reproductive health and assisted reproductive technologies (ART) intensify globally, they percolate through national-level marriage and family policies to foster hierarchies of privileged and marginalized reproductive citizens. This paper examines recent LGBT childbearing debates in Taiwan following the country's 2019 legalization of same-sex marriage and coparental rights. Despite one of the lowest birthrates in the world, Taiwan legally restricts ART access to heterosexual spouses with proven infertility, excluding singles and LGBT couples who must pursue ART-mediated conception in third countries, further stratifying reproductive rights. Building on ethnographic research with LGBT (intending) parents in Taiwan, this paper interrogates the fault lines and "strange bedfellow" coalitions taking shape in ART access and surrogacy debates. It addresses emerging tensions between feminists and social conservatives who oppose surrogacy for commodifying women's bodies and reproductive labors and gay men and LGBT rights activists who support gay fatherhood and LGBT childbearing. Situating these conflicts in shifting configurations of hetero- and homonormative reproductive citizenship, the paper traces the ripple effects of demographic anxieties amidst changing evaluations of intergenerational kinship and diverse family-making practices.

Presenter(s): Sara Friedman

Hauntings in/of the Pediatric Gender Clinic: Reproductive Futures of Transgender Youth in a Reactionary Present

The reproductive futures of transgender youth have become a flashpoint in ongoing reactionary attacks on trans medicine, rights, and existence in the contemporary US. Meanwhile, loss of fertility represents the most fraught aspect of youth medical transition for many parents and health care providers. This emotional and affective salience, I suggest, speaks to/through the hauntings of a multi-temporal assemblage of ghosts of the past (marginalized peoples forcibly sterilized throughout US history, trans youth abused by 20th century medicine or lost to suicide) alongside specters of futures foreclosed (imagined children never born, normative families never formed). Drawing on ethnographic fieldwork in a US pediatric gender clinic, this talk explores how anthropological analyses can help youth, families, clinicians, and activists honor these insistent presences while simultaneously contending with urgent reactionary threats to trans life and attendant fears of our own ghostly futures. I argue that trans (and) reproductive medicine's attempts to establish a "radical break" with past harms, as well as broader ideas of political "backlash," inadvertently soften reactionary violence by placing it "out of time" (Simpson, 2018). At a time when 26 states have banned pediatric gender care, I consider how queer and medical anthropologists can disrupt popular teleological logics of generational "progress" in ways that combat rather than enable reactionary agendas.

Presenter(s): Taylor Silverman

Pronatalism and its Discontents: Queering Reproductive Reluctance

Selective pronatalism based on techno-optimistic visions of a heteronormative, genderless future increasingly haunts the rhetoric of politicians, silicon valley CEOs, and conservative think tanks in the United States. Such rhetoric is often grounded in the ideal of the "traditional family" and justified by the economic and social threat of falling fertility rates. While fertility rate decline, like overpopulation (Subramaniam 2018), is not in and of itself a problem, reproductive hesitancy among Millennials and Gen Z adults has been described as the result of ecological, political and social environments that threaten individual and collective futures (De Zordo, Marre & Smietana 2022; McMullen & Dow 2022). Based on collaborative research conducted by and with queer and/or Latiné young adults in Tucson, Arizona, this paper thinks through what it means to desire future reproduction at a moment characterized as increasingly uninhabitable, discriminatory and hateful. How do climates of reproductive rights restriction, transphobia, discriminatory deportation and rising heat in the US Southwest shape the ways that queer young adults think about their (non)reproductive futures, and futures of kinship more broadly? How might political, economic and ecological futures be creatively revitalized through understanding reproductive reluctance among queer young people today?

Presenter(s): Janelle Lamoreaux

Of Demographic Queering and Straightening: Reproductive Politics and Privatization in South Korea

This presentation explores how demographic anxieties and pronatalist governance are shaping queer reproductive politics. In South Korea, like many other contexts, austerity and economic precarity have contributed to low fertility rates, decreasing marriages, and deeper interdependence with immediate kin. These transformations have also brought about pronatalist policy regimes that promote heterosexual marriage and reproduction by tying them to welfare provisioning. To better grasp what these developments mean for queer and increasingly non-reproductive populations in Korea and elsewhere, I propose an analytic framework of demographic queering and straightening. These concepts account for how non-reproductive populations become "queered" in relation to dominant notions of heteronormative adulthood based in financial independence, marriage, and parenting, as well as how pronatalist policies attempt to "straighten" them in return. Using data from ethnographic research with queer and lesbian couples in South Korea, I contend that demographic straightening combines with other forms of cisheteronormative inequality to privatize and marginalize reproductive futures for both queer identifying and demographically queered populations. I argue that these developments not only ask us to rethink the place of heteronormativity in anthropologies of demographic change, but also narratives of critique around same-sex marriage in queer and feminist theory.

2683 What Remains? Legacies of the Anthropological Skeleton

Start Date: 11/21/2025 8:30 AM **through** 11/21/2025 10:00 AM

Venue: Marriott **Room:** Galerie 2

Type: Oral Presentation Session

Bones are one of the most salient images popularly associated with anthropology – this despite contested histories of skeletal collecting, typological racialization, and the siloing of osteological subfields within the discipline. At the same time, anthropological practitioners and ideas continue to shape understandings of the human skeleton across a vast breadth of locations, from archaeological excavations to disaster sites to investigations of mass atrocity, homicide, and suspicious death, not to mention fictional representations based on them. The histories and practices around the anthropology of the skeleton thus circulate and manifest in unexpected ways and places. Based on the principle that cross-field collaboration, rather than increasing isolation, is necessary to address this array of legacies and institutions, this panel brings together scholars from bioarchaeology, sociocultural anthropology, forensic anthropology, the history of science, and science and technology studies. Across a variety of contexts, we ask: how do the afterlives of twentieth-century anthropology mold the way in which bones are talked about, physically treated, and enrolled in intellectual and political projects?

This set of concerns responds to critiques that the dividing line between anthropology and biology has never been clean or complete (Visweswaran 1998). They are especially crucial following new changes to the Native American Graves Protection and Repatriation Act last year, showing that what it means to ethically engage with, and work toward repair for, practices of dispossession remains fraught with problems of implementation and political will. And because anthropological orientations to the human skeleton and its evolution have been key to pedagogical approaches in the discipline, bones have been employed in (re)producing anthropological knowledge inside the classroom as well as outside of it (Colwell and Rutherford 2025). In thinking across historical, theoretical, and practical approaches to the anthropology of the human skeleton and its uptake, this panel opens space for new perspectives on a topic with a long (and ever-present) past.

Presentation(s): "Bones" as a Social Construct: Instantiating Images of Social Beings in Biological Anthropology

Positioning the skeleton as material remains of a once living, social being, bioanthropological research utilizes osteological analyses to reconstruct human identities and experiences. Osteological analyses allow biological anthropologists to transform individuals into accessible units for scientific inquiry. We put forward that the practice of osteological analysis creates "Bones" - static images of complex biosocial beings that are inextricably linked to both the disciplinary milieu within which they are created and the interpretations of the practitioner. Tracing bioarchaeology, forensic anthropology, and museum anthropology methodological practices, we identify five images instantiated by osteological practitioners to interrogate how "Bones" are circulated in service of colonial ideologies and narratives surrounding the marginalized communities that are often centered in osteological research. By identifying and understanding the extent to which these methods - and the "Bones" they create - remain colonized, bioanthropological practitioners can then incorporate alternative approaches to the analysis of human remains that subvert convenient and hyperportable representations, towards producing more holistic representations of the peoples studied by our discipline.

Reconceptualizing Ambiguities in Sex Estimation: A Case Study of Presentation Trends at the Society for American Archaeology Annual Meetings

Ambiguity in sex estimation poses a persistent challenge for bioarchaeologists reconstructing past demographics. While standard methods create space for uncertainty through "probable" or "ambiguous" categories, those entering the field are often trained to treat such individuals as data outliers—removing them from analysis. Drawing from second- and third-wave feminisms, recent feminist and queer critiques of bioarchaeology have called attention to the epistemological limits of binary sex models embedded in analytical norms. Yet theoretical advancements do not always lead to timely methodological change. It remains largely unexplored how the field has integrated and responded to these critiques.

This paper examines how feminist and gender/queer theories have—or have not—shaped disciplinary discourse and practice by tracing thematic shifts in presentations at the Society for American Archaeology annual meetings from 2005 to 2022. Through content analysis of conference abstracts and selected case studies, I explore how ambiguity has been framed: as an analytical category, a technical problem, or a site of theoretical potential. While rhetoric of inclusivity and recognition of ambiguous identities has gained some acceptance, ambiguity in the data itself remains sidelined. By analyzing this tension, this paper considers how we may reconceptualize ambiguity in sex estimation and translate theoretical insights into pedagogical practice and training for future bioarchaeologists.

Forensic Intimacies: On the Treatment of Bones in the Bass Archive

William Bass, the larger-than-life forensic anthropologist who founded the first human decomposition research facility, also filmed and produced some of the earliest training tapes for police officers on assessing skeletal remains. Through close archival engagement with Bass's tapes and papers, as well as his fictional and autobiographical written narratives, this paper examines how bones get stabilized as sites of human identity in the meeting of anthropological and police practice. Proposing that forensic ideologies entail not just the abstraction and depersonalization of human remains but also intensely intimate labor, I train my attention on two episodes: Bass's early work excavating Native American remains with the Smithsonian Institution and his work on the unsolved homicide of Mary Louise Downing. In tracing the way that both osteological and narratological materials from these episodes reappear in police training tapes, I consider the extent to which forensic science's mastery of the past requires, too, other forms of social mastery that implicate marginal bodies. This raises the question of what justice means under regimes of forensic knowledge production, and how anthropological racial types continue to circulate far beyond the academy. I conclude with a consideration of "treatment" as a site at which to start cross-disciplinary rethinking on theories and ethics of human skeletal materials.

Fordisc and Historical Insights into Race, Statistics, and Ancestry Estimation in Anthropology

This paper examines the enduring legacy of race science in biological anthropology through a critical analysis of Fordisc, software used by forensic anthropologists to estimate ancestry from unidentified skeletal remains. Despite disciplinary shifts away from race-based typologies, we show how statistical methods and datasets rooted in colonial science continue to structure contemporary practices. Using an interdisciplinary "data journeys" approach (Leonelli & Tempini 2020), we first trace how skull measurements from colonial contexts—such as "specimens" in Cambridge's Duckworth Laboratory—remain embedded in Fordisc's reference data. Drawing on archival research, interviews, and STS analysis, we then examine how scientific tools absorb and reproduce historical ideologies, even when race is not explicitly named. For example, the Mahalanobis distance - a core algorithm in Fordisc - was adapted from early twentieth century race science. As it circulates across disciplines today, to what extent does it still carry forward its original assumptions? We argue that anthropology must critically reckon with the colonial and racialized roots of its data infrastructures.

3591 Ghosts of Past Policies: Understanding the Rapid Changes in Policy for Marginalized Populations

Start Date: 11/21/2025 8:30 AM **through** 11/21/2025 10:00 AM

Venue: Marriott **Room:** Galerie 3

Type: Oral Presentation Session

On January 20, 2025, Donald Trump was inaugurated as president and immediately began issuing executive orders that negatively impact marginalized populations. One such policy halted the United States Refugee Admissions Program, leaving thousands of refugees trapped in dangerous conditions. Trump also immediately enforced violent immigration policies, deporting asylum-seekers and im/migrants in the United States. Sweeping immigration policies also marginalize im/migrant populations with threats of fear, detainment, and deportation. Threats to other departments within the government are targeted at multiple offices that could affect marginalized populations across the United States and throughout the world. This creation of policy chaos has left many people living in the United States in fear of what policies may come next contributing to individual and community precarity. Further, the speed at which these policies have been enacted create a "shock and awe" effect whereby part of the population is thrown into chaos. We argue that such policies negatively impact already marginalized populations, perpetuating inequality and forms of violence such as structural and symbolic. Yet, there are groups that seek to resist these policies. For example, protests have sprung up throughout the United States against these new policies such as the "Hands Off Protest" that drew thousands of protesters of the current administration and the policies it has enacted. Further, there has been opposition among humanitarian organizations as well as institutions such as the National Institutes for Health through lawsuits in Federal courts. This resistance is critical to combating the negative policies enacted by the current administration.

In this panel, we examine the effects of these new policies on marginalized populations to determine the negative impacts that they create in these communities. We bring varying perspectives on the rapid policy changes of the current administration. We examine topics such as im/migration policy and deportations, abortion access and women's reproductive rights, refugee

admissions, policies that affect LGBTQ+ populations, and the removal of Diversity, Equity, and Inclusion programs from university education. Our research topics vary, yet they are all negatively impacted by policies enacted by the current administration. These policy shifts negatively affect the agency of populations, marginalizing and keeping them in a liminal state where they are subjected to state control. The topics presented here demonstrate the precarity of marginalized populations through these policy changes. This panel aims to shed light on rapid new policy perspectives and how they are detrimental to populations in the United States.

Presentation(s): Ghostly Changes? Pondering the Future of Refugee Resettlement in 2025

Building on the theme of 'ghosts,' this paper explores ghostly representations of refugees both historically and at the present time. Including resettlement workers (many of whom are former refugees), I argue for the importance of long-term ethnography to understand and give humanity to those experiencing budget and job cuts, political harassment, or worse at this present time. Focusing on the radical changes to refugee resettlement and immigration policy in the spring of 2025, this paper will specifically explore how policy changes have been experienced in west-central Florida. Navigating radical policy changes is not new in Florida. This paper asks, what is new about this particular set of changes? Drawing data from refugees, resettlement staff, and personal experience, this paper will ponder and challenge narratives of these changes as 'ghostly.'

Presenter(s): Dillon Mahoney

The Language of Abortion: Gender, Race, Language Access, and New York City Clinics

Structural barriers (e.g., structural racism, sexism, economic barriers, anti-immigrant prejudice and policies, and language access issues) often limit access to adequate healthcare for Latina/o/e/x/Hispanic populations. Abortion care carries even more significant barriers to access due to political, cultural, and social challenges. Recent policy/legal changes such as the Dobbs decision and many states' policy actions to limit abortion access have exacerbated existing challenges and barriers to accessing this important form of care. One key factor in access to care is language, where the mismatch (or discordance) of language between provider and patient leads to lower quality of care and negative health outcomes. Although research has documented the broader disparities in health access related to language concordance and cultural-linguistic access in care, further research is needed to understand the experiences of Spanish-speaking Latina/o/e/x/Hispanic individuals seeking abortion care in the US. Recent ethnocentric and anti-im/migrant policies have accelerated the need for this work. Through the lenses of reproductive

justice and intersectionality, this project uses various ethnographic methods to understand the experiences of these populations in clinics in New York City. Preliminary observations from clinic visits and conversations with clinic personnel provide insights into the impact of language and policy changes on abortion access in these clinics.

Presenter(s): James Robbins

Navigating Anti-Diversity Legislation: University Instructor Experiences in Florida

This research explores how the history of education policy in Florida, the hegemonic struggle of the university, and the commodification of teaching and learning intersect to shape the academic identities and practices of instructors teaching under anti-diversity legislation, including critical race theory (CRT) and anti-diversity, equity, and inclusion (DEI) bans, among other restrictions. Drawing from a combination of participant observation, person-centered interviews, and auto-ethnography, this research specifically aims to investigate how instructors of various ranks and disciplines understand, experience, and navigate Florida Senate Bill (SB) 266 and related legislations at a large public university in Florida. This research builds on calls for ethnographic investigations within institutions of higher education by interrogating the concept of DEI in undergraduate student instruction (see, e.g., Yelvington et al. 2015). By employing an ethnographic approach, this research contributes to existing literature on the passing of CRT bans and anti-DEI legislation (see, e.g., Chun and Evans, 2024; Caradonna, 2024; Barsky et al., 2023; Caradonna, 2023; Groton et al., 2023; Russell-Brown, 2024; Schoorman and Gatens, 2023; Schoorman and Gatens, 2024) to elucidate the immediate social and pedagogical ramifications of SB 266 and other emerging anti-diversity legislations as they are passed and implemented at a large public university in Florida.

Presenter(s): Emma Abell-Selby

Specters of Defiance: The Potential of Micro-Policy Implementation

Multi-scalar conversations to understand the intersectional impacts of sweeping policy changes provide useful ways to mitigate the effects of systemic attacks on marginalized communities. While limited by the frameworks of wider, high-level policy, localized policy implementation provides potential avenues to counteract some of the detrimental impacts on targeted communities and individuals. Drawing particular attention to policies impacting LGBTQ+ communities, this paper examines the relationships of policies at different scales and how local policy implementation can act not only to magnify damage but also mitigate negative impacts. By examining how micro-level policies navigate broader policy language in localized ways, it highlights the shades of resistance to particularly harmful and marginalizing policies that are possible when macro-level policies are interpreted and enacted on a smaller scale.

Presenter(s): Dawn M. Rutecki

Fear and Deportation: How New Immigration Policies Affect Marginalized Immigrant Populations

Recent changes in immigration policy have led to sweeping and violent arrests of immigrants, sometimes despite their legal status in the United States. This violence leads to fear among immigrant communities, particularly in households with individuals with precarious immigration status. Further, this fear is also caused by forms of political and symbolic violence whereby violence is enacted through legal policies. I demonstrate that these policies resulting in mass deportations have a ripple effect of fear in immigrant communities. This paper explores the lived experiences of immigrants living in Central Florida, often with precarious immigration status, with such policies. These new immigration policies have spread fear throughout the community of deportation, causing stress and negative mental health outcomes. This is especially challenging for mixed-status family households where some family members have legal immigration documents and some do not. Newly enacted policies worsen the overall mental health and well-being of immigrant populations living in the United States based on the targeting of this population for deportation.

5099 Hearing the echoes across diaspora, transience, and signs: The intersections of history, place, memory, and legacies of authenticity

Start Date: 11/21/2025 8:30 AM **through** 11/21/2025 10:00 AM

Venue: Marriott **Room:** Galerie 4

Type: Roundtable/Town Hall

The notion of "authenticity" in speech communities has long been a contested feature of language revitalization enterprise (see Jones 1999 for Breton, Cotter 2001 for Irish, Jaffe 2013 for Corsican, etc.). This contestation is not new, but the discussion surrounding its facets bears revisiting. Meanwhile, ethnographic exploration of the tension between linguistic authenticity and a universality of use (characterized as anonymity) has produced insights into what Woolard and Frekko (2013) describe as "the late-modern phenomena of boundary dissolution, shifting scale, cosmopolitanism, and changing ideologies of authenticity and anonymity". At the same time, productive work on the notion of authenticity in the performance of identity invites us to return to Appadurai's (1996) notion of flows where "transnational flows have allowed for the restructuring of (imagined and physical) places and membership affiliations along multiple and more complex axes" (McEntee-Atalianis & Zappetini 2014).

Additionally, Eckert (2014: 52) utilizes the concept of "authenticative" moves to address variation as "a more robust and dynamic indexical system" than had been envisioned by Labov, for whom authenticity is bestowed on speech/speakers by the analyst (linguist). Woolard (2016) notes that within an ideological frame privileging speakers' judgement, authenticity "must be perceived as deeply rooted in social and geographic territory in order to have value" (p. 22). And yet a standard language ideology seems to produce forms which are untethered from place, e.g., a "language elsewhere" (Mena 2022) or a "nowhere Corsican" (Thiers 1993 as cited in Woolard 2016).

Combining these contexts, this Roundtable investigates what the circulation of signs (through language, communication, symbol) relies upon, questions, achieves or fails in the production of "authenticity" and legibly "authentic" identities. Recognizing the intersection between semiotics and an understanding of identity as praxis, whether understood as performativity or stance-taking, we seek to revisit the role of metapragmatic awareness as members of diasporic, transient, established, and/or immigrant communities negotiate the challenges of how communities speak about themselves, whether informed by linguistic insights or developed within the community, as well as the extent to which related disciplines reflect on their own implicit homogeneity and resistance to change as to what might constitute "authenticity". The signs deployed, where "legibility" varies, and how multifaceted and diverse viewpoints are contested or remain stable are questions that come into play.

Assuming that authenticity is a complex negotiation across and for different audiences, we examine how it is deployed by speakers – immigrant, transient, diasporic, and rooted; how identities are indexed; and what the relationship with performativity, authenticity, and, where applicable, indigeneity resides and how it is motivated, shifted, dissol

2555 Feminist Anthropology and Decolonial Practice in the Andes and Beyond: Discussing Florence Babb's Contributions and Impact

Start Date: 11/21/2025 8:30 AM **through** 11/21/2025 10:00 AM

Venue: Marriott **Room:** Galerie 5

Type: Roundtable/Town Hall

This is a multigenerational roundtable of scholars of the Andes and Latin America who will discuss Florence Babb's deep and wide-ranging influence on their research, teaching, and scholarly practice. A leading feminist anthropologist whose career spans over four decades, Babb has consistently pushed Andean and Latin Americanist debates in new directions, writing on topics ranging from the economic and family life of Peruvian marketwomen, the shifting political landscape of post-Sandinista Nicaragua, and the cultural politics of tourism in Latin American societies with recent histories of violence and revolution. A hallmark of Babb's trajectory as a researcher has been openness and curiosity in implementing innovative theoretical perspectives and methodological approaches. Her early research on Peru integrated feminist and Marxist anthropological traditions of the 1970s and 1980s to address debates about women's work and gender inequality in the Andes. In recent decades, Babb's scholarship has provided models and

insights for a reflexive and engaged ethnography as well as for anthropological interventions in areas such as critical development studies, queer theory, and decolonial feminism. Currently, she is working on a book project that examines gendered and racialized geographies in Peru, ethnographically documenting perceptions of difference and mobilities across three field sites (Vicos, Huaraz, and Lima).

In addition to her impact as a researcher, Babb's feminist and decolonial commitments have extended to her work as a teacher, mentor, and colleague. Her support for students and colleagues has included-but has certainly not been limited to-teaching and advising in positions at Colgate University, the University of Iowa, the University of Florida, and the University of North Carolina at Chapel Hill as well as leadership roles in the Association for Feminist Anthropology and the AAA Executive Board. She has offered sustained support to anthropologists across the globe, working closely with scholars of diverse nationalities, career stages, and institutional affiliations. A community builder in the best sense of the term, Babb's scholarly practice offers lessons for developing and sustaining an inclusive and engaged anthropology in uncertain times.

8469 Traces That Remain: Experimental Ethnography and the Poetics of Absence

Start Date: 11/21/2025 8:30 AM **through** 11/21/2025 10:00 AM

Venue: Marriott **Room:** Galerie 6

Type: Oral Presentation Session

This panel explores how experimental ethnographic practices engage with the ruin, the fragmentary, and the absent through the materiality of objects, the traces of memory, or the affective presence of the body. Bringing together works across visuals, sound, textiles, and performance, these papers investigate how loss, displacement, longing, and haunting manifest in form and feeling. Rather than treating absence as a void, these presentations engage it as a generative presence: a haptic trace, an ethical dilemma, a site of speculative repair.

Each presentation engages with forms that resist traditional ethnographic capture: quilts stitched with maternal memory, sediment jars and ephemeral soundscapes from climate-ruined coasts, ghostly long takes of Black urban abandonment on 16mm film, and ancestral echoes that render the Black body itself as a haunted site. These presentations demonstrate how aesthetic and experimental approaches-whether through craft, visuals, or sonic environments-can make visible

the spectral forces that shape everyday life. Across abandoned buildings, decaying textiles, disappearing ecosystems, and haunted bodies, the papers investigate how memory, loss, and presence persist—not through narrative resolution, but through sensory fragments, haunted objects, and spectral archives.

Rather than offering absence as lack, the panel reframes it as generative: a trace, a vibration, a haptic record. Across these varied sites and methods, the panel asks, how do traces—bodily, architectural, environmental—become ethnographic? What kinds of storytelling emerge through rupture, opacity, and aesthetic experimentation? And how might absence become a methodology—felt, inhabited, and composed?

Presentation(s): The Skein Her Very Skin: fieldnotes from the quilting bee

In post-industrial Manchester—once Cottonopolis—the architectural ruins of mills and smokestacks mark a bygone textile economy. Today, this landscape is threaded with small communities of women who gather in homes, church halls, and community centers to quilt. Quilts are everywhere—heirlooms stored in attics, folded in spare rooms, stitched into memory. Drawing on ethnographic fieldwork, I explore the intimate relationship between body and cloth through the lens of touch, engaging an anthropology of the senses. I reflect on how participation in the craft (techne) shapes knowledge (episteme) and how the running stitch acts as an indexical trace of the quilter's body—a form of self-narration in cloth. Comparing this tactile trace to the photographic punctum, I consider how both hold presence and absence, particularly maternal memory inscribed in baby clothes and family photos. I examine the therapeutic, absorbing quality of quilting and the enchantment of quilts as archives of life, skill, and loss. As a craft, quilting is episodic, folded, and faded—a fragmented practice that echoes the meander of life. I propose that anthropological inquiry into women's everyday experience is enriched by embracing this assemblage of partiality—offcuts from larger fabrics of time and narrative. I argue for a more poetic and patchworked form of writing: one that mirrors the quilt itself in its embrace of fragments, contradiction, and care.

Presenter(s): Lydia Donohue

Spectral Choreographies: The Haunted Body as Ethnographic Trace

This paper, grounded in experimental ethnographic practice, explores the haunted body as a site of memory, resistance, and aesthetic disruption. Through the collaborative film *Ripples in Still Water*, made with Eboni Edwards—a Black woman artist navigating the racialized gaze of predominantly white institutional spaces—the work investigates how the body carries spectral histories: ancestral voices, structural silences, and performative expectations.

Structured through fragmented vignettes, poetic voiceover, and nonlinear rhythm, the film treats performance as both method and message. The body becomes an archive of affective and

historical traces, articulating presence through absence and memory through gesture. Movement, voice, and abstraction function not only as representational tools but as ways of knowing: haptic inscriptions that resist legibility.

Framed by decolonial and feminist ethnographic approaches, this project embraces narrative rupture, opacity, and refusal—refusing to stabilize identity or resolve trauma. Instead, it invites viewers into a space of attunement, where fragmentation becomes a mode of care and witnessing.

In dialogue with material ruins, textile archives, and ecological absences explored by other panelists, this paper reflects on how experimental ethnography might reveal what lingers, what aches, and what resists being named—but still insists on being felt.

Presenter(s): NARMEEN IJAZ

Traces of Absence: Nonhuman Witnessing and Climate Storytelling Through Ruins and River Memory

This paper explores how ecological ruins and damaged landscapes in Bangladesh bear witness to elemental loss through nonhuman-centric storytelling. Engaging the aesthetics of absence and spectrality, I examine how water, soil, and silence act as agents of memory—foregrounding more-than-human forms of ecological witnessing. The paper proposes a "nonhuman archive" framework that reframes ruination not as emptiness but as a sensory, material trace of ongoing environmental histories. Two case studies ground this analysis. The first is the Community-Based Water Museum in Kuakata, Bangladesh, a participatory archive created by villagers, activists, and environmental educators in Bangladesh's climate-vulnerable coastal belt. The museum's collection—bottled water from vanishing rivers, sediment jars, boat songs, and oral myths—functions as a living archive of ecological disappearance, activating what I call an archive of absence. The second case engages Kamar Ahmad Simon's experimental documentary *Are You Listening!* (2011), which chronicles life in a flood-affected village through haptic cinematography, ambient textures, and sensory fragmentation. Together, these cases offer insight into how the elements—water, wind, and soil—mediate trauma and resilience in post-disaster contexts. Rather than frame climate ethnography as collection or explanation, this paper approaches it as attunement to fragments: to what remains, what has been submerged, and what resists legibility.

Presenter(s): AHMED TAHSIN SHAMS

Haunting and the Aesthetics of Absence in Christopher Harris's 2000 still/here

This paper examines artist-filmmaker Christopher Harris's 2000 experimental documentary *still/here* about his hometown of St. Louis, a city deeply associated with urban decline. The black-and-white feature-length film shot on 16 mm is mainly made up of long static and roving unpeopled takes of collapsing structures and blocks of boarded-up buildings and overgrown lots in predominantly African-American north St. Louis. The film's shots linger on the physical materials of these ruined edifices, juxtaposing them with turn-of-the-century architectural materials preserved in regional historical societies in interpolated scenes. Many shots are animated by disjointed

soundtracks of unanswered phones and doorbells, the looping voicemail message of the St. Louis Housing Authority, sounds of footsteps and construction, and other haunting non-diegetic sounds and voiceovers. By these means, the film brings attention to the ways that historical and social forces have shaped material objects and environments and also sets up a play between the materiality of 16 mm film and the film's themes, critical to much of Harris's work. Moving between presence and absence, Harris's film tells the story of the traces left by African-Americans in a Rust Belt city, of spaces they inhabited and continue to inhabit, and of palpable histories embedded within the built environment.

8602 The Spectral Landscape of the Womb: A Multimedia Art Installation

Start Date: 11/21/2025 8:30 AM **through** 11/21/2025 12:30 PM

Venue: Marriott **Room:** Jackson

Type: Installations

The Spectral Landscape of the Womb, curated by Lucila Carballo, is a multimedia art collection that gathers reproductive stories of Latinx immigrants living in shelters across New England. The works span experiences from pregnancy and birth to abortion and infant loss. Rooted in a borderland perspective that intertwines languages, territories, and temporalities, the pieces reveal the womb as an existential nexus — a space where life and death, trauma and pleasure, ancestors and unborn beings converge. This uterine limbo unfolds in three dimensions: geopolitical borders, intergenerational memories, and futuristic liberatory visions.

Featuring experimental film, mixed media collages, zines, soundscapes, and penumbral womb ambiance.

INSTALLATION COMPONENTS & DESIGN

At the heart of this exhibit is a 45-minute experimental film weaving together the testimonies of Latinx immigrant participants. Shot on Super 8 and 35mm, the film unfolds in six chapters, each a spectral loop evoking feelings and thoughts that resist articulation. Surrounding the film are six mixed-media collages and zines that compile poetry, prayers, dreams, and remedies. Together, these pieces reflect a process that unfolded over two years, revealing intimate and collective perspectives.

Over the course of 2023–2025, *The Spectral Landscape of the Womb* evolved at the intersection of art, anthropology, and reproductive justice. Beginning in May 2023, Lucila Carballo collaborated with participants as both full-spectrum doula and ethnographic researcher. In 2024, participants transformed their interview transcripts and audiovisual materials into multimedia narratives that trace the liminal passages of pregnancy and birth, border crossing and shelter life.

More than depicting ghosts (though some do appear), the exhibit evokes quotidian images revealing layered subjectivities, colliding temporalities, and paradoxical experiences at the thresholds of life.

Rooted in epistemologies that move through opacity and affect, these works embrace unknowing and contradiction without seeking resolution — attending to aspects of everyday experience often overlooked and creating a space where the spectral opens up possibilities of knowing and caring.

VISUAL ETHNOGRAPHER & INSTALLATION DESIGNER

Lucila Carballo is an Argentinian scholar, artist, and doula based in Western Massachusetts. She has an interdisciplinary background in medical anthropology, feminist theory, and experimental filmmaking. Her debut feature film, *Idalia and the Niño Santo*, won first prize at the Gender Lab during the Muestra Internacional de Cine con Perspectiva de Género (MICGénero) in Mexico City in 2018. Carballo is currently a Ph.D. candidate in Anthropology at UMass Amherst, where her dissertation research focuses on Latinx reproductive experiences in the U.S. Her work has been supported by the 2024 Wenner-Gren Foundation Dissertation Fieldwork Grant.

In addition to her academic work, she serves as a full-spectrum doula with the Abortion Rights Fund of Western Massachusetts. By integrating doula work, ethnography, and art, she creates immersive installations and experimental films that explore rich testimonios beyond trauma narratives grounded on ontologies of victimization. Her work emphasizes pleasure, care, and imaginative possibility, tracing how experiences of migration and reproduction unfold across the complexities of time and affect.

3253 'A specter is haunting anthropology': Ethnographic investigations of psychoanalysis across contemporary clinical, scientific and cultural landscapes

Start Date: 11/21/2025 8:30 AM **through** 11/21/2025 10:00 AM

Venue: Marriott **Room:** MGB - Salon B

Type: Oral Presentation Session

Since the 20th century, anthropology has thought with, against, or through psychoanalysis (Hollan 2022), as both disciplines emerged as the 'counter-sciences' of modernity (Foucault 1966). This long-held companionship led to strong forms of collaboration, disenchantment, and opposition. During the same time, psychoanalysis became a significant therapeutic and cultural product, influencing expert and lay publics, elite and pop cultures (Hale 1995), and disseminating well beyond the liberal, industrialized West (Pinto 2019, Oliveira 2005, Plotkin 2001). Curiously, despite their companionship (e.g. psychoanalytic anthropology, ethnopsychanalysis) and the place of psychoanalysis in modern culture, anthropology did not develop a cohesive research program about psychoanalysis as a sociocultural reality, unlike other disciplines (Plotkin 2017, Berger 1965) that even have their own specialized journals (e.g. *Psychoanalysis and History*).

Far from being a mere uninterested omission, this gap in the discipline is part of psychoanalysis' broader haunting existence within our anthropological landscape. Psychoanalysis is (one of) anthropology's ghost(s). With the decline of psychoanalytic therapy —mainly in the Global North—

anthropology's engagement also decreased (Crapanzano 2015). In the past 15 years, as global mental health revisited psychoanalysis (Jimenez 2023), a renewed anthropological interest rose (Rahimi 2021, Good 2011). This time, however, we aim to go beyond the well-established combination of anthropology and psychoanalysis to rather realign the reflectors of anthropological inquiry towards psychoanalysis itself, for its social life stands as an optimal gateway to unpack the contemporary.

The ethnographic investigations composing this panel –covering Latin American, North American, and European cases– place psychoanalysis at the center of their study. They explore psychoanalysis as a genre that connects forms of intimate and public listening; as a therapeutic practice with an ambivalent relationship with technoscience; as a tool to resist institutionalization and bio-reductionism; and as a contested discourse to address racial justice, health equity, and therapeutic pluralism. The intersections of these varied social worlds and geographies illuminate broader and complex global dynamics in which psychoanalysis is entangled.

This panel is a timely initiative that fits perfectly with the AAA's 2025 theme of Ghosts, for psychoanalysis has had an ambivalent absent presence within both anthropology –with numerous cycles of death, haunting, and rebirth– and contemporary culture, knowledge, and health (Leze 2017). The panel is also a step forward in building a more cohesive dialogue among anthropological scholars(hip) on psychoanalysis, whose work has remained constant (Brotherton 2020, Wolf-Meyer 2015, Schechter 2014) but dispersed, scattered across broader conversations in anthropology (e.g. Pandolfo 2018, Lakoff 2005, Luhrmann 2000).

Presentation(s): Memory and the Politics of Psychoanalysis in Brazil

Since the early 20th century in Brazil, psychoanalysis has unfolded as a plural, plastic, and paradoxical field—sometimes reproducing elitist forms of self-making while at others serving as a vital source of critical consciousness and resistance against state oppression. This presentation explores the complex role of psychoanalysis within the diverse memory practices that emerged after the dictatorship (1964–1984). Drawing on a longitudinal ethnographic study with participants of the 1982 birth cohort in Pelotas from ages 15 to their 40s (1997-2024), I demonstrate how psychoanalysis contributed to reproducing historic structures of dispossession, as expectations for Brazil's democratic future intersected with prevailing norms of "societal progress" and "psychosocial development." In this psychoanalytic ethos, only the erudite were generally deemed

capable of the biography "deep" memory work needed for the creation of an autonomous self, while learning how to forget became accepted as therapeutically valid for marginalized populations. Yet, eschewing both modalities, some of my interlocutors sought psychoanalytically infused clinical encounters that used memory practices and intergenerational place-making to disrupt norms of "development and progress" in ways that resonate in their lived to this day. I argue that this psychoanalytic modality is due, in part, to its cross-fertilization with Brazil's enduring traditions in critical pedagogy and collective health.

Presenter(s): Dominique Behague

"What if my mother finds out?": The circulation of psychoanalytic discourses in Buenos Aires' mass media

In this presentation I analyze the circulation of psychoanalytic discourses in Buenos Aires' media outlets from commercials, to talk shows, radio programs, and graphic humor, and highlight the intersection between expert knowledge and lay interpretations of psychoanalysis. Widespread exposure to psychoanalysis—by undergoing therapy, through personal connections, or media representations—has nurtured a large and active public within which people freely engage in psychoanalytic interpretations, often bringing these to bear on everyday interaction. Through these circulatory routes and modes of practical application, a vernacular psychoanalytic logic has been woven into the city's cultural and social fabric, as an explanatory model of both ordinary (e.g., casual use of a phrase or word, the ordering of two names) and extraordinary (e.g., a politician's campaign promises) behavior. Central to this phenomenon is the concept of communicability: the way in which discourses disseminate through ideological channels (Briggs & Hallin 2007). This notion can help us understand how text producers and disseminators are positioned relative to them, and how these various positions are not fixed but rather contextually refracted. I specifically analyze the figure of "the mother" that emerges through regular invocations of the Oedipus Complex, as well as depictions of mother-son relationships in advertisement and graphic humor that imply a particular, and largely negative, form of femininity.

Presenter(s): Xochitl Marsilli-Vargas

De-Oedipizing Heredity: Psychoanalysis, Kinship, and Neuromuscular Dystrophies at a Brazilian Genomic Clinic

Psychoanalysis has stood as a treatment that intervenes on disordered kinship relations inscribed in the psyche through the Oedipal complex. By the late 20th century, psychoanalysis' Oedipal narrative became problematic. Critics argued that rather than identifying pre-existing Oedipal forces, psychoanalysis enforced Oedipizing practices, forcibly fitting everything into a nuclear familial drama. In parallel, genomic medicine started identifying diseases caused by genetic mutations, many of which were intergenerationally inherited. The assimilation of kinship into genetic heredity became salient in families whose members were affected by (the risk of) genetic disorders. This presentation discusses the results of an ethnography conducted at a genomic clinic in Brazil, that established a collaboration with Lacanian psychoanalysts to jointly treat cases of

neuromuscular dystrophies (NDs). NDs (re)write family relations by naturalizing kinship as heredity, by reconfiguring forms of care, and by rewriting the limits of self and kin. I explore the reinvented functions of psychoanalysis in this landscape, as both disciplines draw from homonymous notions of family, kinship, and lineage. The biogenetic conscription of kinship produces new forms of familial misfortune and interrogation, now framed under the parameters of genomic medicine. In this new 'bio-Oedipized' scenario, psychoanalysts play a de-Oedipizing role, aiming to take suffering beyond the (genetic) familial drama.

Presenter(s): Rogelio Scott-Insua

'Tranq' as an Object of Non-Knowledge: Xylazine, Opioid Adulteration, and the Politics of Public Unconsciousness in Philadelphia

This paper draws upon fieldwork in Dublin, Ireland and Philadelphia, PA to explore the "problem" of public unconsciousness for community health and addiction medicine. Topically, it centers the rise of xylazine in the US drug supply, a veterinary tranquilizer and increasingly common opioid adulterant in Philadelphia. Though public health officials have issued urgent warnings about the chemical mélange called "tranq," largely advocating for harm reduction policies promoting low-barrier care and socioeconomic support, the spectacle of tranq use has inspired misinformation, political outrage, and widespread horror at the sight of users' semi-somnolent bodies, simultaneously cast by popular media as monstrous threats to public safety while also hovering at the threshold of sleep. To grapple with this aporia, this paper draws on two epistemological traditions within anthropology: the discourse of psychoanalysis and Science & Technology Studies. As moral panic overwhelms data-driven public health, it seeks to theorize an ethnographic approach to the foreclosure of medical knowledge and the proliferation of collective fantasy in times of clinical and political crisis. Further, drawing from the history of psychoanalytic anthropology, it interrogates the tension between shared symbols and the symptom (Obeyesekere 1990) to offer an "untimely" critique of bio-reductionism within the health fields (Pandolfo 2018). From the spectacle of sleeping bodies, a psychoanalytic specter emerges.

Presenter(s): Michael D'Arcy

A Psychoanalysis "Of Our Days"

Within contemporary discourse in a professional psychoanalysis located in New York City, a post-pandemic refrain emerges: "Of our days," and "Today." Lacan defines, in his Seminar III, perhaps not coincidentally on psychosis, a master signifier in this way: "Everything radiates out from and is organized around this signifier. It's the point of convergence that enables everything that happens in this discourse to be situated" (1993, p. 268). This paper discusses the place and the no place of psychoanalysis indexed by this signifier, established historically and in psychoanalysis's contemporary clinical and professional practices in the pandemic and post-pandemic. At the same time, the question of "our days," appears to point somewhere beyond psychoanalysis, which has historically, at least in its clinical forms in the American context, focused on the individual. While arguing that this focus results from an original assimilation in psychoanalysis of racial difference,

this paper considers the possibility that what one might call a "censorship" becomes less and less feasible as the field moves in response towards explanations of mass phenomena. I further suggest that developing the field of psychoanalytic anthropology into the space of "our days" (Hollan 2022), could benefit from theoretical tools offered by psychoanalysis that address conscious and unconscious life that emerges in response to a dislocating global context (Pandolfo 2018).

Presenter(s): Marisa Berwald

Discussion

7129 John Bowen through Discourse: Reflections on a Inspiring Career

Start Date: 11/21/2025 8:30 AM **through** 11/21/2025 10:00 AM

Venue: Marriott **Room:** MGB - Salon C

Type: Roundtable/Town Hall

In this roundtable, several former PhD students of John R. Bowen discuss the legacy and impact of his scholarship in honor of his recent retirement. Topics of discussion will reflect the many broad impacts of his research. We discuss the transformational legacy of Muslims through Discourse on the anthropological study of religion, with a look at how scholars have drawn from this ethnography in shaping not only their studies of Islam and Muslims in diverse contexts, but also many versions of Christianity, including Baptists in the Philippines and Mormons in Utah. We will consider the significance of Dr. Bowen's work in shaping the study of law and legal practice in Islamic contexts. Panelists also consider the impact of his research and teaching on the anthropology of institutions and, finally, his legacy in shaping pedagogy in the anthropology of religion, focusing on the significance of Religions in Practice and how this has shaped the teaching of the anthropology of religion.

Section: Society for the Anthropology of Religion

Discussant: Brian Howell, Wheaton College, Department of Sociology and Anthropology

1024 Framing Climate through Black Geographic Ancestral, Spiritual, and Religious Invocations

Start Date: 11/21/2025 8:30 AM **through** 11/21/2025 10:00 AM

Venue: Marriott **Room:** MGB Salon D

Type: Executive Oral Presentation Session

Efforts to address environmental degradation implemented through the expert-led management of

nature or top-down, market-based models of development impose complex social disasters upon Black communities, reproducing and recasting the logics of colonialism and racialized difference. Alongside the transformations these social disasters bring, Black communities are disproportionately impacted by unprecedented changes to the natural environment: Weather patterns are more unpredictable, sea levels are rising, and average temperatures are more variable. Still, Black communities' preoccupations with the ancestral, spiritual, and religious haunt the eco-modernist solutions that proliferate within today's context of global ecological deterioration. This panel gathers scholars across Black geographies to discuss the particularities and connections across regions within the context of ongoing entanglements of environmental, political, and socio-economic catastrophes. We invite panelists to contemplate how communities articulate environmental claims and contend with the ghosts of colonial modernity through ancestral, spiritual, and religious frameworks and/or ecological histories and philosophies. Panelists will address these questions: What are the desires and commitments that animate the ways African and Afro-diasporic communities make sense of and confront the metaphysical, socio-political, and biophysical flux that climate change brings? What do these desires and commitments suggest about Black ecological futures and their engagement with complex pasts? How do these futures reveal the adaptations that anthropological methodologies need to undertake to respond to ecological matters of concern within Black geographies?

Discussant: Lydia Gibson, Georgetown University

Presentation(s): The earth is a living thing: On Black Feminist Island Ecologies

As Lucille Clifton's poem *The Earth Is a Living Thing* so clearly articulates, the aliveness of the earth is inseparable from Black life. While not entirely refuting the narratives of the Anthropocene, Black feminist political ecologies allow for an understanding that there are continued and persistent acts of resistance/refusal that guide Black women's lives from within their present ecological conditions. Their acts towards futurity do not ignore the current ecological moment but continue to imagine living into the future. This paper will draw from narratives of ecological loss and disaster in the Sea Islands of coastal Georgia and the inevitable survival that exists in the interstices of climate catastrophe. This work focuses on the particular – the quotidian aspects of Black women's lives in the Sea Islands, an archipelagic space of the US South. These coastal geographies remain in precarity from sea level rise, saltwater intrusion, and coastal gentrification, but continued living despite threats of loss are a counternarrative to the environmental crisis and its foreclosures.

Presenter(s): Adrian Cato

Remaking Sacred Geographies: Spirits, Ghosts and God in Zimbabwe's Landscapes

This talk examines struggles over the meanings of and orientations to the sacred in Zimbabwe's landscapes in the context of the dispossession and theft of Black lands over the past two centuries. It focuses on Matobo, a region of dramatic mountains and balancing rocks that has long been the site of Zimbabwe's most important rain shrines and a burial place of chiefs and kings. The country's first mission station was established in the area in the mid-nineteenth century, and white missionaries played a pivotal role in laying the groundwork for the extraction of the country's mineral wealth and full-scale settler colonialism in the late nineteenth century. They also worked to deter Black people from engaging with landscape's materialities and nurturing longstanding relations with spirits that reside in it. These changes are part of longstanding racialized struggles over the meanings of the sacred under modernist religious and political orders in Zimbabwe, which worked to remake the landscape and transformed orientations to the sacrality of the area's mountains, rivers, and pools. This paper analyzes these histories through the lens of literature in Black geographies, approaching the landscape as a locus for interlocking material, spiritual, and political struggles. The paper argues that colonial efforts to remake landscapes and transform religion in Zimbabwe were two sides of the same coin, crosscutting discursive and material boundaries.

Presenter(s): Raffaella Taylor-Seymour

“We are an island of praying people”: Invocations of prayer, protection, and ancestral belonging on inundated Black landscapes

In the South Carolina Lowcountry—where the ghosts of chattel slavery haunt material landscapes through racial capitalism—climate change and gentrification are accelerating Black land dispossession. These dual forces of dispossession are especially harmful to Gullah/Geechee descendants of rural Sea Island communities, where traditions of land inheritance and sustainable stewardship have preserved culture and collective memory since Emancipation. As descendants fight to protect these relationships amid rising sea levels, property taxes, and predatory development, religious and ancestral spiritual traditions serve as vital practices of resistance. In this presentation, I examine how Sea Island descendants employ spiritual invocation to disrupt structural processes of land dispossession and reroot familial and communal ties to sacred landscapes. Drawing on two years of engaged ethnographic research in the South Carolina Lowcountry and interdisciplinary frameworks in Black Geographies and Ecologies, I illustrate how descendants articulate and embody environmental claims through spiritual invocations. Ultimately, I argue that examining how metaphysical summonings counter biophysical inundation in land and climate justice initiatives provides critical insight into how people negotiate power, agency, and belonging on rapidly changing landscapes.

Presenter(s): Pasama Cole-Kweli

Afro-Religious Eco-politics: Centering the Spiritual within Brazil's Climate Developments

In this presentation, I bring attention to the Brazilian Atlantic Forests in the city of Salvador, where Candomblé practitioners conduct rituals, honoring more-than-human spiritual entities that dwell in

rivers, waterfalls, rocks, and other biophysical elements. Candomblé itself is a religion that has its roots with descendants of enslaved African and Indigenous peoples, and its practitioners claim ancestral origins to Salvador's forests dating back to Brazil's slavery era. While practitioners make these forest ecosystems sacred, thus preserving them, the forests are vital not only to Candomblé. At the same time, they are locales in which the Brazilian state carries out conservation processes amid efforts to facilitate carbon sequestration and transform Salvador into a global climate city. I show that Candomblé creates distinct standpoints and grounds from which practitioners encounter and negotiate Salvador's environmental projects. Motivated by M Jacqui Alexander, who teaches how the "spiritual is political," I consider the spiritual, made evident through Candomblé rituals, as a continued praxis of Black sovereignty and ontological determination in these times of pronounced ecological transformations and decay. Through analyses wrought from practitioners' relationalities with spiritual entities, my ethnographic work allows us to rethink notions of incommensurability between the post-human turn and Black histories and worldmaking practices.

7048 In Memory of Development: Orienting Ethnographies of Climate Adaptation and Energy Transition Infrastructure in Anthropology (part 1 of 2)

Start Date: 11/21/2025 8:30 AM **through** 11/21/2025 10:00 AM

Venue: Marriott **Room:** MGB Salon E

Type: Oral Presentation Session

Climate change is indisputably a pressing and urgent crisis requiring both political and material planning to achieve meaningful mitigation. Large scale engineering and infrastructural projects have emerged as a predominant strategy by which national and regional economies anticipate the looming dangers of climate change. Proponents of such major construction endeavors argue that they will bring benefits far beyond their technical functions of supplying renewable energy, storing captured carbon or holding back ocean water. Inclusive prosperity, economic justice, and societal beneficence are just a few of the key moral discourses for justifying massive public expenditures in new technological and environmental infrastructure across the globe.

In light of the urgency of climate change adaptation strategies, a growing body of anthropological scholarship has rightly set about examining the societal and ecological impacts of these immense investments in climate mitigation (Boyer 2019; Cross and Neumark 2021; Vaughn 2017). This panel responds to emerging patterns across this literature finding injustice, expropriation and exploitation in green transition projects (Argenti and Knight 2015; Schwartz 2024). Consequently, we open a dialogue about the barbed complexities of responding to climate change at an adequate scale without these urgencies eclipsing either a necessary skepticism of industrial interests or the multidimensional costs of adaptive intervention.

Disquietingly, visions of a just green transition resemble the promises of society-wide improvement in conditions of human life promised by the development agendas of the latter half of 20th century (Li 2007; Duncan 2004; Scott 1998). Beyond promises, the political economy of green technology iterates on colonial patterns wherein technologies developed for the global north are transposed to former colonies, extracting profit from global south national funds and natural resources. Nevertheless, the 21st century's climate adaptation and energy transition infrastructure projects, as they evoke re-emergent dreams of technologically facilitated affluence, rarely confront or incorporate social knowledge of development's prior failures: environmental destruction, expulsion of indigenous people, forcible embedding in capitalist exploitation, elite empowerment, and dependency economics.

To begin unpacking the scholarly dilemmas of green transition agendas, this panel seeks to explore how the planning imperatives and expansive, pro-social promises of climate change mitigation are balanced against social and theoretical knowledge of expected limits. We will consider how anthropological scholarship and ethnographic commitment can engage constructively with the challenges of adapting to climate change without erasing or obscuring its discontents.

Presentation(s): Promising Green Growth: Development in Namibia; Decarbonization for the World

Namibia's story reflects its recent emergence from apartheid's lingering social structures of segregation. After Independence, economic development was driven by increasing exports of minerals and agricultural commodities. While this increased incomes per capita, it also reproduced and exacerbated socioeconomic inequality. After a global commodity crisis and COVID-19, growth and development in Namibia has stalled. Still, the government of Namibia periodically produces development plans that promise "shared prosperity through inclusive growth."

Namibia recently discovered a new source of potential development, one that also could help the rest of the world. Namibia has vast potential for generating renewable energy and green hydrogen, thus attracting large investment flows into mega-projects. This green fuel could decarbonize carbon-intensive industries throughout the world. The country's development goals are now intimately entangled with global decarbonization efforts. If Namibia can become a leading global producer of green hydrogen, then it can both secure the future prosperity of its growing population and curtail carbon emissions. I chart governmental narratives of "development through decarbonization" in the context of Namibia's bet on "green growth." I analyze the narrative strategies of making hope against the materiality of manufacturing commodities for export to the Global North. In this tension, how will Namibians "live out" or "live out of" these changes?

Presenter(s): Nikita Taniparti

Selling Fast Air – “Wind Resources” and the Post-Colonial Frontiers of Climate Capital

The seemingly innocuous term 'wind resources' emerged along with commercially-viable wind energy in 1970s corporate agendas and corresponding regulations. As used in the new US Federal Energy Regulatory Commission regulations of the late 1970s, the term as a cipher for imposing resource logics onto phenomena hitherto outside of economic management. Systematically entering official documents, research papers and corporate communication, 'wind resources' grows wildly in use into the 2010s.

From this origin, I follow the movement of wind technologies from their corporate centers in Scandinavia to energy planners in Southeast Asia. Drawing on extensive fieldwork among energy planners in ASEAN, I show how wind energy companies export off-shore wind-mill solutions to the global south, invoking narratives of green growth modelled on 20th century developmentalist visions. This in turn drives the production of new 'wind-resource' maps of Southeast Asia.

Thus, wind is transmuted from atmospheric condition to a potential material and economic asset, which owing to the urgency of climate change, should be exploited fully. I conclude that 'wind resources' is a vehicle for expanding frontiers of capital across post-colonial geographies and that iterating on development narratives to promise future prosperity supports the entrenchment of post-colonial dependency economics under the banner of climate adaption.

Presenter(s): Asmus Rungby

Grids of Disconnection: Solar Energy and National Electrification Projects in Bangladesh

My paper examines the awkward relationship between energy transition and climate adaptation in solar energy in Bangladesh. Bangladesh once had one of the world's largest off-grid solar energy network: from 2002-2018, state and development organizations distributed millions of solar home systems, providing electricity access for around 20 million people (Cabraal et al. 2021). Since 2018, the now-deposed Awami League government rapidly expanded national grid connections, ultimately claiming 100% electrification in 2022 and purportedly rendering off-grid solar energy obsolete. Still, citizens complain over unreliable electricity and the endurance of solar home systems. My paper draws on 15 months of fieldwork among Bangladeshi state electricity workers, technicians and solar home consumers to analyze the fraught pursuit of national electrification and energy transition. Given how climate change disturbs technocratic projections for the future, climate adaptation is a fundamentally imaginative process of producing visions of the future. In the afterlife of off-grid solar, I examine contradictions between government-imposed ideals of Sonar Bangla (Golden Bengal) futures based on industrial and infrastructural growth, and alternative ideals of prosperity rooted in food, land, and biological diversity. Electrical infrastructure projects—as one of few remaining public and nationally integrated services in Bangladesh—mediate these conflicting ideals of national development.

Presenter(s): Dana McLachlin

Planning Sustainable Transitions. Community Energy Development in France and Romania

Energiewende made Germany a renewable energy front-runner, and a model for sustainable energy policy among European states. Judging by scale, the global transitions inspired by Energiewende are reminiscent of major energy infrastructure planning, but, unlike the state centered electrification campaigns of the 20th century, they leave the door open both for corporate takeover and for encouraging bottom-up alternatives. This paper explores community energy, understood as a fast-growing global movement that puts community initiatives at the heart of the fight against the capitalist, fossil fuel-based energy system. Community energy works as a planning framework for citizen-led renewable energy projects. I explore two developing energy cooperatives in France and Romania in which Energiewende principles were transmitted through policy and financial incentives. In France, the dominant disposition of nuclear power is counteracted by militant community energy projects developed by environmentally conscious middle-class citizens. Meanwhile, the coal and gas reliant infrastructure in Romania offers little room for a post socialist precarious entrepreneurial class to develop community projects mirroring German standards. The two cases portray how the community energy framework can lead to different forms of planning for sustainable transitions in the energy sector, each embodying contradictions, tensions, and conflicts that reveal the unequal and uneven nature of EU development.

Presenter(s): Roxana Bucata

Unearthing Rhetorical Legacies of Modernity: the Case of Offshore Wind Port Planning in Sears Island, Maine

The state of Maine has positioned Sears Island, a forested 941-acre island near Penobscot Bay, as a solution to regional economic decline following the collapse of key industries in the 1960s. In 2024, Sears Island was identified as the preferred site for the nation's first offshore wind port, generating considerable debate that echoes earlier contestations over development proposals for the island—including an industrial park (1969), a nuclear power plant (1974), and a container port (1980s). In this latest iteration, the state continues to promise economic revitalization while promoting Maine's technological ingenuity and commitment to clean energy. However, this language fails to recognize the incommensurable ideological interests of this debate and obscures the modernist logic that equates progress with development.

Drawing on historical archives from four major Maine newspapers, I examine which frames are mobilized, and by whom, in coverage of Sears Island over time. As with previous proposals, the core conflict remains a values-based struggle between conservation and development, and official narratives consistently marginalize community-driven visions for the island. By analyzing how these discourses shape public understanding and narrow possible futures, this paper argues that infrastructure projects are never mere technical or economic interventions, but political ones—structured by historical precedent and contested meanings of progress, place, and power.

Discussion

2872 Complicating Care: Exploring the Messiness of Caring Relations

Start Date: 11/21/2025 8:30 AM **through** 11/21/2025 10:00 AM

Venue: Marriott **Room:** Regent

Type: Roundtable/Town Hall

Within literature on health and rehabilitation, care is often rendered as positive, familial, life-sustaining acts (Thelen 2015) despite the fact that care can inspire resentment and extreme overwork, inflict violence (García 2016), and sustain systems of power (Stevenson 2014). As Maria Puig de la Bellacasa writes, classical feminist scholarship defines care as "anything done to maintain, continue and repair our world so that we can live in it as well as possible" (Tronto 1993). However, she pushes us to question what it means to "maintain" the structural violence that characterizes our world (Puig de la Bellacasa, 2017). This roundtable brings together medical anthropologists to interrogate care as a dialectical interplay between contradictory interpersonal and institutional relationships. Care can construct alternative imaginaries of collectivity and survival while also demanding a denunciation of the unjust social conditions that make interpersonal relationships of care necessary and shape the ways they unfold. Care can also cause harm towards the purpose of repair, inspire distance rather than intimacy, and impress abuse alongside love. In this discussion, we will explore the underbelly of care, thinking through the undertheorized perspectives of care-receivers, the ethically complex intentions of caring acts, and the state of care under neoliberal precaritization of social systems that shifts the responsibility for care onto families or renders care unrecognizable. We will discuss how our field sites, which range across institutional sites of community health around the world, have underscored how organizational and interpersonal provisions of care can coexist with, compose, resist, or obscure forms of neglect or refusal. Ultimately, we will aim to envision potential frameworks that better address the complexity of the care we witness, give, or receive by asking: How might attending to care practices in different ethnographic settings open up new ways of theorizing care? And how can we both affirm the centrality of care and attend to its inherent tensions and ambiguities, remaining in its messy potentials without turning to the comfort of definitive romanticization or critique (Puig de la Bellacasa, 2017)?

8716 Sonic Anthropology Radio - Ghosts in the Ether: A Hauntology

Start Date: 11/21/2025 8:30 AM **through** 11/21/2025 6:00 PM

Venue: Marriott

Type: Installations

Find us at the Marriott, second floor by the windows in front of Galerie 2, all day Friday and Saturday!

Sonic Anthropology Radio is a live-streaming pop-up radio station and online audio archive curated and produced by Tom Miller. Previous installments were presented at the AAA annual meetings in 2023 ("Toronto Mix") and 2024 ("Performance & Democracy"). Other editions have popped up elsewhere including the Society for Ethnomusicology Sounding Board in Austin, the North American Short Wave Listeners Association in Philadelphia, WGXC-FM Wave Farm Radio in New York State's Hudson Valley and WFMU worldwide.

In keeping with the theme of the 2025 AAA annual meeting, this year's proposed installation is 'Ghosts in the Ether: A Hauntology' - a participatory Internet radio station, livestreaming from the meeting site in New Orleans. Programs will include onsite interviews with AAA attendees, live readings, performances, remixes, sound documentaries and music. The broadcast will be archived on the Sonic Anthropology Radio website for future on-demand listening, free downloads and creative remixes.

Planned episodes and works already in progress include

Archive Fever: Ghost Stories - Wax-cylinder voices of the past from the world's oldest ethnographic sound archives, remixed and reimagined.

New Orleans Music Archives - Oral histories on New Orleans music history from the Special Collections archives at Tulane University.

Radio & Decolonization - Case studies by interdisciplinary scholars from the 2020-2024 project on Radio & Decolonization that was organized at the University of Denver and sponsored by the National Endowment for the Humanities.

Dr. John's Gris-Gris - Mac Rebennack speaks: previously unheard and unpublished interviews with the renowned late New Orleans pianist, singer, songwriter and Hoodoo man.

Je me souviens - An excursion through the common roots and divergent branches of Cajun and Acadian fiddle music from Québec to Louisiana.

Open Call - Live interviews with AAA attendees, and selections from their field recordings.

Activists of the Airwaves - Focus on community radio stations around the world.

This is Zambia Calling - Floating waves on the Zambezi River, from colonial radio to the 21st-century African mediascape.

The Haunted Forest - Field recordings of Siberian shamans from the last Soviet generation.

Spectral Wars - Historic shortwave broadcasts captured from past conflict zones and occupied territories: spy signals, official propaganda and clandestine messages sent to freedom fighters.

Radio Garden Roulette - Worldwide live radio sampling and interactive broadcast games.

Archived audio programs and information from past AAA Sonic Anthropology Radio installations can be accessed here:

2778 There is a House: Untimely Dwellings

Start Date: 11/21/2025 8:30 AM **through** 11/21/2025 10:00 AM

Venue: Marriott **Room:** Studio 10

Type: Oral Presentation Session

THERE IS A HOUSE invites reflections on ghostly dwellings. Houses are anchors of social relationships and forms of life, but can also be out of joint and, as such, unassimilable into the prevailing lexicon of culture and politics. They are concrete units with inside and outside, back and front, split and leveled, that shape and are shaped by relations of partition and containment. But they are also material indexes that refer beyond themselves by engaging other signifiers such as speculative finance, war, conceptions of heritage, of the sacred, of domesticity, or nature, and that anchor the house in one way or another. The house that there is can be still standing or in a state of abandonment, renovation and addition, destruction, or ruin, as in Benjamin's oppressive rubble of history, and, as such, produce a disjuncture in time and space and occasion reflection on the limits of obliteration and conventional ways of seeing. Sketches and biographies of houses might bring forth architectural planning, social relationships, political worlds, forms of life, as well as death. Participants might reflect on these relations and forms or the forces of enclosure and destruction—such as liberal and neoliberal vocabularies, settler colonial states, or climate change encroachments—that surround them. Houses built anew involve some form of erasure of what came

before, or testimonies to what remains, in ways that make archaeological excavations open-ended narratives into and about ancestrality. A house that there is might probe the status quo, which, to paraphrase August Strindberg, is where the real catastrophe lives, or, alternatively, highlight the untimely character of the dwelling for concepts and images of a future yet unknown. This panel will bring into conversation various angles whose common focus is the house. Acknowledging the classic place such an object occupies in anthropological theory, we propose to explore new iterations of, not just a house, but adverbially activated housings that are both experientially felt and analytically examined from within a variety of perspectives.

Presentation(s): The Part That Has Two Parts

What happens when the house is overwhelmed by welcome and unwelcome residents, when it is suffocated by competing claims of belonging, and when it becomes uninhabitable precisely because it is overcrowded with dwellers? I take my title from a concept of the political proposed by Jacques Rancière, reworking it with a radical twist. For Rancière, those who inhabit such unintelligible and anonymous modes of living are privileged subjects of politics, as they have the potential to render visible the partiality of the system. I am preoccupied with the opposite problem—with positions, places, and temporalities marked by an excess of legibility, where they are overcounted, over included, and simultaneously claimed by many. I ask how one's house takes shape and becomes overtly legible when it is governed by more than one sovereign state. Ever since the defeat of 1967, the occupied Golan Heights has been one of the most critical symbols of sovereignty in modern Syria. However, in the past decade, this very landscape has emerged as an urgent site to the conceptual understanding of the settler-national project across historic Palestine. Reflecting from the Golan Heights, a political space which resides neither inside nor outside one framework but is saturated by both. I illustrate what might be called "the part that has two parts," offering a reminder of how a single landscape can emerge as a site that is also internal to multiple political orders and regimes of duration.

Presenter(s): Aamer Ibraheem

Ghostly Dwellings as Political Indices

This presentation tells the story of a house in Kermanshah, a predominantly Kurdish city in Western Iran on the Iraqi border, to highlight the gap between political history and the experience of revolutionary Iran, and to reflect on the limits of contemporary politics of origin and place. Drawing on familial memories, narratives, and images, including my own, I highlight three historical-political

moments in the house's story: the mid-twentieth century, when the house served as one of the last vestiges of an urban way of life centered around the bazaar economy and land ownership; the 1979 Revolution and the Iran-Iraq War (1980-88), when, at a time of ethnic and religious sectarianism and geopolitical violence, the house served as a hub for the distribution of medicine in the region and as a hiding place for a leftist revolutionary on the run from the government; and the present, where the uninhabitable house sits disjointedly next to apartment buildings and much newer constructions, serving as an index of an unresolved past. I reflect on how the house animates political and moral emotions, enables discourse, and demands interpretations. Following David Scott and Talal Asad, I suggest that the house fosters a tragic political orientation marked by humility and responsibility.

Presenter(s): Milad Odabaei

An implausible beseechment: when the disappeared can hear you whisper

The concept of visitation in Islamic practice, ziyaret, is a periodic journey seeking beseechment from a buried body, out in the city, with the items representing this figure located in the domestic space as photographs or relics. Ziyaret are a way to maintain the public locatability of the dead and create personal routes/roots to them from individual points of departure [Ghazzālī 1989]. The visitation is a suture that maintains the privacy of the home with a web of relations that exist out in the world, characterized by different forms of speech. In March of 2013, armed men ideologically opposed to this religious practice set out to destroy the tomb of Sidi Andulsi in Tajoura, Libya and yet found the body of the saint had been disappeared. In a series of visits with members of my family who held personal connection to this site, knowledge of a re-burial was narrated to us. The body was placed in the backyard of the private home of one of Sidi Andulsi's followers, with its location known only to an inner circle to protect it from further violence. In describing the co-habitation of this devout family with the saint, whose daily life was interrupted due to the immediate proximity, I will highlight the catastrophe of disappearance as it impacts personal and political life in Libya. This paper questions the role that spiritual authority has, in its emergence from the desaturation of state power and necessity for personal attachments in undertaking such fieldwork.

Presenter(s): Moad Musbahi

The Rubble of Gaza

This presentation reflects on the affective power of the rubble of Gaza, and in particular its capacity to affect the Palestinian people who engage daily with its materiality and also its capacity to affect those of us who are disturbed by that rubble from the distance. Based on first-hand accounts shared on social media by Palestinians and journalistic pieces, I describe, first, how the rubble in Gaza has become the most potent symbol of the genocidal levels of destruction unleashed on Palestine by Israel. This is therefore rubble haunted by the ghostly presence of the more than 60,000 dead, most of whom died crushed by the rubble of bombed out buildings and remain buried there. Yet I also describe how people in Gaza have engaged positively and creatively with the rubble

of their cities: for instance, men using it as construction material to rebuild homes, children appropriating it as playgrounds, or artists using it to create public art that highlight Palestinian steadfastness. These engagements do not negate the pain and the ghosts evoked by the rubble but reminds us that subaltern people worldwide often draw on rubble to rebuild disrupted worlds and envision alternative futures.

Presenter(s): Gaston Gordillo

Domicide and the Ruination of Form

Among the Syrian regime's repertoire of techniques of dispossession and extermination lay what some have called "domicide": the destruction of home (Azzouz 2023). My displaced interlocutors showed me, over and over, images and video footage of ghost cities: East Aleppo, Ghouta, Idlib, and Homs reduced to rubble, slabs of concrete and twisted rebar, their names become emblems of ruin (kharab). A world gone flat. Other scholars have examined how sites of displacement from home then turn into spaces of resilience, as refugee camps and tent settlements transform "from shelters to dwellings" (Dalal 2022). I myself have argued that Zaatari Refugee Camp in north Jordan became, through the sharia studies of some of my interlocutors, a site of sustenance and passage (Iqbal 2025). Here, however, I follow an attempted return to home: a reluctant revolutionary, who long ached to return to Syria, was finally able to do so in early 2025. This paper outlines his futile effort to inhabit his ruined house, prompting a reflection on what Yassin al-Haj Saleh (2021) calls the ruination of form in the destruction of Syria—a ruination that touches both bodies and buildings, leaving them unrecognizable: examples from a parallel, hellish world, that is also our own.

2406 Engaged Anthropology: Illuminating the Crevices of Urban Inequalities

Start Date: 11/21/2025 8:30 AM **through** 11/21/2025 10:00 AM

Venue: Marriott **Room:** Studio 2

Type: Oral Presentation Session

Engaged anthropology is uniquely positioned to expose the hidden forces that obscure the material and immaterial impact of social and structural inequalities in contemporary societies. Further, engaged research emphasizes ethical accountability, relevance, collaboration and specificity to contribute to change in local contexts. As illustrated by Laura Nader, by asking questions up, down and sideways, anthropologists are astute at interrogating power. Engaged anthropological praxis is highly relevant in the context of Memphis, a majority Black city in a red state, where the legacies of redlining and other race-based policies continue to be visible in spatial and built environments as well as in resource distribution. Such inequitable living conditions have led to environmental injustices and uneven development in the most vulnerable areas of the city. Despite the city's reputation as a center for medical research and care, health outcomes in Memphis are highly

unequal from birth to death. In the crevices between the failures of the local, regional, and national governments to respond in meaningful ways to these conditions, numerous nonprofit and grassroots organizations are attempting creative, and sometimes subversive, strategies to build solidarity, make visible inequitable policies and practices, and push for systemic change.

Papers in this session highlight anthropological research conducted with and by the next generation of engaged anthropologists in Memphis. They collectively explore how Memphis and other places are shaped by local, regional and national forces, both visible and invisible. What are the relationships of power that shape urban and healthcare landscapes? What features are unique to the Memphis context? How do grassroots organizations, nonprofits and other members of civil society work towards ethical, collaborative and transformative practices to build the kinds of communities they want to live in? As Memphis residents, how can anthropologists best collaborate in efforts to make systemic change?

The individual papers take up themes of authenticity and equity of heritage tourism, question the meanings and practices of inclusive philanthropy, examine the relationship between space, emotion, and masculinity, explore structural barriers to cancer treatment, interrogate the ways nonprofit ideologies shape organizational partnerships, and trace the environmental risks of development on the city's drinking water. While diverse in theoretical orientation and subject matter, they all share an attention to the ways cities are shaped by and shape unequal social relationships, the dynamics within and between nonprofit organizations, and the possibilities for social transformation. Finally, this session asks participants to critically consider the role of engaged anthropology in confronting systemic inequities, amplifying silenced voices, and shaping futures of our communities and the discipline.

Presentation(s): "That Memphis Sound": Tourism, Authenticity, and Complexity in Memphis Music Venues

The concept of a "music city" is an emerging designation used in Urban Studies, urban planning, and community development to discuss cities where music is foundational to the city's cultural identity and contributes to the city beyond the music industry. Cultural heritage tourism, whether historic or contemporary musical tradition, is one such contribution. In places like Memphis, known as the home of the Blues, Soul, and Rock and Roll, musical legacies bring visitors from

around the world. Yet, the well-known narratives of B.B. King, Elvis, and Beale Street obscure the multi-layered dynamics of the local music ecosystem. This paper considers venues as a key site for exploring a complexity model of authenticity and interrogates the way music cities use their cultural heritage as capital and the challenges therein. Drawing on interviews with independent venue operators and participant observation at shows in midtown Memphis, my analysis suggests that authenticity, legacy, and equity are central to how venue operators assert their contributions to the music ecosystem. I argue that they negotiate negative authenticity (stigmatized behaviors present in a tourist location) through specific forms of cultural and social capital, like intentionally creating music spaces for residents and build community, to generate the economic capital necessary to survive. I conclude by pointing to the importance of interrogating the complexity of authenticity to increase equity in music cities.

Presenter(s): Caroline Warner

YOUTH, AGENCY, AND IMPACT: AN ANTHROPOLOGICAL PERSPECTIVE ON PHILANTHROPY AND YOUTH-LED SOCIAL INNOVATION IN THE GLOBAL SOUTH

As the world continues to experience increasing levels of global inequalities, young people, who have often been seen as mere recipients of developmental policies and projects, are emerging as agents of social transformation. Taking as its point of departure the inclusive philanthropic practices of Peace First, a nonprofit organization that supports youth-initiated innovation in 166 countries, this paper asks, how do young change-makers navigate systemic barriers and leverage available resources to drive transformation? Drawing on ethnographic insights, semi-structured interviews, and questionnaires, this paper traces the change-making journeys of young social innovators in the global South. By highlighting the agency of young grant recipients, I explore how historical inequities continue to influence contemporary philanthropic practices and explore the potential for participatory grantmaking to create pathways for systemic transformation. My analysis suggests that while young innovators' use of strategies like storytelling, peer mentorship, and localized innovation to overcome systemic obstacles and create impact that outlives the grant cycle, past inequities continue to express themselves in current funding practices. Ultimately, this paper suggests that philanthropic institutions must move beyond assumptions of impact and towards a more collaborative and reflexive model of support; one that both funds young grassroots changemakers AND actively learns from and with them.

Presenter(s): Olatomiwa Olusesi

The Impact of Ideologies on Memphis Nonprofits

While typically overlooked, prevailing ideologies guide and shape the work of nonprofit organizations. Understanding the relationship between these ideologies and the ontology of a nonprofit can help explain organizational practices, perceptions, and impact. Altogether, these dynamics produce ripple effects that extend beyond any single organization, shaping the realities of the personnel they employ, the communities they aim to serve, and even other organizations. This paper explores the impact of ideologies on a heterogeneous group of organizations conducting and

supporting community development and human service work in Memphis, Tennessee. Their organizational positionalities are arrayed along a vertical slice, ranging from local grassroots and community-based organizations to philanthropy and a large-scale thinktank. My analysis draws on semi-structured interviews with representatives from each organization. It examines the relationships between the foundational ideologies articulated within each organization—by both the institution and its personnel—and routine operating paradigms. My work highlights meaningful convergences and divergences that are rooted in subtly differing worldviews and contributes to nuanced understanding of the interplay between individual assumptions, ideologies, organizational practice, perception, and impact.

Presenter(s): Samson Mobashar

Protecting Memphis' Water: The Hidden Threats to the Memphis Sand Aquifer

The Memphis Sand Aquifer represents a vital source of fresh, clean drinking water for the City of Memphis, yet its sustainability faces significant threats from rapid urban development and inadequate transparency. Recent developments such as Blue Oval City and XAI have intensified concerns about the aquifer's structural integrity and water quality. This paper explores the complex dynamics between industrial expansion and public health, focusing on the network of agencies, including the Memphis Health Department, MLGW, and the Tennessee Department of Environment and Conservation, as well as private corporations involved in aquifer extraction. Despite their critical roles in managing and protecting this resource, these stakeholders often operate behind the scenes with limited public oversight or community engagement. I examine how current monitoring practices and regulatory frameworks obscure the impact of their decisions and perpetuate risks, particularly for adjacent marginalized communities that have historically carried the burden of environmental injustices. Analyzing both publicly documents and data that remains largely unseen, this paper begins to unearth the cumulative impacts of industrial activities on aquifer sustainability, and how insufficient water quality data and corporate influence on policy contribute to public distrust. I argue for stronger regulatory mechanisms, increased community input and ethical responsibility to protect Memphis' essential water supply.

Presenter(s): Jordan Spuryer

Products of Our Environment: How Ethnographic Methods Can be used by Young Black Men to Understand their Emotions as a Practice

Situated in the largest majority black city in the United States, Memphis, TN, this paper draws on a study of the relationship of physical space and the practice of emotion among young black men. Conducted in collaboration with Helping Inspire Men (HIM), a Memphis-based nonprofit that employs culturally relevant practices to foster conversations among black men designed to provide black men with tools to better understand their emotions, this engages young black men in ethnographic mapping and autoethnography to trace sites of discipline and emotional expressions. Following Allen et.al's assertion that "black masculinities might be understood to be a collection of practices constructed through social anxiety and fear of black men...mediated through particular

hegemonic, discursive, and repressive practices" (2019, 20), I explore what practices young black men use to understand their emotions, how these emotions are interpreted, and how this may manifest depending on their environments. I argue that emotional practices are formed by specific social settings and power relations that enable and/or disable young black men to be able to name, mobilize, communicate, and regulate their emotions according to their environment. I conclude by considering how ethnographic tools might serve as a personal resource for individuals situated in systems of power to understand how their emotions and lived experiences are impacted by their environment.

Presenter(s): Trinity Chism

An Anthropological View of Biomedical Enactments of Cancer in Memphis, Tennessee

The domain of biomedicine has controlled the diagnosis, management, and treatment of cancer for over a century, directly interacting with and creating the patient's subjective experiences of cancer. Almost all cancer treatments intersect with biomedical practices, procedures, and knowledge, which incorporate definitions of illness and disease within the physical body, leaving social realities of health and disease unexamined. The intensive physical and social interactions in the biomedical model of cancer actively contribute to the subjective experience of patients knowing their bodies with cancer. Drawing from research at a cancer center in Memphis, I examine the ways that biomedical practices and discourses enact cancer, bringing it into reality and influencing how cancer is felt, known, and experienced. Through clinical observation, interviews, and work with a national trial of the Enhancing Oncology Model, this paper explores how patient-reported outcomes reveal the multiplicities of knowing cancer based on context, setting, and practices. Taking steps toward seeing cancer beyond strict biological approaches, I examine the ways clinicians, through their practices and discourses, construct cancer as a biopsychosocial process. This paper directly addresses the dualism between the cancerous body as a medical object and medical subject. I suggest that by addressing cancer as multiplicities, we can better treat the physical and social realities of cancer.

Discussion

4168 Vital Remains: Spectral Materiality in Environmental Toxicity

Start Date: 11/21/2025 8:30 AM **through** 11/21/2025 10:00 AM

Venue: Marriott **Room:** Studio 3

Type: Oral Presentation Session

This panel builds upon Avery Gordon's influential concept of haunting as a social fact that "refers or directs us to what is living and breathing in the place blinded from view: people, places, histories, knowledge, memories, ways of life, ideas" (Gordon 2017). Anthropologists have applied Gordon's framework to understand demands of justice and ways to address the unspeakable following state violence (Strong 2021), war (Rubaii 2025), and economic-political instability (Klima 2019). This literature positions the spectral as an absent presence, often outside space and time (Langford

2016; Good et al. 2022). We propose expanding the conversation to examine spectral materialities where haunting manifests through vital remains in land and waterscapes. The temporalities of "slow violence" (Nixon 2011) and "alterlife" (Murphy 2017) produced through environmental destruction, toxicity, and racism reshape our understanding of spectral presence. We ask: How might we also consider those elements that may not "live or breathe"-oil, pesticides, pollutants-yet still actively reconfigure place? Can the concept of "vital remains" help us attend to the accumulation of environmental harm not merely as remnants of the past but as active forces shaping the present? This panel investigates how the disruptive return of vital remains might enrich our understanding of the ghostly in material contexts.

"Vital" describes the liveliness and force of material substances (Gordillo 2014; Lyons 2020). "Remain" functions both as a noun describing materiality-pesticides, pollution, and tidal waters-that defy oppositions of absence and presence and as a verb signifying the ongoing haunting of environmental racism, degradation, and toxicity. From pesticides in Karen refugee camps to petrochemical pollution in post-Franco Catalonia, we examine toxic substances as spectral presences that are "blinded from view" but engage other senses. From oil spills interacting with algae in Turkey's Gulf of Izmit to plantation histories in South Carolina's tidal waters, we illustrate how environmental materials disrupt linear time as "what seems to be out front, the future, comes back in advance: from the past" (Derrida 1993). While the landscapes we study are marked by traces of environmental degradation, extraction, and toxicity, this panel also highlights moments where nature strikes back, refugees refuse, and communities engage in liberatory movements. Drawing on Derrida's proposition that "learning to live with ghosts" (1993) creates possibilities for more just modes of existence, we suggest that recognizing the vitality of materiality allows us to acknowledge and respond to the spectral presence of environmental toxicity and its ethical demands upon us.

Presentation(s): Toxic Remains and the Hauntings of Home: Critiquing Tasteless Life in Mae La Camp

I investigate sensory politics in Indigenous Karen refugees' discourses about living and dying with synthetic fertilizers, herbicides and pesticides in Mae La refugee camp. In Mae La, located on the Thailand-Myanmar border, gardens have become a means of survival in the nightmarish wake of "humanitarian abandonment" (Dunn 2017) since the mid-2000s. A humanitarian imperative of "self-reliance" necessitates that camp residents sell the produce from their gardens in the camp market to make ends meet. Selling to the camp market prompts many gardeners to adopt the use

of synthetic fertilizers, pesticides and herbicides which are considered by residents to grow "bigger", "more beautiful" vegetables thought to sell better at the market. This is even while many residents critique the use of synthetic inputs as "unhealthy" and the camps as a place where "tasteless" and "old-tasting" food is grown. My interlocutors contrasted this with the absent presence of "flavorful", "healthy" and "fresh-tasting foods" remembered and longed for from their home villages. Such sensory critique and refusal took on a darker edge when—seemingly exhausted by the imperative to sustain bodily life in the absence of freedom of movement and self-determination—some camp residents chose to take their own lives by ingesting these same herbicides and pesticides. This stark biopolitical refusal of tasteless life creates new forms of haunting in the camp.

Presenter(s): Terese Gagnon

Environmental Disaster as Time Out of Sequence: Algal Phase Shifts of Oil

In August 1999, the faultline passing through the Gulf of Izmit, a narrow basin crowded with an oil refinery and multiple heavy chemical industries between the Black and Mediterranean Seas, broke, causing a 7.9 magnitude earthquake. The coastal ground where the refinery stood was almost liquified, causing PAHs (polycyclic aromatic hydrocarbons) to leak into the sea from uncontrolled discharges of petroleum industries for weeks. Marine biologists traced the molecular dialogues between spilled oil chemicals and algal proliferation in the Gulf for the following decade. In 2007, an unexpected algal aggravation took over the majority of the water column. Similar algal formations repeated in 2015 and turned into a major breakout in 2021. This paper attends to the 8-year gap between the 1999 earthquake and the first sighting of the algal aggravation as a space of spectral temporality, time out of sequence, where the interactions between oil remains and the algae were negotiating the ecological rupture opened by the sudden spill from the refinery. The seafloor archives the spilled chemicals for decades while coastal upwelling opens their circulation. Looking through the molecular conversations between algae and spilled oil, within the speculative space of the temporal gap between the spill and the aggravation, the environmental disaster appears as an act of vital materiality and a temporal collapse where the spill of 1999 mixes with the aggravates of 2007 and further.

Presenter(s): Eda Tarak

"They Take Advantage of the Night:" Spectral Fascisms between Mercè Rodoreda's Death in Spring and Nighttime Pollution in Petrochemical Catalonia

When the renowned Catalan writer Mercè Rodoreda returned to Barcelona after living in exile during the Franco regime, she wrote her final novel Death in Spring. Based in a fictional mountainous Catalan town, Rodoreda's characters navigate landscapes that threaten fear and violence: rivers groan, neighbors cannot be trusted, bodies of the dead are buried in living trees. Night becomes a time to navigate these landscapes and discover the dark underbelly of the mountain town. As an ethnographer, the novel haunted my fieldwork in Tarragona, Spain, a place in which the Franco regime's implementation of petrochemical infrastructure lives on in altered

ecosystems and chronic illness. In this paper, I explore the ways in which Rodoreda's treatment of the spectral might train us to ethnographically read post-fascist and emerging neo-fascist violences that act upon the nexus of bodies and landscapes. I juxtapose Rodoreda's writing about

the night with a phrase that my interlocutors used when discussing petrochemical pollution: "they take advantage of the night," they'd say, to pollute while residents are sleeping. I consider the haunting of nighttime pollution alongside the material qualities of volatile organic compounds that are especially noticeable at night and foundational to plastic production as petrochemical industries re-assert their relevance for the future. How might Rodoreda's final novel enable us to trace spectral presences, whose forms, of course, shift at night?

Presenter(s): Kathryn Gougelet

Tidal Hauntings: The Maintenance of Violence and Traces of Liberation

In the South Carolina Lowcountry, the ghostly forms of plantations can be glimpsed from above in the checkerboard of rice fields slowly holding water as they dissolve into the sea, a testament to the enduring influence of slavery on the built and natural environment. Closer to the ground, attendant white supremacist projects mark, shift, and route water across the landscape— reconstruction-era phosphate mounds mire runoff, segregationist drainage ditches separate communities, and legacy pollutants swirl in floodwaters. In the current rapid sea-level rise, tidal water is colloquially described as animate, finicky, and spectral in that: it "remembers," "knows no boundaries," and "has nowhere to go." I explore how flows of water and the toxins they carry illuminate the conduits for past violences into the present, while also considering material traces in the environment that might not have the same capacity for endurance. How do Lowcountry landscapes remain haunted by whiteness while emancipatory environmental histories seem to dissipate? Though the Lowcountry is often figured as a haunted space, this risks eliding active projects and continual maintenance required to hold its eroding form. White supremacy continues to shape landscapes of extraction and oppression. But conversely, the Lowcountry is also saturated with the liberatory traces of fugitivity, marronage, and abolition—forces that haunt white elites—yet hold the possibilities of reconfiguring coastal horizons.

2775 Between the Studium and Punctum: Omissions, Refusals, and New Modes of Visual Witnessing

Start Date: 11/21/2025 8:30 AM **through** 11/21/2025 10:00 AM

Venue: Marriott **Room:** Studio 4

Type: Roundtable/Town Hall

This roundtable interrogates the power and implications of the images we choose not to create or share, moments intentionally left unrecorded or hidden from public view. Drawing on theoretical insights from Ariella Azoulay, we ask: What does it mean to withhold photographic evidence of

painful or quotidian encounters? In not showing these encounters, do we disrupt violent representational practices or risk replicating them in more insidious ways? Our discussion highlights how memory, responsibility, and complicity are entangled in the seemingly simple act of pressing, or refusing to press, the shutter.

We examine photographs that remain unrealized or fail to surface due to ethical concerns, trauma, or uncertainty about how best to depict haunting realities shaped by racial, colonial, and political forces. Paradoxically, these absent images carry their own haunting presence: they remind us that seeing is not always believing and that what remains unseen may exert just as much influence on our understanding of the world. Drawing on Azoulay's idea that photography "always includes more than what one wants it to contain," we acknowledge how images exceed their frames, conditioned by shifting contexts of creation, circulation, and interpretation. By focusing on moments when the camera or its products are deliberately withheld, this roundtable moves beyond traditional debates on visual documentation, suggesting that such refusals and omissions can challenge dominant "scopic" regimes and invite alternative modes of witnessing. In doing so, we aim to open new conversations about the ethical stakes of photographic practice and the transformative potential of writing through what cannot, or should not, be captured on film.

2529 Re-incarnation: The Afterlives of Past Events in Present Bodies.

Start Date: 11/21/2025 8:30 AM **through** 11/21/2025 10:00 AM

Venue: Marriott **Room:** Studio 6

Type: Oral Presentation Session

The notion of "the specter" (Derrida 1994) is useful to engage ethnographically the world of spirits while also allowing for a treatment of time that accounts for what is neither fully present nor absent, but instead lingers. The papers in this panel address the ways in which various ghosts of the past not only haunt the present, but actually re-materialize in living human bodies. Engaging the idea of re-incarnation to explore how oppression and resilience, displacement and attachment, pain and joy, are reanimated through new bodies, we explore the perilous lives of seafarers from the Asian Global South, the afterlives of Ba'th Party rule among Syrian women farmworkers, the ghost-like faces of Brazilian women at the crack of dawn, and the racialized bodies of abandoned infants in 19th-century Peru. These papers move beyond the assumption that past experiences of the self and of territory (national or maritime) are ephemeral or ethereal, and analyze the specific ways in which specters linger and are experienced in the flesh of bodies that play host to the ghosts of

colonialism, slavery, and war.

Presentation(s): Maritime Mobility Violence of Seafaring: the Leviathan, the Argonauts, and the Deadly Sea of Global Supply Chains

From the legendary ghost ship Flying Dutchman to the phantom island Antillia and the monstrous cursed spirit Umibōzu, the sea has been a cross-cultural source, space, and symbol of powerful apparitions thanks to its unexplored and unforgiving nature. This presentation looks at seafaring as one of the most dangerous industries in the world and the lifeways of seafarers who regularly experience existential threats at sea, including extreme weather conditions, industrial hazards and risks, and looming piracy. I argue that the deadliness and dreadfulness of seafaring is not merely due to the perilous nature of the ocean, but also results from the neoliberal arrangement of capital and labor haunted by the specter of colonialism. My presentation examines the interplay between the "integral accident" (Virilio) of modern shipping's technological developments and the international political economy of crew circulation and control. Such interplay disproportionately subjects seafarers largely from the Global South regions of Asia to the maritime and mobility violence of shipping, as these modern "lascars" of global racial capitalism are circumnavigating not only physical currents but also market ones, with the unruliness of the sea being amplified by capital-induced climate change. My presentation thus sheds light on the invisibilized shipping industry with its uneven geography of social toll that delivers 90% of internationally traded goods and sustains everyday lives across the globe.

Inheriting Displacement: Afterlives of Ba'thism in Post-Asad Syria

The monumental fall of the Asad family's 54-year regime in Syria on December 8, 2024 was undoubtedly a watershed. Its profound significance – to all those who lived in fear and languished in the regime's prisons, to the families of the dead and the disappeared, and to those who were forcibly displaced – cannot be underestimated. But moments of transition are also moments of inheritance, no matter how seemingly profound the break with the past. This paper reflects on the many afterlives of Ba'th Party rule among Syrian women farmworkers from the Euphrates region, based on two years of ethnographic research at the Lebanese-Syrian border. Tracking their reckonings of time spanning the long arc of Syria's transition from a state-led model of development, the fraught aftermaths of land reform, the liberalization of Syria's economy that pushed their families into labor migration, the uncertainties of war and displacement, and the

prospects of return that confront them at this momentous juncture, the paper reflects on the ghostly traces of agrarian displacement that these workers have inherited and continue to navigate in their daily lives. Less a wholesale 'transition' to a new era than an afterlife of the many struggles that came before, this is an embodied experience of time that is shot through with grief, attachment, and reckoning with obligations to the living and the dead after more than a decade of war and generations of rural displacement.

Inscribing the Spectral: Registers and the Racialization of Orphans in Late-19th-Century Lima, Peru

Registers produced in Lima's Santa Ana Hospital between 1890 and 1900, present two sets of inscriptions: birth certificates, and the registration of nursing orphans surrendered to the hospital's care. While orphan records specify without exception a racial category for every infant, Santa Ana's birth records never overtly identify a child's racial identity. This contrast reveals two dynamics that are central to race relations in Peru. First, the taxonomy that is created, not by placing people into specific racial categories, but by separating those who are categorized into "a race," from those who are not. Second, the role that family relations play in avoiding explicit racial categorizations and allowing mobility towards, or in-and-out of, whiter racial identities. Orphans present an exceptional opportunity to reclaim the importance of the body in the experience of race in Peru. In the absence of social networks, known lineages, and other racial/cultural signifiers, their phenotypical body became increasingly significant as evidence of otherwise volatile racial identities. In Peru, the inauguration of an independent liberal state ostensibly erased colonial hierarchies and promised equality for all. This paper argues that it was during the early Republican period that incorporeal social differences were actually inscribed on the phenotypic body.

When Makeup Lingers Long After the Party: Late Nights and Becoming a Zombie in Mangueira

While working with makeup artists and their clients in the suburbs of Rio de Janeiro in 2018 and 2019, I often heard snickers over people's appearances, usually articulated as technical critiques of their makeup. One criticism stands out from what were otherwise relatively mundane aesthetic assessments. Aimed at young, Afro-Brazilian women returning home from a night out at the baile funk or local samba school – and still dressed for the night and decorated with bold cosmetics – these critiques highlighted a disjuncture between made-up faces and the embodied fatigue of staying out late. Negative attention often came from the moto-taxi drivers who brought these women home. The drivers, mostly young men, described the women as ghost-like in the light of dawn, calling them "zombies" for the odd contrast created by resilient layers of makeup perfectly preserved above faces that had been drained of blood, energy, and color. This paper argues that such playful disdain is more than typical misogynoir and stems also from the problem of getting stuck in one's face. While theorists often describe the surface of the body and especially the face as mutable and fluid, at least relative to the assumed fixity of essentialized interiors, these episodes invert those frameworks. Indeed, it is the problem of frozen faces, suspended artificially

as bold makeup above ephemeral states of being, that produces the comical, unsettling, and uncanny appearance of the zombie.

1942 From Refusal to Repair: Global Ethnographic Perspectives

Start Date: 11/21/2025 8:30 AM **through** 11/21/2025 10:00 AM

Venue: Marriott **Room:** Studio 7

Type: Oral Presentation Session

Inspired by Professor Deborah Thomas's timely contribution to the 2024 Annual Review of Anthropology, "Refusal (and Repair)," this panel brings together ethnographic engagements with refusal as a political practice and explores its generative relationship to repair in the face of systemic oppression and exploitation.

Taking refusal not merely as resistance, but as an active reimagining of political and social possibilities, our panel asks: how can acts of refusal lay the groundwork for repair-whether in restoring community ties, reconfiguring power relations, or envisioning futures beyond oppressive and extractive systems? We treat refusal as a necessary precondition for repair: a means of unsettling the legitimacy of dominant structures and creating openings for renewal, regeneration, and reparation.

This session features six doctoral students at different stages of dissertation writing, each drawing on recent ethnographic research. Their papers examine practices of refusal across diverse contexts: Black activists navigating the legacies of the Dutch empire, unionized Latino tenants in Los Angeles, anti-poverty organizers in austerity Britain, West African migrant youth in France, grassroots Catholic actors in the United States, and queer Muslims* in Berlin. Together, these cases illuminate refusal as both a critique of the present and a catalyst for imagining otherwise.

Presentation(s): Refusing the Afterlives of Slavery and Colonialism: Repair Activism in the Afro-Dutch Diaspora

In many ways, Black activists in the Afro-Dutch diaspora are part of the forefront of global developments in reparations and repair for colonialism and slavery. This presentation, based on multisited fieldwork among Black activists in Curaçao, Suriname, and the Netherlands, zooms into

a neglected corner of the African diaspora to ask: how are activists refusing the afterlives of slavery and colonialism and what alternative futures of repair do they work towards?

Catalyzed by key developments over the past decade—including the push to confront racism and the blackface figure "Zwarte Piet" in the Netherlands, Suriname's collaboration in CARICOM, and a reinvigorated civil society in non-independent Curaçao resisting a neocolonial Netherlands—movements for repair reached a crescendo after King Willem-Alexander in July 2023 apologized for the Dutch role in the Transatlantic slave trade, asked for forgiveness, and called for healing and repair. Yet refusal—i.e., the fight against the continuation of the afterlives—looks different in each context, despite a shared colonial history. Visions for repair and the strategies to reach them are likewise shaped by local conditions and manifestations of the afterlives. This presentation examines: (1) how the afterlives of slavery and colonialism are locally understood; (2) forms of activism present and their genealogies; and (3) the alternative futures of repair being envisioned and built.

Presenter(s): Ramon de Haan

Hegemony or Refusal? Migrant Tenants and Popular Politics in Los Angeles

In December 2023, the Los Angeles Tenants Union (LATU) rallied hundreds of people to march for the permanent freeze of annual rent hikes. Hikes allow landlords to increase the rents of tenants living in rent-controlled units at a rate determined by the city; however, during the COVID eviction moratorium, evictions were banned and rent hikes were "frozen". That summer, L.A. city government decided to unfreeze the hikes and increase them from the 3-5% standard to 7-9% in order to make up for landlords' losses during the moratorium. Although seemingly innocuous, these "landlord reparations" opened racialized low-income tenants to heightened risk of displacement.

LATU's march, "From Palestine to LA", threaded together different struggles under the banner of a concerted refusal to displacement. Its planning engaged dozens of working-class tenants, primarily indigenous migrants, through the formation of committees that incorporated a Oaxacan band and dance, a vigil, Mexican food, and popular theater to the march. The city rescinded its decision and compromised with a 4-6% increase; yet, it was not LATU's march that directly forced their arm, but the lobbying efforts of a coalition of non-profit organizations. Thinking with the category of refusal, my paper examines 1) how the march's explicit intentions ultimately folded within the hegemonic liberal compromise and 2) how the non-eventful excesses of its planning prefigure libidinal attachments to popular politics.

Time Against Transaction: refusal and repair in the British anti-poverty movement

After 14 years of austerity policy in the UK, brutal cuts to services, and the dismantling of a once robust welfare state, there was hope that 2024's new government would bring in much needed welfare reform. Now, in mid-2025, there have been reforms: sweeping new cuts to benefits, particularly affecting disabled people and their carers. It is estimated that the changes will push

roughly 250,000 people into relative poverty by 2030 (Murray 2025). Already in crisis mode after responding to the UK's departure from the EU, the social breakdown of COVID-19, and the subsequent "cost of living crisis," the anti-poverty movement is under increased pressure to find solutions, make an impact, and offer tangible—and measurable—results.

Drawing on ethnographic material with anti-poverty activists and community organizations across the UK, this paper explores work that meets this urgency with a refusal to rush to solutions and a refusal to understand change through the lens of traditional, quantifiable, metrics of success. In asking what potentialities and limitations this refusal engenders, particularly for how activist and community organizations engage with formal structures of power, this paper also begins to tease out alternative forms of evidence—narrative, relational, open-ended—that make space for different conceptualizations of change and open the possibility of repair.

Presenter(s): Erin Simmons

Refusal of Colonial Charity and Collective Politicization of West African Migrant Youth in France

Each year, thousands of young men and women walk through the doors of Paris' minority evaluation centers, seeking protection from child protective services. They have traveled from Guinea and Côte d'Ivoire, entering France irregularly after "doing boza"; crossing the Mediterranean Sea aboard an overcrowded inflatable boat. The vast majority of them are denied the "unaccompanied minor" status, which would provide them with legal status until their majority, and choose to challenge the decision in juvenile court. During the six to twelve months leading up to the review of their case, they fall into a legal limbo where, neither children nor adults in the eyes of the French State, they are left to fend for themselves on the streets. Sleeping in public parks, they survive with tents, blankets, and hot meals donated by local migrant-aid associations.

In this context, young West African migrants have organized in Paris into a collective, refusing to keep silent and rely on humanitarian support. "We don't want food! If we wanted food, we would have stayed in Africa! We want a future!" Becoming loud and visible through frequent rallies and occupations, they reclaim political subjectivity by holding the French State accountable, if not for its failure to respect children's rights, then for the colonial debt incurred as a result of the continued exploitation of West Africa. This paper posits refusal as making space for repair at the individual and collective levels.

Presenter(s): Lea Coffineau

Radical Hospitality as Theopolitics? Care, Critique, and Catholicism in the United States

As nation-states increasingly eschew their political obligations to refugees, asylum seekers, and economic migrants—or people on the move—faith communities are stepping up to provide critical material aid: food, water, shelter, and clothes. This paper explores the moral and political valences of radical hospitality, a mode of care and critique enacted by grassroots Catholic actors in the contemporary United States, and asks whether radical hospitality works to constitute a form of theopolitics. The first part of the paper describes the context surrounding an ongoing legal case

involving Annunciation House—a Catholic nonprofit that operates migrant shelters at the US-Mexico border—and suggests that when the state's political obligations to people on the move recede, the moral obligations of people of faith become a potent site of political contestation, rendering radical hospitality a juridical problem for American political secularism. The second part of the paper examines radical hospitality as a mode of generating counter-hegemonic social formations based on relations of mutuality, horizontality, and collective responsibility, with a focus on the Catholic Worker in New York City. The goal is to contextualize radical hospitality within Catholic theological traditions and trace the ways in which its relations, valences, and practices not only present a challenge to secular state power but also offer alternative ways of living in the world together.

Queer Refusal as Holding Space: Deportability, Queer Kinship, and Intimacy Beyond Love in Berlin

John Borneman approached kinship through the prism of caring and being cared for (2001), thus viewing practices of relating such as "feeding and living together" as central to the "making of kinship and relatedness" (Carsten 2020). However, Perveez Mody (2020) warned us that kinship is "equally about the dynamics of constraint, coercion and choice." Drawing on ethnographic data with queer Muslims* in Berlin, this paper examines the confluence of love, intimacy and care with power and racialized oppression.

With careful attention to my interlocutors' experience of deportability, I first formulate bordering relatedness structures as hegemonic prescriptions on the conventional nature and limits of interpersonal or communal dynamics. Focusing on the exclusive expectations within and categorical boundaries between "true romantic love," friendship, and allyship, I argue that they transform intimacy into a site of domination and that the selective care they govern is closely related to the selective harm of European border policies.

I then follow Deborah Thomas to suggest that queer refusal goes beyond an aspiration to the modern, free subjecthood and entails sets of practices toward repair. "Soli-marriage" and polyamory become crucial border-crossing relatedness practices to mend the harm of deportability. In their refusal, my interlocutors experiment with unique legal and affective kinship structures while holding space for their displaced/displaceable members.

5037 "Dissident Peace" Book Launch and Roundtable

Start Date: 11/21/2025 8:30 AM **through** 11/21/2025 10:00 AM

Venue: Marriott **Room:** Studio 8

Type: Roundtable/Town Hall

This roundtable will stimulate a lively discussion around "Dissident Peace: Autonomous Struggles

and the State in Colombia." The book provides a rigorous reassessment of the terms of peacebuilding through an ethnography of ongoing struggles for autonomy, based on over fifteen years of research and activism in Colombia.

About the book:

In 2016, the peace accords between the Revolutionary Armed Forces of Colombia–People's Army (FARC–EP) and the Colombian government promised to bring an end to over fifty years of armed conflict. Yet, despite widespread international acclaim and heavy investments in the peace process, war continued. By questioning the potential for peace under the aegis of the state, *Dissident Peace* opens up critical space from which to imagine more liberatory forms of peace. From the coca fields of southwestern Colombia to the negotiating table in Cuba, *Dissident Peace* brings the contradictions of peacebuilding and organizing to life. Throughout the book, Dest locates contemporary violence within longer histories of colonial capitalism and centers the lives and insights of black and indigenous communities in Colombia. He identifies "dissident peace" as a potent alternative to dominant, state-centric peace frameworks—one based on evolving principles of autonomy and self-determination by marginalized communities. With vital implications for social movements globally, this book provides a gripping account of what it means to struggle today.

8320 (Un-)black-boxing AI Agencies: Ghostly and Ghosted Machines, Part 1

Start Date: 11/21/2025 8:30 AM **through** 11/21/2025 10:00 AM

Venue: Marriott **Room:** Studio 9

Type: Oral Presentation Session

The collection of technologies routinely thrown into the "AI" kitchen sink has become as ubiquitous as the value-laden narratives about them. While contemporary computational systems present genuinely new techno-scientific, machinic affordances, many of their supposed novelties are anything but—nor are the narratives, values, or interpretations assigned to them by individuals, groups, and institutionalized personae across both expert-technical and nonexpert domains. This panel explores how regimes of value, narratives, and implicit-to-explicit understandings of personhood and/or agency, reflexively framed as belonging to prior social spacetimes, continue to haunt AI in the present, not despite, but because of diverse narratives asserting its radical novelty (Choi and Babcock 2024). We ask: what enfolded, immaterialized, or absented agencies trail behind or snake through AI? How do epistemic and systemic violences—racism, sexism, anti-Blackness, white supremacy, ableism, and other intersectionally compounding oppressive

structures (Wilf 2023; Seaver 2022; Semel 2021; Benjamin 2019; Noble 2018)-linger, become ghosted from, and interpenetrate with the functioning and uses of, as well as narratives about, AI? And how does the functioning of AI get rendered inscrutable in some contexts-made "invisible by its own success" (Latour and Woolgar 1979)-while in others, it is opened wide to explanations with varying degrees of "truth," "facticity," or legitimization? This panel contributes to ethnographic explorations of AI by synergistically bringing together grounded-theoretical approaches to technological (un-)black-boxing from scholars across fields and (sub)subfields of anthropology (with a particular focus on linguistic and semiotic anthropology; Wortham and Reyes 2015), along with diverse (inter)disciplinary approaches to techno-scientific and material agencies, from STS and HCI to interactional sociology, sociolinguistics, the history of technology, and beyond.

Presentation(s): Becoming a ghostwriter: The scale of literary imagination

Internet literature is a born-digital literary ecosystem in China. Writers typically publish and distribute their first 15-20 chapters for free as a literary gift in the hopes that readers will subscribe for subsequent plots. When tracing the ecosystem of internet literature, an unexpected discovery surfaced from my literary anthropology fieldwork: an internet novelist was sentenced to 10 months in jail for employing AI as a ghostwriter to write 'forbidden narratives' including sexually explicit descriptions.

Machines become increasingly agentive in a Latourian sense (Latour, 1999; 1993) whereas humans seem merely 'language repeaters' in a Derridean sense (Miller, 2009; Derrida, 1998; 1984). Creative writers are meanwhile accused of offloading their literary intention to innocent machines. Between humans and AI, who, then, is whose ghostwriter? To whom do these AI-generated literary works belong, linguistically, epistemologically and legally? Building on two years of ethnographic fieldwork with Chinese creative writers and one year of online textual fieldwork, this paper examines, under the rubric of 'ghostwriting', the ownership of literary imagination through the linguistic, literary and legal lenses. More broadly, this project contributes to the field of literary anthropology by integrating cognitive science, linguistic anthropology and literary studies.

In Attaining the Unattainable: Agency and Creativity in AI-generated Liminal Space

The rise of Generative AI (GenAI) begets a novel modality of human-machine interaction featuring enhanced feedback, reduced human control and intensified machine agency. It also introduces

affordances and constraints to human creativity, along with opportunities and challenges to practitioners in the creative industry.

Artists and technicians experiment with GenAI to generate content, usually following the pipeline of "human-intended prompt"- "machine-generated content"- "human-finalized outcome". Noticeably, to patch the inevitable gaps between the expected result and the AI-generated content involves not only humans' creative agency, but also inspirations drawn from machine-generated contents. The process of attaining "the unattainable" (Bellour 1975 & 2010) hence reflects the immaterialized machine agency conjured in a cognitive space.

Drawing from ethnographic research in an AI-powered tech start-up, along with a close study of a human artist's practice aided by GenAI, this paper initiates a semiotic reading of the AI-involved creative process. It advocates for theorizing the gap between human expectations and machine-generated contents, to explore the potential creativity and dynamics of human/machine agency conceived therewith. Based on Victor Turner's "liminality" (1969), an anthropological concept that signifies concurrent ambiguity and possibilities in transition, this paper explores the potential of reading the gap as an AI-generated liminal space.

Presenter(s): Xinyue Liu

Generating Anxiety: students' ethical grappling with generative AI, authorship, and the self

With AI technologies framed as the newest tool in a plagiarism arms race, are students' technosocial views on authorship and the self diverging from the Romantic notion of authorship at the root of academia's practices, as Blum's (2010) ethnography of internet plagiarism suggested over a decade ago? Interviews with current undergrads reveal many aren't inclined to engage with AI at all, much less to "cheat." Drawn from a larger ethnographic project on student and faculty AI perspectives, this paper explores student narratives around AI as they grapple to ethically position themselves vis-à-vis these and other technologies. A language ideological lens reveals students' fraught relationship with AI's affordances for authorship is informed less by transactional perspectives on higher ed or the allure of remix culture (as Blum argued), than by anxieties around their own efforts being misapprehended as AI-generated, alongside a moral logic centering agency over consumption. The ethical landscape students articulate is haunted by neoliberal fears around 'authentic' self-making and distinction (Gershon 2014, Hsiao 2022); the standardizing specters of racial capitalism, classism, and ableism (Smalls 2021); and longing for the ostensibly less technologically-entangled 90s. All this suggests students are increasingly aligned to Romantic notions of authorship and self-making—albeit with a context collapse (Marwick & Boyd 2011) and animation (Silvio 2010) informed twist.

Presenter(s): Rachel Flamenbaum

Visual Stylistic Stereotypes in Generative AI: A Semiotic Enquiry on Enunciative Agencies

Drawing on a corpus of images produced by diffusion models such as Midjourney and DALL·E, this paper explores how the stereotypification of visual forms influences our perception, visual culture,

as well as aesthetic and moral values. Unlike much of the existing literature on Generative AI—which largely focuses on sociocultural stereotypes (such as race or gender and other discriminatory structures), situating them on the plane of content—I focus on the formal plane of expression to address "stylistic stereotypes," i.e., simplification and homogenization of visual compositions. I will identify visual marks and graphical signs deployed by Midjourney and DALL·E both when different styles are explicitly specified in the prompt (e.g., a painterly style, an artistic movement, etc.), or when no style is mentioned at all. In all these cases, stereotypes manifest through the simplification and kitschification of figurative forms, the homogenization of light and color, the lack of nuance in hues and outlines, etc. I argue that to understand how these stylistic stereotypes are produced within Generative AI systems we need to focus on enunciative agencies: the training databases, their annotation, the algorithms of the models, the user's prompt, the model's reinterpretation of the prompt, etc. This type of semiotic framework furthers the understanding of the diversification of "voices" and enunciative instances and their effect on people unexperienced in art history and visual culture.

7168 Continuity, Collapse or Sublation? Thinking Change When the Old Becomes New

Start Date: 11/21/2025 8:30 AM **through** 11/21/2025 10:00 AM

Venue: Sheraton **Room:** Estherwood (4th fl)

Type: Oral Presentation Session

How do we think radical change while we are living it? Events like the war in Gaza and the Trump-Musk mayhem shatter faith in the order of things; climate change shatters faith in the future; AI shatters faith in humanity, at least for some, even as it bolsters it for others. In this chaotic moment, believing in the end of the world as we know it is a political force in itself, ripping text from context to circulate in strange new forms (Kockelman 2020; Hebdige). Representation fails, intensifying political, structural and epistemic violence worldwide (cf. Spivak 1985). Continuous patterns cannot resist time, nor can their collapse erase the ghosts of the past.

This panel revisits the perennial anthropological problem of continuity and change with a focus on "sublation," the notion that oppositions both cancel and consume each other in time, giving rise to new contradictions that reconfigure old forms in unpredictable ways. This dialectic, central to the

Marxian-Hegelian tradition, has haunted critical theories of history, power and value. Critics argue that a syllogistic logic of negation and synthesis constitutes a totalizing ideology, erasing multiplicity and repressing alternative forms of meaning and being (Derrida 1974, Deleuze 1968, Mbembe 2019). Other interpreters have emphasized that sublation is an essentially contingent process, entailing the failure of coherence due to the inevitability of change (Rose 1992, Buck-Morss 2009, Žižek 2013). While the abhorrent supremacist legacy of Hegelian thought should not be overlooked, we have found that a nuanced reading from the standpoint of our tumultuous present raises important theoretical and methodological problems for our discipline. From diverse field sites and thematic interests, our papers converge on the question of how to think the changing present without assuming that it will be like the past. How is institutional collapse continuous with the internal contradictions of a dynamic system? How do sociocultural practices that have been negated through processes of domination reemerge through collective action? How can explanation or narration of a situation allow for the indeterminacy that makes it new?

Presentation(s): The Intimacies of Violence for Mexico City Transfeminista Activists

This paper examines the intimacies forged by both consensual and nonconsensual forms of violence for transfeministas in Mexico City. Mexican feminist philosopher Sayak Valencia's definition of transfeminismo emphasizes the Latin American context in which it arose and arguing that cis women, trans women, and sexual and gender dissidents should be political allies because they are all targets of violence (including murders, rapes, and disappearances) by a necropolitical heteropatriarchal cisgender system (Valencia and Zhuravleva 2019). Transfeministas are further united by their rejection of the exclusions of mainstream feminist and lesbian movements, embracing techniques and tools that TERFS and SWERFs define as violence, such as practicing BDSM, making postpornography, manufacturing dildos, and centering sex workers and trans people in their feminism. Based upon ethnographic research in Mexico City in 2021-2024 among activists, artists, and pleasure pedagogues, this talk centers the critical pleasure activism of Latin American transfeministas who make pleasure a communal value that lubricates the frictions of violence from within and outside of lesbian and feminist movements. Their community is sustained in part through practicing consensual forms of violence as well as sublating violence (both from the outside world as well as the community's practices) and pleasure.

Presenter(s): Sarah Luna

Political Antagonism and Sublation: An Ethnographic Theory of the Brazilian Popular Right

How did a figure like Jair Bolsonaro—veteran of the most venal politics—come to symbolize repudiation of corruption for many Brazilians? Generally, how do political figures come to stand in

for the repudiation of the very things they embody? The answer may help us understand the emergence of contemporary popular right-wing politics, along with the structures of contemporary political antagonism, in Brazil and beyond. The last decade of Brazilian history has witnessed a popularization of forms of political sentiment invested with increasingly antagonistic affect--from rifts over the legacies of recent governments, to those involving ethnoracial, religious and other forms of identification and affiliation. Many of my interlocutors who were uninterested in politics two decades ago now describe certain others as threats to the nation. This is usually glossed with the spatial metaphor of polarization, depicting the polity as pulled from the center by two radicalizing extremes. This metaphor can be useful, but it neither captures the cross-cutting nature of these political antagonisms, nor the sometime radicalism of the self-styled center, nor the dialectical process through which seeming opposites structure a transforming totality. Drawing on ethnographic research in Rio de Janeiro and Maranhão and focusing on working class people who recently voted for the right, this paper offers an alternate theory of political antagonism, focused on this relation of seeming opposites.

Presenter(s): Sean Mitchell

Refusing to Fear: When US Immigration Policy Changes, What Remains?

“We’re not going to be afraid of Immigration.” Juana spoke those words to her undocumented niece Sonia while they agonized over Sonia’s upcoming court hearing. Sonia missed a previous hearing and might have a deportation order awaiting her. It was February 2025. But Juana advised against fear. She told her niece, We’ll go to court together. Juana’s phrase echoed the activists who, in 2010, proclaimed themselves “undocumented and unafraid” while getting arrested at the US Capitol. From 2010 to 2025, the context had turned upside down, yet that nugget of text – the reckless, deliberate word “unafraid” - remained. This paper reaches for the notion of sublation in order to understand the refusal of fear, a gesture whose meaning has changed. In the 2010s, immigrant activists pioneered the “unafraid” tag to declare a new political style that was more confrontational and personal. Democratic leaders took up the “unafraid” line, both canceling and preserving it by turning it into administrative practices: you should be unafraid to apply for financial aid, WIC, or a license. This paper’s ethnographic challenge is to track the dispositions that immigrants developed under this regime, in upstate New York, and to chart the Trump transformations. Or, perhaps, the Trump sublation. Today’s authoritarians do not destroy Democratic precedent but bring out its contradictions, leaving Juana and Sonia to mirror the stance by now claimed by Trump himself: defiant, battered, unafraid.

Presenter(s): Gregory D Morton

Jackson’s Commons: Sublating Violence at the Burundi-Congo Border

Separated from his family by civil war when he was six, Jackson Nahayo fled from Burundi to Congo to Tanzania to Mozambique to Zambia, finding temporary protection with strangers without ever living in a refugee camp. Twenty years later he returned to the place of his abduction, at the Burundi-Congolese border, to establish a medical clinic, organic farm, orphanage and primary

school. Named Ubuntu, “I am because we are”, this project is governed by an ethos of open reciprocity: from each according to their abilities and to each according to their needs (Marx 1867; Sahlin 1972; Graeber 2011). It is a community based not on mutual identification but on a habitus of improvisational practice among linguistically and culturally heterogeneous participants, including locals, patients, volunteers and refugees. Based on preliminary fieldwork in Burundi, this paper considers the Ubuntu Project as a commons that both preserves violence as a symbolic resource and negates it through the emergent norms of collective action. The commons is a conceptual site of contradiction insofar as the conservation of shared property subsumes the hierarchy of individual claims (Ostrom 1990). The history of modernity has entailed the sublation of the commons by the violence of capitalist accumulation and the state. In the current context of political dysfunction and climate stress, however, Jackson’s commons sublates violence past and present by mobilizing uncertainty as a foothold for invention.

Presenter(s): Lisa Simeone

Throuple Trouble: Racialized Regimes of Property and Sex in the New South

Since the late 1990s, reconfigurations of property regimes in the so-called New South have coincided with transformed regulations of sex and family. This period has featured increased manufacturing, proliferation of agribusiness plantations and toxification from agroindustries, dispossession of (particularly Black) small landholders, suppression of labor unions, and ever-expanding prison industrial complexes. Likewise, the region has been at the forefront of draconian homophobic, transphobic, as well as anti-reproductive justice legislation, including restrictions on access to birth control and abortion. Regimes of both property and sex, however, arise from and echo sexual and economic orders from prior regimes of racialized land and labor. Through the concept of sublation, this paper explores some of the ways we can make sense of these continuities and transformations through a focus on a 2021 homicide involving a queer interracial “throuple” on the property that was the site of Camp Sister Spirit, a lesbian feminist educational and cultural retreat center in rural southern Mississippi. The spectacularized media coverage, as well as the particularities of the juridico-legal unfolding of the case, offer insights into articulations of “family values” at the limits of its most nightmarish transgression. This amidst everyday queer pleasures and intimacies transpiring among those overtly challenging racialized property and sex regimes in forms of LGBTQ+ activism in the region.

3867 Shifting Ground: Politics of Eroding, Crumbling, Collapsing, and Burying - Part 1

Start Date: 11/21/2025 8:30 AM **through** 11/21/2025 10:00 AM

Venue: Sheraton **Room:** Gallier AB(4th fl)

Type: Oral Presentation Session

This panel approaches the ways that we might examine the concept of erosion, as both a material process and powerful metaphor for the Anthropocene. Erosion often arises urgently as a problem in

places where the land-water interface itself is increasingly blurred and shifting—for example, built shorelines, rivers, wetlands, streams, canals, and other "muddy margins" (McLean 2011)—but just as critically in ecologies of forest, dirt, sand, and dust, where movement might be intensified by the progressive loss, rather than addition, of water. Processes like erosion are variously parsed as natural and unnatural, "problematiz[ing] modernist divides between nature and culture" (Vaughn 2021: 851). This panel considers the temporal and environmental politics of eroding, crumbling, collapsing, burying, and other forms of 'breaking down', asking: Through what forms of knowledge and expertise do people construct the problem of erosion and other land movement? What kinds of politics and practices does erosion bring about? Through what temporalities do these processes unfold, and what does it mean to think with these forms of temporality? At what material, temporal, and political scales might we consider erosion to be operating? How is repair envisioned within such multi-scalar temporalities?

We are interested additionally in the relationship between these material processes and broader ideas of breakdown. 'Crumbling' and/or 'eroding' infrastructures, landscapes, structures, materials, and more are often written alongside other phrases such as collapsing, burying, or breaking. What then becomes of these terms, especially in their various spatio-temporal registers? How is crumbling related to accumulation—as antonym? as effect? We encourage greater specificity around the language of environmental 'breakdown', recognizing that crumbling and erosion do not only signify ecological loss, but are also a question of how and where material reemerges. What kinds of political imaginaries do they foreclose, and what alternatives might they open?

Presentation(s): Embodied Knowledge and Plantation Re-Worldings in Fiji

Recent environmentalism initiatives in "disaster resilience" and "sustainability" in Fiji have turned to indigenous/traditional knowledge systems to envision what environmental restoration and adaptation might look like in a time of climate change. Because traditional knowledge practices have been politicized in ethnonationalist rhetoric as a return to pre-contact/pre-colonial "indigenous" Fijian lifestyles, this focus often obscures plantation histories and how they have irreversibly altered and created "new" landscapes. In this paper, I take a phenomenological

approach to studying Indo-Fijian sensory knowledges of the farmscape, often expressed through weather forecasting, seedling selection, and taste. I argue that local knowledge in Sigatoka draws from Indo-Fijian embodied knowledges and plantation memory and thus becomes a dynamic record of landscape transformation, introduced plants, and built environments, challenging colonialist interpretations of indigenous knowledge as ethnobiology limited to endemic species and ecosystems. Indo-Fijian farm work and the embodied knowledge about food, land, and labor that it produces redefines Fiji as a place of many reworldings, a landscape that has been changing much before the media turned its lens to the Pacific for jarring visuals of rapidly devolving environments. In conceptualizing Fiji as an always "new" place, Indo-Fijian farmers challenge who and what can be considered as "local".

How to Train a River – Anti-Erosion Engineering along a River-Border in the Bengal Delta

Between the districts of Murshidabad in India and Rajshahi in Bangladesh lies the Ganga-Padma river, a "river-border" between the two countries. The land-waterscapes in this region are constantly shifting because of the amphibious nature of the Bengal Delta, resulting in widespread erosion and disastrous loss of homes as riverbanks keep eroding. While explaining his department's anti-erosion plans along the catastrophically eroding banks of the Ganga-Padma at Murshidabad, India, an engineer shrugged and said, "The whole thing is an impossible task". The catastrophe of river-erosion itself is merely the act of the river's movement. But this otherwise natural act has been made disastrous through the effects of a barrage (or a diversion dam) and an imposition of mobility restrictions with a border infrastructure. To 'solve' the problem of erosion, the engineer knows he must simultaneously confront multiple things – a border, a barrage, and a river that won't stop shifting. An impossible task. Drawing on archival and ethnographic fieldwork, I examine this 'impossible' endeavor to engineer and 'fix' a landscape. I trace anti-erosion engineering interventions, also called river-training, along the river-border, navigating through existing histories of engineering and bordermaking and intensifying climate crises.

Silt, Sediment, Sludge: Erosive and Accreting Materialities in Honolulu, Hawai'i

In the upper volcanic ridges framing Honolulu's northeastern edge, an amalgamation of long-term ecological and social forces has created highly erosive conditions, from which forest debris and sediment clog nearby streams and exacerbate flooding along them. One solution for reducing the risk of flooding in the suburban valleys and urban lowlands, according to this assessment of the city's environmental conditions, is to remove the source of sediment and debris by eradicating the brittle invasive trees that have taken shallow root, and swiftly spread, since the early years of Hawai'i's Territorial Period. At the watershed's base, a polluted canal accumulates silt, sediment, sludge, and debris, accreting on and under its surface the materials of a landscape that appears to be further fragmenting. The problem of erosion here raises questions of pace and dispersion, implicating the temporal and spatial scales of an erosive and accreting materiality, one which

moves across categories of the urban and forest, of land and water, of the natural and unnatural. Through ethnographic research conducted across eighteen months in Honolulu, this paper probes the connections between erosion and scale-crossing. I consider how material dispersion implicates ordinary and continuous acts of labor, as much as it draws in events of history—invasive trees and the territorial occupation that brought their introduction—as well as the still to come—'nature', as it might have been and might yet be.

Presenter(s): Stephanie Ratte

Wasting Sediment in Savannah Harbor

Savannah's port and logistics hub depend on dredging, and the work never ends. One can find a dredge sucking sediment from the lower Savannah River at any hour of any day. Around six million cubic yards of sediment, roughly 625,000 dump truck loads, are dredged from the inner harbor every year. The journey of those sediments began in the Appalachian Mountains (probably long ago) when weathering processes separated particles from larger rocks and eroded soils. Wind and water transported the sediment downhill and into the river, where its movement was shaped by the articulation of physical processes with institutional and infrastructural arrangements. This is a political geomorphology, a phenomenon illuminated by the fate of sediment dredged from the harbor. Silt and sand are piped into the Savannah Harbor Dredged Material Containment Areas, a government-managed facility that covers eight square miles and stores the unfathomable volume of earth removed from the harbor since the mid-twentieth century. Drawing on historical and ethnographic research, my presentation puts an emerging body of scholarship on geology and society into conversation with discard studies. I show how, through dredging, containment, and institutionalized value regimes, sediment becomes waste. I conclude by discussing efforts to reimagine dredged sediment as a resource for beneficial use.

Presenter(s): Ashley Carse

Dumping Responsibility: Sediment as "Garbage" in Mexico City's Drains

Every time it floods in Mexico City – which is nearly every week during the rainy season – the government redirects the blame towards the victims themselves, alleging that it is their practice of dumping "garbage" (basura) in storm drains that is the root cause of their own suffering. Through fantastic imagery of piles of consumer waste and implied (and flawed) analogies to a household plumbing system, the government asserts the apparently obvious: garbage clogs drains and causes floods. What this analogy ignores is that the vast majority of the so-called garbage removed from the system is in fact sediment, a combination of both dirt ripped from the hillsides by the rivers that flow into the city's drains and, in smaller proportion, human excrement. Such sediments must be removed regularly from the drainage system, but a lack of funds means that the government rarely does so until after a flood has already happened. This talk examines how the government and media have erased sediments visually and discursively from the public sphere, leaving only consumer waste as the lightning rod for all the city's drainage woes. It traces how both drainage workers and residents, including flood victims, encode this mythology of garbage with racist and

classist tropes about the uncivilized urban denizen. This reproduces social division and renders nearly impossible any serious critique of – and collective response to – the government's failure to maintain the drainage system.

2436 Cyborg Intimacies: Explorations in the Technological Mediation of Intimate Relationships

Start Date: 11/21/2025 8:30 AM **through** 11/21/2025 10:00 AM

Venue: Sheraton **Room:** Grand Ballroom A-C (5th fl)

Type: Oral Presentation Session

For an ever-growing proportion of human beings, late 20th and early 21st century technologies (computers, the internet, software applications) have come to mediate our most intimate relationships. We evaluate and initiate contact with prospective romantic partners through smartphone applications, we explore sexual fantasies through interactive live pornography mediated by webcam modeling and content sharing platforms, we follow, interact with and form communities around pop idols through social media and messaging platforms, we utilize digital applications to track and plan our reproductive efforts, and we contemplate a near future in which robots not only facilitate sexual intimacy between human beings, but provide it themselves. The six papers composing this panel explore the technologically mediated intimacies described above and contemplate the intersection of culture, technology and intimacy around the world. Half of these studies center the perspectives and experiences of providers of commercial sexual services. Sexual commerce makes up a large proportion of internet traffic globally, incentivizing sex workers to pioneer the frontiers of digitally enhanced intimacy and making their perspectives particularly valuable for understanding the technological transformation of intimacy. The remaining papers explore other relationships mediated by technology, including couples planning their fertility, singles looking for romantic partners, and fans pursuing intimate connections with pop idols. Each study highlights ways technology mediates intimate relationships, or soon will, and explores what we gain through these technologies, how they transform our relationships, and how they reproduce existing structures of power.

This panel also explores the commodification of intimacy as this process is transformed by new technologies. Both commercial and non-commercial intimate relationships are commodified by the platforms and devices that facilitate our relationships with one another. On the one hand, these technologies potentially offer to expand access to intimacy for some consumers, and to allow erotic entrepreneurs to tap into safer and (sometimes) more lucrative markets for commodified intimate/sexual services. On the other hand, the technological mediation of intimacy may also provide opportunities for the companies that control these platforms to shape our intimate relationships in ways that they profit from but which do not match the objectives of users. Finally, by placing studies of commercial sexual economies in conversation with studies of other intimate

relationships, this panel aims to combat the stigmatizing exceptionalism with which erotic labor and commercial sexual relationships have been examined in the social sciences and illustrate commonalities between commercial and non-commercial intimate relationships and the overlapping processes of technological mediation that shape them.

Presentation(s): Beyond the Binary: Robots and the Future of Commercial Sex

The relationship between sex work and robots has become a focal point in academic and media discourse, often framed through utopian hopes of ending prostitution or fears of expanding its harms. Central to these debates are constructions of sex robots as "sex workers," shaped by narratives that position sex work as inherently harmful—yet rarely informed by engagement with the sex work community.

This paper draws on preliminary findings from a qualitative study with sex workers and clients on their views of robots and commercial sex. Early interviews suggest participants approach robots with an openness shaped by sex work culture—a culture of navigating stigma, embracing experimentation, and often at the forefront of technological change. While mainstream narratives can frame robots as threatening or grotesque, most participants viewed their adoption as inevitable and expressed curiosity about their use. At the same time, invoking sex work's status as "the oldest profession," participants emphasized that robots cannot replace the emotional labor central to sex work, particularly the experience of feeling seen, accepted, and not judged by another human. While robots may not judge, they also cannot offer the relational experience of overcoming judgment. Reflecting the cultural logics of sex work, participants viewed robots less as existential threats and more as tools to be negotiated, adapted, and incorporated within complex human economies of intimacy.

Presenter(s): Delphine DiTecco

Sex, Work, and Screens: Camming and Digital Intimacy in Brazil

This study examines the intersections of labor, intimacy, and digital economies through a case study of Camera Prive, a leading Brazilian camming platform. Brazil's cultural landscape, where beauty and sensuality are celebrated, yet sex work remains deeply stigmatized, shapes how cam models engage with digital platforms. Using digital ethnography, the study explores how performers navigate platform affordances—such as local currency payments and promotional narratives framing camming as both aspirational and entrepreneurial—to establish legitimacy and economic

stability. Through systematic observations, analysis of platform materials, and content produced by a prominent Brazilian cam model on YouTube, this research highlights how camming is discursively constructed as skilled labor and a pathway to social mobility amid economic precarity. However, this positioning also entangles sex work within broader power structures of gender, class, and digital visibility. By centering on the Brazilian context, this study contributes to anthropological discussions on how technology mediates intimacy, commodifies digital labor, and shapes work in platform economies.

Desire and the Digital Self: Mate Preferences and Identity in Online Dating Profiles

The use of dating apps has surged in recent decades, becoming the most common way U.S. adults meet new romantic partners (Rosenfeld et al., 2019). This paper explores how cultural norms and sexual orientation shape self-presentation and partner preferences in digital dating spaces. Using mock dating profiles and survey data from U.S. based participants across four groups - heterosexual and non-heterosexual women and men - I examine how individuals express mate preferences and view their own mate value. While all groups are analyzed, I emphasize non-heterosexual perspectives, which remain underrepresented in mate preference research. Early findings suggest that there are gendered and sexual orientation based differences in commitment-seeking language among female participants, and a stronger focus on physical appearance among male participants. The data also shows preliminary observations that non-heterosexual participants often challenge "normal" courtship behavior through flexible preferences relating to things such as age and trait prioritization. By analyzing profile text and preferred partner traits, I explore how dating profiles commodify intimacy, reflect curated identity, and differ from the face-to-face dating world. By combining qualitative content analysis with statistical comparison, this research offers insight into how online dating spaces mediate intimate connections in ways shaped by both personal identity and broader social norms.

Presenter(s): Holly Love

Streaming the Self: Transgender Women's experiences of Intimacy, Identity, and Labor on OnlyFans

This paper draws from ethnographic interviews with 11 transgender women engaged in online sex work on OnlyFans to explore how digital platforms shape intimate labor and identity formation. I examine how transgender women use internet-facilitated sex work not only as a way to generate income on their own terms, but also as a space to affirm gender identity, negotiate desire, and resist transphobic exclusion from mainstream platforms and economies. Through my informants' accounts I illustrate: (1) how cultural narratives around transgender femininity and hypervisibility influence platform adoption and shape relationships formed with viewers and other content creators; and (2) How OnlyFans enables transgender women to monetize their gender and sexualities in ways they can control, which they report as empowering and a source of economic opportunity. However, not all aspects of this work are perceived as empowering among models. OnlyFans also puts pressure on models to conform to fetishized expectations or market

themselves in ways that reinforce stereotypes to sustain their income. Finally, I argue that while platforms like OnlyFans can reproduce neoliberal capitalist and gendered power structures, they also create room for transgender women to challenge norms of intimacy and claim agency through their performances of self-representation and erotic play.

Presenter(s): Patricia Fernandez

Scheduling Sex: App-Mediated Intimacy in Japan and the United States

This paper applies a mixed-methods approach to analyze people's experiences with fertility awareness apps in Japan and the United States, two countries with quite different reproductive landscapes. In the 1920s, doctors Kyusaku Ogino in Japan and Hermann Knaus in Austria independently observed the timing of ovulation within the human menstrual cycle. Now, one hundred years later, people around the world can access fertility awareness apps on their smartphones, with algorithms providing dates for ovulation and menstruation based on user-provided data such as basal body temperature, menstrual bleeding days, and more. Preliminary qualitative and quantitative content analysis of Japanese developer websites and the apps themselves show a strong emphasis on facilitating optimally timed sexual intimacy between heterosexual couples who are in the midst of *ninkatsu* (trying for a baby), reflecting widely-held beliefs about the purposes of sexual intercourse in intimate relationships, the availability and popularity of non-hormonal contraceptive methods, and prominent public discourse surrounding the country's declining birthrate and shrinking population. On the other hand, content analysis of Euro-American apps and ethnographic interviews with app-users in the U.S. demonstrate more varied contraceptive and sexual intimacy practices, as well as greater concerns for data privacy in the context of weakened legal protections of reproductive rights.

3994 New Ethnographies of the US Carceral State: Authors Meet Readers

Start Date: 11/21/2025 8:30 AM **through** 11/21/2025 10:00 AM

Venue: Sheraton **Room:** Grand Ballroom D (5th fl)

Type: Roundtable/Town Hall

Until recently, anthropological attention to systems of policing, confinement and control in the United States have been modest. This roundtable will feature a discussion of three new ethnographic monographs that explore distinct aspects of the US carceral state. "The Criminal Record Complex: Risk, Race and the Struggle for Work in America," by Melissa Burch, chronicles the daily interactions of hiring managers, workforce development professionals, and job-seekers with felony convictions in the Southern California, revealing a set of actors, institutions and industries that stand to benefit from the erroneous idea that people with criminal records are dangerous to employ. "Life beside Bars: Confinement and Capital in an American Prison Town," by

heath pearson, illuminates an alternative history of the unruly and unexpected ways that people resist, get by, make money and, most especially, build radical social life beside systems of large-scale confinement. "Healing Movements: Chicana-Indigenous Activism and Criminal Justice in California," by Megan Raschig, tracks a grassroots abolitionist project cultivated by formerly incarcerated women and men, whose praxis of cultural healing centers mutuality and joy while countering local correctional institutions and more pervasive carceral logics of deficit and disposability.

Comprised of six anthropologists (Catherine Besteman, Melissa Burch, Kristin Doughty, heath pearson, Megan Raschig, and Damien Sojoyner), this roundtable will engage in dialogue centered around the many intersections of the books: from the haunt of confinement ordering the land to the afterlives of convictions haunting people trying to find work; through the generation of novel practices of care and worldbuilding against and beyond the non-profit industrial complex; between the forces of abolition and the baby steps of reforms; and, amidst the struggles for survival and the futures made through solidarity and with joy.

8996 The Changed Federal Funding Landscape for Anthropology Research

Start Date: 11/21/2025 8:30 AM **through** 11/21/2025 10:00 AM

Venue: Sheraton **Room:** Grand Ballroom E (5th fl)

Type: Late-Breaking Roundtable/Town Hall

Since January 20, 2025, federal research funding has radically changed. The Executive Order freezing foreign aid immediately impacted USAID-funded anthropologists. Additional Executive Orders throughout Spring transformed what agencies deemed "fundable." In late April, NSF began issuing termination notices following its comprehensive reviews to align current funding with new policies. Many termination notices stated projects did "not effectuate NSF priorities" because impact was "limited to subgroups" and didn't "create opportunities for all Americans everywhere." The May 23 "Restoring Gold Standard Science" Executive Order could substantially redefine fundable research depending on interpretation. Its emphasis on reproducibility risks eliminating qualitative research and ethnography funding central to cultural anthropology. NSF's July 30 "Update on NSF priorities" stated: "NSF is continuing to prioritize cutting-edge discovery science and engineering research, advancing technology and innovation, and creating opportunities for all Americans in every region" further signaling an end to funding for cultural anthropology or qualitative social science research.

Roughly \$1.5 billion in active federal research funding has been terminated. The FY2026 Budget Request proposed eliminating nearly \$5 billion of NSF's \$9 billion budget. Congress hasn't voted on FY2026, so NSF budget cuts remain uncertain. Since May 2025, NSF has undergone massive reorganization and downsizing, though court orders and injunctions have paused/slowed changes.

Private foundations have responded to the crisis. Spencer, Kapor, William T. Grant, and Alfred P. Sloan Foundations launched rapid response bridge funding providing up to \$25,000 grants for scholars impacted by NSF cancellations. Robert Wood Johnson Foundation extended support to investigators whose federally-funded health equity work was cancelled. Private foundations saw applications spike in 2025. Wenner-Gren Foundation cited these events when closing Sapiens magazine to direct more resources toward anthropological research. However, private foundation funding is insufficient to fill the gap.

This townhall brings together anthropologists whose federal grants were terminated, those whose high-scoring proposals weren't funded due to current priorities, and those with insider perspectives on federal agency evaluation processes. We represent cultural anthropology, medical anthropology, archaeology, and applied anthropology subfields. Some projects involved interdisciplinary collaboration. Panelists will share insights, compare differential impacts between private and state-supported universities, provide navigation guidance, and contemplate ways forward for supporting anthropological research.

8611 Hunting the Sensibles: Performing Anthropology Across Media (Part A & B)

Start Date: 11/21/2025 8:30 AM **through** 11/21/2025 10:30 AM

Venue: Sheraton **Room:** Grand Couteau (5th fl)

Type: Workshop

This workshop will be led by six anthropological filmmakers, artists, and music composers, structured in the format of Workshop A/B. The workshop will include rich interactions between the facilitators and participants, utilizing a multi-media approach that features anthropological films, dynamic images, artist books, and musical works to present topics such as multi-species anthropology, materiality and labor, and feminism. After the workshop, participants will receive thoughtfully designed materials that extend the experience. The specific agenda for the workshop is as follows:

Workshop A: Screening of Experimental Anthropological Films, which includes four short films and a post-screening discussion:

1. Xiaohui Liu (Director): Arbors, Herbs and Banana Leaves, documentary, 30 minutes.

2. Juntao Yang (Director): Light and Cold Conversations: Atlantic, Algorithms and Visibility, single screen digital moving Images, 13 minutes 11 seconds.

Post-screening discussion facilitated by Xiaohui Liu, Pengrui Ou, and Juntao Yang.

Workshop B (Artist Presentations and Interactions):

1. Wang Xue Sophia: Henna, Documentary Photo Book, and Henna Ritual Workshop.
2. Renee Yu Jin: I'm Rooted but I Flow, Artist Book Presentation on the relationship between sculptural materials, the human body, manual labor, and the surrounding environment in China.
3. Yuwan Zhang: Multi-species Music Sharing and Interaction, including audience participation in music creation.

2861 Ghosts and their Multimodal Stories in the South through an Afrofuturist Lens

Start Date: 11/21/2025 8:30 AM **through** 11/21/2025 10:00 AM

Venue: Sheraton **Room:** Maurepas (3rd fl)

Type: Roundtable/Town Hall

The ghosts of our ancestors from Precolonial Africa to the first Black explorers of the Americas are not merely echoes of history that exist in archival records; they persist in present relationships, and they shape the future (Concha-Holmes 2025, Lamarre 2022). Afrofuturist thought provides frameworks to examine the speculative to spark courage and summon spirit for liberatory praxis from Pangea to beyond 2000s. Latin American Afrofuturist frameworks help us interpret Afro-Mexican archives to imagine beyond colonial temporalities (Tenorio 2023). Those that jumped overboard to resist the Middle Passage have their songs within the hearts of those who remained on board and gave birth to generations of African descendants who have cultivated the lands and fought for freedom (Stevenson 2019). The ghosts speaking in our ears become echoes of social influences that infiltrate medical establishments that deeply impact black maternal health and even infant feeding choices (Banton 2011).

The ghosts' stories also impact Afro-Colombian political mobilizations, which are founded upon the spirits of humans and more-than-humans (Cárdenas 2024). The supernatural play a crucial role in uprisings. Rights-based claims to the state have become necessary and pragmatic tools in the intersecting struggles for racial, economic, and social justice, yet they continue to be ineffective due to Colombia's entrenched colonial racial hierarchies. These hierarchies influence many Argentines who are haunted by Afro-descendants in their family history. They feel they cannot claim their Blackness because of the national mythology of whiteness regardless of phenotype (Anderson 2022).

These untold stories of everyday people tapping creativity and collectivity help us to understand "ghosts" in the media mix of Hip-hop, comics, anime and online worlds. Black diaspora content creators archiving and building Black knowledge exemplify the skillful use of digital tools to create

spaces where people can imagine and create multiple meanings of Blackness in the present and the future (Heyward-Rotimi 2023). Likewise, in Florida places like LaVilla, known as the Harlem of the South because of the rich cultural heritage of African descendants, has been preserved through digital tools (Victor 2022). Referencing the ghosts of "unseen" everyday acts in popular culture makes visible those daily vulnerabilities that historically have been ignored or erased (Fischer 2024, Hurston 1934).

All of our works highlight the sonic, visual and multimodal methods of storytelling. The presenters reflect and build on Harrison's legacy through the art-integrated research methods of ethnographic inquiry. We illuminate how understanding these ghosts and their stories through a Black feminist lens and multimodal, digital anthropology serve as a catalyst to cultivate a shared sense of humanity through cultural competency (cf Stevenson) and combat race-based violence to improve a shared sense of humanity.

1868 GLOBAL PALLIATIVE CARE AND THE MAKING OF GOOD DEATH

Start Date: 11/21/2025 8:30 AM **through** 11/21/2025 10:00 AM

Venue: Sheraton **Room:** Napoleon BR A1 & A2 (3rd fl)

Type: Oral Presentation Session

While definitions vary, palliative care can be understood as an interdisciplinary form of care that seeks to increase quality of life in people with serious and terminal illness by mitigating physical, psychological, and moral suffering. Originating in the United Kingdom and the United States in the 1960's, palliative care has become increasingly prevalent worldwide. Nevertheless, severe inequities in access mean that only a fraction of people in need can receive palliative care, with the largest access burdens affecting low- and middle-income countries. As palliative care globalizes, its meaning, arrangement, and form are inflected with local cultural values, moral concepts, and political and economic configurations, raising pressing questions for anthropologists about personhood, intersubjectivity, and what it means to die well or badly (Samuels and Dekker 2023). Drawing on our ethnographic research in diverse world regions such as Latin America, Sub-Saharan Africa, Europe, and Asia, this panel considers how palliative care takes shape in local settings to reflect on several questions. How does palliative care translate to diverse cultural contexts and come to shape local ideas and goals around death and dying? How do palliative care providers in different parts of the world shape the temporal horizons of death? How might their vision of "good death" align or clash with growing movements across the world for medically assisted dying? How are bioethical commitments to autonomy, disclosure, and truth-telling negotiated in palliative care

wards in different cultural contexts, and to what degree do they reflect local moralities? What does palliative care look like in resource-scarce settings? And how, ultimately, does the emergence of palliative care in new regions shape global quests for "good death"?

Presentation(s): A Moment to Die: Mexican Life Debates and the Paradox of Choice in Palliative Care

Enduring contests between church, state, and individual control over the body in Mexico have recently manifested in a contentious "life debate" over the definition and ethics of "dignified death" (Roberts, 2012). In 2008 Mexico City passed the Advance Directive Law, legalizing "passive euthanasia"—the right to refuse or withdraw life-sustaining treatment—and affording comprehensive palliative care services to the terminally ill through public hospitals for the first time. While these measures have ostensibly helped ameliorate end-of-life suffering, a growing movement of activists argue that the law falls short, rallying around the legalization of assisted dying ("active euthanasia") as central to "dignified death." Drawing on one year of research in Mexico's National Cancer Institute, we analyze how palliative care clinicians work to foster, in their patients, both "death consciousness" and a will to live, a model of care predicated on surrendering to the body's preordained rhythms of life and death. We argue that this orientation gives rise to a paradox at the heart of Mexican palliative care, which simultaneously expands end-of-life choices while making certain choices inconceivable. Our argument has implications for anthropological theories of human agency, provoking hard questions about who is authorized to draw boundaries around life and death.

Presenter(s): Elyse Ona Singer

Thinking Through the Limits of "Relational Care:" The Impossibilities of Accompagnement in French Palliative Care

Palliative care is seen as a model for how to orchestrate "good" deaths inside and outside the North Atlantic. Even in France, where palliative care came late to the medical scene and struggles for resources and legitimacy, recent legislation identifies it as one of the most important solutions to public anxieties around medicalized death. This is because it offers what practitioners call *accompagnement*, or a commitment to relational care that meets patients "where they are." In this paper, I explore the limits of palliative care providers' ability to "accompany" their patients by

exploring two "problem" cases encountered in public hospitals in southern France. There has been a lot of attention in medical anthropology to the ways that "relational care" rather than "choice" allows for better medical outcomes, particularly in contexts where providers and patients are linked through shared cultural norms. But what happens when providers dedicated to "care" do not see patients who hail from similar class, religious, and/or ethnic backgrounds as "sharing" their ontological assumptions about what it means to be human? By attending to this problem, this paper highlights the limits of "relational care" as a solution to the problems created by biomedical models of "choice."

"So That No One Can Say Anything": Situating the Hospital in a 'Good' Death in Tanzania

In this paper we push back against dominant understandings of 'African' home-based care at the end of life, showing how community members in rural Iringa, Tanzania are using the hospital to fulfill social and biomedical care demands. Based on participant observation, interviews with doctors, and community focus group discussions, we argue that hospital death became a way "so that no one can say anything" about kin's responsibility to care at the end of life. Here we highlight the way the place of the hospital is enmeshed in moral economies of end-of-life care, and the material capabilities and performances of kin. Even when a relative was clearly close to death, people chose to bring them to the hospital to die to demonstrate they had done everything possible to care for their family member. Doing everything possible was a key component of a "good" death in this setting, protecting relatives from future accusations and uncertainty. This goal of being socially seen as "doing everything possible" often also put physicians in a difficult position vis a vis how to treat these clearly terminal patients as family members' ideals (and financial constraints) were in tension with biomedical imperatives to diagnose and try to cure.

Rethinking the "Global" in Global Palliative Care

With socio-cultural roots in the UK and US, palliative care has now become part of global health approaches. Thinking with current calls for "decolonizing end-of-life care" (Ntizimira et. al. 2022), we ask how palliative care is not only implemented and adapted, but also innovatively developed in diverse socio-cultural settings around the world. Drawing on ethnographic research in India, Indonesia and Brazil, in this paper we highlight three dimensions of the 'local' making of 'global' palliative care, namely the ways in which palliative care initiatives assemble and develop new insights, the productive flexibility in definitions of palliative care, and the socio-cultural and power dimensions of palliative care practices. Building on anthropologists' calls for attending to "otherwise" practices and interventions of global health (Yates-Doerr et. al. 2023; cf. Kalofonos 2021), we highlight ways in which 'global palliative care' develops through situated local practices that are often a mix of grassroots initiatives, (inter)national training, and socio-culturally sensitive care. Given palliative care's unique position at the intersection of non-curative biomedical care and

social medicine, we suggest that the situated, non-linear and rhizomatic development of palliative care offers pressing insights for rethinking the "global" in both global palliative care and global health.

Societal shifts in dying and end of life care: Potentiality and commitment in Palliative Care Activism in Brazil

In this paper I address the changing cultural landscape of dying and end-of-life care in Brazil. Palliative care has been developing rapidly in Brazil as a new paradigm of end-of-life care, which is being led by health care professionals who have organized themselves as 'PaliAtivistas'— a subject position that combines activism and a professional commitment to changing how care is provided for chronically ill and dying patients. Based on ethnographic research in palliative care centers in Brazil, I show that these professionals strive to establish a form of continuous care for those who do not qualify for curative treatment in the biomedical system. I demonstrate the work they put into achieving this envisioned societal change, to develop care infrastructures, to acquire resources and public attention, and to put palliative care on the political agenda at local and national levels, tying into a momentum of political change in Brazil. I elaborate in particular on the potentiality, future orientations, and creative approaches that enable palliative care advocates to overcome societal resistance to change and to propel the gradual integration of palliative care into the culture of death and dying in Brazil.

7490 Ghosts of Coloniality and Resistance in Youth Lives and Education

Start Date: 11/21/2025 8:30 AM **through** 11/21/2025 10:00 AM

Venue: Sheraton **Room:** Napoleon BR A3 (3rd fl)

Type: Oral Presentation Session

Looking across communities and geographies, this panel aims to track the enduring impacts and violence of coloniality and the possibilities of resistance as persistent hauntings. Engaging deeply and interepistemically across time, space, and place, the papers presented on this panel work to reveal the contours, overlaps, and reverberations of colonial hauntings and ghosts in youth's lives and education (Allweiss, 2025; Peña-Pincheira & Allweiss, 2022). Espinosa-Miñoso and colleagues (2022) explain how coloniality endures through a range of violent processes that "aim to destroy peoples' selves, their relations to each other and to the habitat" (p. xv). These violent processes operate epistemically, ontologically, linguistically, and spatially (Calderón, 2014; Fúnez-Flores et al., 2022; Lugones, 2007, 2010) through spectacular and quotidian forms of violence that are as pervasive and normalized as "el aire que respiramos"/["the air we breathe"] (Segato, 2018, p. 99).

At the same time, the papers take up the recognition that coloniality is an ongoing process, and therefore incomplete. To do so, we center the ongoing resistances and refusals to colonial violence

that aim to imagine an "otherwise" that is past, present, and future (Morrison, 1987; Rhee, 2021). Overall, the papers in this panel conceptualize coloniality and resistances to it as hauntings that are incomplete and uncontained by temporal or spatial enclosures.

Since the enduring work of disrupting these systems and their interconnections must be multifaceted in order to illuminate and create space for decolonial (re)imaginings (Espinosa-Miñoso et al., 2022; Lugones, 2003), we bring together work from different geographic locations (Chile, Ghana, Guatemala, Nicaragua, and the United States) and spaces (schools, communities, universities, and activist spaces) to make visible and collectively challenge interlocking structures and processes of domination (King, 2016, 2019). Through the examination of colonial grammars, ghostwriting, haunted pasts, haunted movements, and haunted futures, the papers in this panel show the resistances and colonial entanglements ever present in language education, mathematics education, student activism, ecological crisis and precarity haunting youth lives, and teachings through/with historic sites. Through reflective interepistemic conversations and engagements (e.g, Walsh, 2009) across geographies, this session aims to "plant seeds of coalition" across different spaces, frameworks of engagement, and entanglements (Tachine et al., 2022, p. 497).

This panel invites audience to engage with the following questions:

What different forms of imperial and modern/colonial violences and unfinished resistances haunt and persist across different times, places, and spaces?

What possibilities for understanding, thinking and doing otherwise are made visible when looking across geographies, spaces, temporalities, and colonial systems of violence and resistance?

Presentation(s): Language in/and Education: Colonial Grammars and Entanglements of a Haunted Space

This paper brings together the presenters' individual and collaborative auto/ethnographic research in K-12 schools, youth-led organizations, and universities in Chile, Guatemala, and the United States to reveal the various ways coloniality haunts language in/and education. Specifically, we draw on decolonial feminist scholarship (e.g., Lugones, 2007) to expose and disrupt colonial hauntings (Tuck & Ree, 2013) that persist in language in/and education and explore pathways for building coalition across geographies. Our work reveals ways colonial grammars are embedded in

epistemic and material violence, the rupturing of relationships based on interconnected life-affirming modes of being, and efforts to control people, land, and futures to maintain power and control that shift across time, place, and space (King, 2016). In Chile, we discuss the use, reproduction, and futurity of coloniality through nation-state symbols, religious rituals, and rote memory native-speakerism. In Guatemala, we share how Maya Chuj students and educators navigated, took up, and resisted persistent policies and practices of Indigenous language bracketing and erasure. We connect these moments and lessons to our roles and experience as teacher educators in the United States. Looking across these different geographies, we trace the conquistador-settler grammars (King, 2019) made visible when we look at language in/and education across Abya Yala and center "otherwise" possibilities.

Haunted Futures: Colonial Specters in Ghanaian Youth Experiences of Socio-Ecological Crisis

This paper examines how colonial specters manifest in youth educational experiences amid socio-ecological crisis in Ghana across three interconnected dimensions: individualization, temporal fragmentation, and moralization. I examine how the institutions and learning spaces that make up daily life for many Ghanaian youth reproduce colonial continuities in their engagement with youth about crises. The analysis demonstrates how family networks, religious institutions, and schools consistently frame crisis response through individualized moral imperatives, echoing colonial logics that emphasize personal character over structural attention. Recasting systemic failures as

personal moral challenges, educational institutions reinscribe colonial logics that also fragment collective response while reinforcing entrepreneurial, market-based "solutions" to crises. Youth engage in multiple temporalities: they simultaneously inhabit colonial pasts, precarious presents, and uncertain futures. Yet, these individualizing logics operate alongside temporal splits that separate immediate survival needs from longer-term socio-ecological considerations. The paper discusses how youth navigate these colonial hauntings as they move across different spaces, developing frameworks for understanding and living through crises. The paper traces how colonial legacies continue to shape knowledge production about socio-ecological change while highlighting youth-generated pathways toward more hopeful futures.

Presenter(s): Yaa Oparebea Ampofo

Nicaraguan Student Insurgency and Revolutionary Afterlives

This paper examines how student participation in the 2018 April Insurrection in Nicaragua was haunted by the politics of the past, particularly the specter of the Sandinista Revolution (1979-1990). The uprising was ignited by cuts to social security made by the neo-Sandinista government of Daniel Ortega, which responded by massacring protesters, often targeting popular urban barrios and rural areas. Wanton youth death at the hands of the state catalyzed demonstrations throughout the nation, with "Free country and life," a retooling of the revolutionary slogan "Free country or death," as a rallying cry. In most accounts of the uprising, students are the central protagonists, giving the protests a uniquely generational character. Forged under a neoliberal regime, the youth subjectivities that drove the protests appear to lack the (real or imagined) ideological coherence of the revolutionary past, even as most accounts look to that past to explain the uprising. In interviews, student activists narrate their mobilization in terms of opposition to an authoritarian political system and culture that they view as irredeemably corrupt. Without naming it as such, they critique the coloniality of power, expressing opposition to state violence as a mechanism of control and dispossession for those at the bottom of the social hierarchy and calling for a future liberated from the ghosts of the past.

Presenter(s): Jennifer Goett

Exorcising Ghostwriting and Immateriality as Mechanisms of Coloniality in Mathematics Classrooms

Western mathematics imposes itself as universal, dismissing alternative mathematical systems as primitive (Fúnez-Flores et al., 2024). Mathematics education often perpetuates Eurocentrism, erasing indigenous ways of knowing (Gutiérrez, 2019). This paper reimagines mathematics that "takes as a point of departure students' experiences, families and communities, and Indigenous technology" (Fúnez-Flores et al., 2024, p. 9). I argue that ghostwriting—writing a text for which the author is not credited (Gallagher, 2024)—and immateriality—overemphasis of abstraction (de Freitas & Sinclair, 2013)—are common in mathematics classrooms and perpetuate coloniality. Ghostwriting and immateriality treat children as ghosts resembling—but not really—human. Despite their phantasmagorical nature, ghostwriting and immateriality can be exorcized. In this

participatory research study, bilingual Latinx children, teachers and a researcher—all part of the Global Majority living in the United States—animated mathematical concepts and supported children in co-authoring ideas in nonnormative ways. I illustrate these processes with a third-grade multiplication lesson on El Puente de Q'eswachaka, a bridge that indigenous communities in Peru rebuild annually. The lesson favored collaboration over competition and preserved the inseparability of mathematics and sociocultural phenomena. Entanglements of bodies, materials and indigenous traditions supported the collective authoring of ideas.

Presenter(s): José Martínez Hinestroza

Teaching History as a Haunting

If we are haunted by the injustices of the past (Gordon, 1997/2008), then confronting our ghosts requires a knowledge of history and an ability to reckon with what it means for our present. Although U.S. social studies instruction is meant to support students in connecting past, present, and future, in actuality it separates time periods (Van Straaten et al., 2016) and marginalizes narratives of enslavement and colonization (Calderon, 2014, 2015; Jones, 2022; Moffa, 2022; Sabzalian, 2019). If students are not taught to make these connections, it becomes harder to recognize the ways that past injustices affect us today, thus facilitating a haunting.

Using data collected during a youth participatory action research project centering hauntings of place, I conceptualize how we can teach history as a haunting. Zembylas (2013) theorizes "pedagogies of hauntology" for history education, which can teach students to live with our ghosts rather than seek to exorcise them. Coexisting with our ghosts can lead to decolonization (Tuck & Ree, 2013).

Applied to a U.S. settler colonial context, such pedagogies can support students in connecting past to present and taking action, therefore leading them towards the "something-to-be-done" (Gordon, 2011) that haunting necessitates. If social studies education is framed through the lens of hauntology, it can shift from a repressed haunting to a "generative haunting" (Palmer et al., 2022), (re)creating alternative possibilities.

3328 Specters and Speculation: Hauntings and how they teach us about the worlds that we have, the worlds that might have been, and the worlds that must be.

Start Date: 11/21/2025 8:30 AM **through** 11/21/2025 10:00 AM

Venue: Sheraton **Room:** Napoleon BR B1 (3rd fl)

Type: Oral Presentation Session

"The ghost, as I understand it, is not the invisible or some ineffable excess. The whole essence, if you can use that word, of a ghost is that it has a real presence and demands its due, your

attention... Haunting is a frightening experience. It always registers the harm inflicted or the loss sustained by a social violence done in the past or in the present. But haunting, unlike trauma, is distinctive for producing a something-to-be-done."

--Avery Gordon, *Ghostly Matters: Haunting and the Sociological Imagination*, 2008, xvi

How do we build a way out of the various resilient modes of violence plaguing us? This question motivates each of us as anthropologists in different ways as we contend in our work with the devaluation and harm against people racialized as other, gendered and sexualized as non-normative, and overall categorized as threatening and disposable. While the master narrative of modernity is that of progression, a linear forward march to something better, how we often register the world --as things simultaneously advance, regress, and feel stagnant--is that of temporal and spatial layering. What could be most frightening in this temporal disjuncture are the specters of times supposedly past-behavior, ideologies, structures, etc., we thought we had resolved. "If there are ghosts, then what was supposed to be a New Beginning, a clean break, turns out to be a repetition, the same old story. The ghosts were meant to have been left in the Old World... but here they are (Fisher, 2013, 51)." While ghosts are most often taken up as indicators of stuckness, that is, the convergence of the present and past with a stalled future, we might also find potentiality for movement in attunements to their presence. This panel takes up this provocation as we explore hauntings not simply as communicative but as constructive: hauntings make lifeworlds and bodies just as much as they tell us something about them. Turning to state documents, colonial visual media, communal practices of remembering and re-remembering, and other forms of affective material, we ask, how do hauntings reveal the DNA of imperial, national, and local projects of delineating who is normatively human--who is to be protected --whose life and death matters? How do close readings of political projects replicating, renovating, and reasserting themselves tell us about what is necessary to sustain them and how they might be undone? How do hauntings lead us to forgotten relations, feelings, and strategies for navigating processes of dispossession? And finally, how might we carefully excavate hauntings to think not just about what is or what was, but what might have been and what could and must be?

Presentation(s): The Afterlives of the Autopsy

Clinical notations, in their meticulous accounting of death, create a particular kind of subject, one whose presence feels like absence, one whose name is carefully subverted by hollow recognitions. Medical documents contribute to the ongoing spectral presence of racial categorization. As Zakiyyah Iman Jackson theorizes, "non-representability haunts the terms and operations of hierarchical distinctions between subject and object, science and fiction, and speculation and

realism." The state performs detachment through documentation. Its administrative language can reshape how we understand and speak of Black life. This paper examines the autopsy as both a medical and a cultural artifact, focusing on its role in perpetuating racial violence against Black communities even after death. Spectacularly violated, objectified, disposable, and silenced. The violence that occurred against Black people murdered by the state is transferred to documents that further count, condemn, assess, and evoke them. What emerges is a document with a unique institutional discourse, one that can either grant or deny respect, one that makes determinations about what it means to become human.

The Batey that Haunts, that Blesses, that Calls: Bomba, Afro-Puerto Rican Emotional Histories, and Embodied World-Making

Sometimes, we feel called by the work, and at other times, we might feel haunted by it. Aisha Beliso de Jesús felt haunted and drew attention to the ways ethnographers might be impacted by their research subjects on a spiritual level. I have felt both called and haunted, or guided, during my field research and subsequent digital humanist archiving and plotting out Afro-Puerto Rican women's affective histories. Katherine McKittrick presents us with her own arguments, scaffolded by a Wynterian understanding of Black women's cartographies as "outside of the bounds of reason" (2006:25). Tiffany Lethabo King (2019) understands this presentation of demonic grounds as being able to exceed full "mappability."

In my paper, I draw on multimodal research methods: digital archiving, interviews, and dancing to articulate how an embodied approach to the question of "What are the histories of Afro-Puerto Rican women's feelings?" can help maneuver the unpredictability of opacity and imperial hauntologies. Through three ethnographic encounters, I engage in a nonlinear story-telling that is activated by epiphenomenal time in post-colonial nations to surmise how the past haunts the present so that Black woman are preparing and creating their futures.

Presenter(s): Sarah Bruno

The Idyllic, the Horror and the Worlds in Between: An Interrogation of the Power of Media Making and World-Building

This multimodal presentation takes up the visual colonial genre of the "idyllic," which is central to ongoing extraction in the Caribbean and beyond, and experiments with methods of distorting its sensory experience and authoritative power. The British archive is wrought with images of life in its West Indian colonies produced pre-independence to cultivate innocence for its regime, whereby the horrors of and challenges to its rule are masked by scenes of supposed "passive" and "happy" colonized subjects. Yet even as these visuals attempt to construct a hegemonic narrative—that Western liberal governance is ultimately civil—one can still feel something is not right: the haunting contradictions of political fiction. In this talk, I will show and discuss a series of short collage films I produced, made from layering archival photos, video footage, and audio. In these reworkings of colonial media, I amplify the eerie undertones and affective warnings of the original work in an

attempt to push the limits of what this historical material can say. I do this with the aim of remembering and refusing the attempts at colonial world-building held in these visual products. I treat this engagement with historical material as a training ground for better reading and responding to new but familiar colonial and imperial visual products presently being produced. Media that continues to seek to constrict our understanding of the workings of power and our capacity to imagine and enact freedom

Presenter(s): Leniqueca Welcome

Obituaries and Other Minor Genres

Arguably one of the most horrific and ongoing catastrophes haunting queer life, and by extension queer worldbuilding projects, in the United States are the violent, targeted, and largely unsolved murders of predominantly black and brown trans women. As a response to the catastrophe, queer activists, artists, and scholars have reached for the tools available to fight against the systemic violence undergirding American political, economic, and social life. But are these tools—the ones made available in and through a liberal form of life—sufficient for combating anti-trans violence? This talk explores the obituary as one of the "tools" people have taken up in the fight against a world in which the murders of black and brown trans women have become horrifically ordinary. While the obituary is a relatively minor genre in the political, social, and theoretical struggle for trans and queer liberation, I argue that its use and function nonetheless open up a series of questions worth asking about how we theorize and respond to anti-trans and anti-queer violence and tragedy. Using some of the rituals for mourning developed in the ballroom scene as a foil to mainstream LGBTQ+ political movements, I show how struggles to be included in certain genres limit our capacity to break out of the very systems and structures that created the catastrophe in the first place.

Presenter(s): Emily Bock

"All the Ways We Can Die, But We Don't": Making Life in the Haunting

This paper opens the sociological concept of "haunting" (Gordon 1998) to the transgenerational, embodied experiences of Black women. While Gordon theorizes that something lingers from the indescribable violence of enslavement, I argue that her theorization does not fully encapsulate how the haunting & the haunted of slavery are inscribed onto Black people's bodies, which are not unfamiliar to home but are essential to its construction. I build upon Spillers (2003 [1987]), duCille (1994), Hartman (1997; 2008; 2016) and others to describe Black women's social position as the haunt: the figure that causes much distress and worry, that troubles, yet is critical to the social fabric of this nation. Utilizing Toni Morrison's method of "rememory" -- "recollecting and remembering as in reassembling members of the body, the family, the population of the past" (2019: 324) -- I aim to reassemble and to mark haunting at its embodied site(s), through the tracing of scars left behind by interpersonal and anti-black violence perpetrated over generations. Through a critical Black feminist reading of ethnographic interview data and Gayl Jones's *Corregidora* (1975), I examine themes of haunting, reproduction, violence, and slavery's afterlife to illuminate the haunted-haunt-haunting bind. Within this bind, I ask: How does one make life at the intersection of

being the haunt while being haunted by legacies of structural, institutional, and interpersonal violence?

3588 Ghostly Translations: Apparitions and Power in Ethnographic Reading, Writing, and Research

Start Date: 11/21/2025 8:30 AM **through** 11/21/2025 10:00 AM

Venue: Sheraton **Room:** Napoleon BR B2 (3rd fl)

Type: Roundtable/Town Hall

This roundtable addresses the ghostly aspects of translation. Reading, writing, and research in anthropology are all influenced, more or less, by apparitions ranging from anthropological ancestors, to the colonial past, to haunted memories of spirits in the field. Who speaks for whom in translation? What is being translated? What are the ethics of translation? At stake are issues of power, inclusion, and equity. Ethnographic research has been described as a process of cultural translation, but it also entails linguistic translation. Translation bears the ghostly presence of the original author or speaker as well as the translator. The translated versions of a field narrative, a theoretical idea, a text, and even a life provoke considerations of equity and justice. As Martiniquan writer Chamoiseau (2024) has put it, his life was "under translation": "I had to translate my entire existence into French, under the threat and fear that the latter engendered." Translation in its various forms has been debated. Cultural conceptualizations, let alone metaphors, can be misunderstood and meanings can get lost in translation. Viewing anthropology as cultural translation risks essentializing a society, and linguistic translation risks losing nuance. At the same time, however, translation can be a creative, illuminating, and liberating act whereby much is gained even in the presence of the ghostly thing(s) translated. Reading itself may be a conduit for translating the emotions, ideas, and meanings of an author into a transformed sense-making for the reader. Hannerz (1993) suggests that the translator may either convey meaning in a literal "impartial" way, or to be more creative, "to respond in aesthetic and intellectual terms both as a reflection of the original work and as a work in its own right." With respect to cultural translation, Clifford (2013) notes that "the theory/metaphor of translation keeps us focused on cultural truths that are continuously 'carried across,' transformed and reinvented in practice." As Behar (2020) has observed, she and the Mexican woman Esperanza whose life story she recorded, were involved in a mutual cultural and linguistic translation: "We were two translated women. She was translated in one way, I was translated in another." The discussion of past, present, and future issues in the relationship between anthropology and translation fostered by this roundtable will facilitate reflection on methods and uses of translation in the contemporary world. Earlier questions of what is "lost" in translation when we want to convey meaning are now joined by new ones arising from the increasing use of technologies such as AI that perform or assist with translation. This modern "ghost in the machine" evokes both enthusiasm and anxiety -- as a potentially helpful tool that may be a hindrance to creative and meaningful translation that is, as Apter (2021) proposes, "just."

2978 Death, Ghosts and the Afterlife in Asia

Start Date: 11/21/2025 8:30 AM **through** 11/21/2025 10:00 AM

Venue: Sheraton **Room:** Napoleon BR B3 (3rd fl)

Type: Oral Presentation Session

This panel seeks to investigate the continuity and innovations in death rituals including funerary practice, ghost possession, war commemoration, and end of life care in various contexts across Asia. Within the understanding of the role of death in political, economic, and social spheres, we observe numerous instances of the continuity of the social fabric within death rituals and conceptions of the afterlife. However, with the rise of technology, increased migration, and evolving notions of what constitutes a "modern life" or a "good death," many traditional practices are undergoing rapid transformation. Ethnographic and historical investigations into how individuals are adapting to these changes can enrich our comprehension of the significant social, economic, environmental, and political shifts in our time.

End of life care and death rituals as well as the associated financial and legal context supporting funerary infrastructure are key sites that shape the transition at the end of life for the dying and for the bereaved. In turn, perceptions of what constitutes a good death are often directly reflected in our views of order and morality concerning the afterlife world, which includes ghosts, ancestors, and other spiritual beings. These changes illuminate how individuals navigate evolving environmental, social, political, and economic landscapes, while also unveiling the power structures that govern perceptions and practices related to death across Asia.

Presentation(s): Hinging the Afterlife: Trusts and the Zoroastrian Muktaḍ Ceremonies

Charitable giving is one of the pillars of Zoroastrianism, where the acquisition of wealth is righteous if earned honestly and shared liberally. Conducting charity is practiced at all class levels of the Parsi (Indian Zoroastrian) community in Mumbai, and is incorporated into several ritual practices such as annual muktad remembrances for the dead. It is at these rituals wherein the souls of deceased kin (fravašis) are called down by name for feasting and convening with their living families on earth, that future charitable intentions are often announced. While the muktad rituals reconvene the living and the dead annually, the charitable trust is the formal legal mechanism, which hinges this cosmological cycle of giving in the realm of the worldly, perpetually. Not simply analysing the trust as an econo-legal mechanism, this paper will investigate the trust as part of ritual practice through the metaphor of the hinge.

Presenter(s): Leilah Vevaina

Communicating Presence: Synchrony in Funeral and Commemorative Ritual in Rural Sichuan, China

This paper critiques the notion of belief as an atemporal category, instead positing that life-cycle events and ancestor worship in rural China betray a deep-seated awareness of the social world's temporal contingency. These events are not about fixing or reiterating cosmological truths but about synchronizing action for a righteous purpose. The use of symbols like firecrackers, fenpiao, spirit money, and grave carvings underscores the visibility and communicative intent of these performances. Ultimately, practices of genealogical recognition reaffirm or question communal vitality as a transient living form with a knowable past but contingent future. By examining these events through the lens of performance dynamics and a pervasive concern with face, this paper offers an understanding of how human connection is continuously negotiated and reconstituted in the face of irreversible time. Ultimately, rather than 'resolving' transience, acts of filiality only point at the possibility of genealogical continuity. By doing so, the emphasis on acting out connection leaves ample space for ambiguity with regard to what is known about it. The transcendence of a self-same and temporally bounded individual is in the final instance left opaque and the gap with the other only ever bridged through performative gestures through which self, other, and audience "play" each other's presence without presupposing or claiming ontological certainty.

Presenter(s): Angel Nayden

National Heroes in Bad Death: Ghost Narratives in WWII Commemoration in China

Drawing from ethnographic fieldwork, content analysis, digital ethnography, and oral history, this study investigates the significance of ghost narratives within a historical redress movement seeking justice for marginalized fallen soldiers in the national commemoration of the Second World War in the People's Republic of China (PRC). The research frames war commemoration as a mechanism reinforcing the hierarchical order of the deceased. While the state employs these commemorative practices to assert its legitimacy and moral authority, the lived experiences of local activists engaging with the marginalized war dead reveal dynamic interactions with established top-down remembrance structures. Through the lens of ghost narratives, activists highlight disparities in

mourning practices and the injustices stemming from political violence against stigmatized fallen soldiers. The resultant emotions of anger and guilt propel local actors towards participation in initiatives such as exhumation, repatriation, and restoration projects for these marginalized spirits, leading to a sense of empowerment while inadvertently perpetuating the hierarchy of the dead within nationalist frameworks. Furthermore, within grassroots commemorative settings, the newly established connection between the living and the dead facilitates the transmission of memories concerning political violence against the fallen, enabling the reclamation of memorial spaces and the regionalization of war memories.

Iblīs/Ghost Possession as Familial, Economic, and Political Discontent among Chinese Muslims

The Qur'ān refers to invisible creatures capable of both good and evil, and of possessing and sickening humans, as jinn, with the most rebellious ones called shayāṭīn (plural of shayṭān). The proto-Shayṭān is Iblīs, who refused Allāh's order to prostrate before 'Ādam, was expelled from Jannah, and deceived 'Ādam and his wife into tasting of the forbidden tree. By contrast, Hui people (Chinese-speaking Muslims) cohabiting with Han Chinese and Tibetans in Northwest China use "Iblīs" as an umbrella term, conflating it with ghosts (gui) or untended spirits and souls in Chinese cosmology, and ascribing varying degrees of evilness to Han, Hui, and Tibetan Iblīs/ghosts. Women experiencing pregnancy, abortion, and miscarriage often report emotional instability, spiritual weakness, and being possessed (shangshen) by Iblīs/ghosts when their husbands return home after socializing or lose their temper. Low-income farmers and workers tend not to visit doctors, instead attributing death and diseases like COVID-19 infection to being haunted (naogui). Dissidents dub the regime "the largest Iblīs/ghost," accusing "the specter of Communism" of haunting Muslim life and afterlife. Drawing on fieldwork with these people, this study examines how Iblīs/ghost narratives mediate familial, economic, and political discontent among Muslims in rapidly changing Chinese society, who deem Islamic piety an antidote to family disharmony, poverty, oppression, and spiritual attacks.

Becoming Two After Death: Postmortal existence in dual cosmologies in Tibet and apotheosis of heroes accelerated by the PRC occupation

'This is the thangka image of my father, he is a deity now'. A traditional chieftain in East Tibet shares a photograph of his father, now a territorial mountain deity and also a Buddhist reincarnate in the body of his own monastic grandson.

The liquidation of elites during the violent takeover of East Tibet in the 1950s generated a recurring heroic narrative about traumatic deaths: some prominent figures became deified. Buddhism has in fact in all cultures coexisted with another religion or cosmology. Although it has since its beginnings aimed at monopolising death rites and the interpretation of afterlife based on the morality reincarnation principle, it has not entirely succeeded. In Tibet, an individual can gain two kinds of rebirth: a Buddhist one (or more) through consciousness and another one through a vitality

principle within a local cosmology of mountains and ancestors tied to the ecological environment and traditional socio-political elites. The PRC presence and acts have pushed towards strengthening the latter, a solidification of local identities of shattered Tibetan polities, traditional knowledge loss, and an alternation of the related burial practices.

The apotheosis of important individuals not only enables a constant enlargement of local divine pantheons but also interacts with the Buddhist reincarnation principle and pattern. The outcome is a socially prestigious dual postmortal existence in which an individual succeeds in both cosmologies simultaneously.

3575 Ancestral Ghosts and Ghostly Ancestors in Contemporary China

Start Date: 11/21/2025 8:30 AM **through** 11/21/2025 10:00 AM

Venue: Sheraton **Room:** Napoleon BR C1 (3rd fl)

Type: Oral Presentation Session

Throughout history, both "ghosts" and "ancestors" have taken shape and continue to emerge as important sites of meaning-making in Chinese families and Chinese society more broadly. Both refer to the spectral traces of those who have come before, and both are entities with whom the living can experience a relationship of "resonance and response." Indeed, ongoing communication between the living and their deceased ancestors is often seen as a preventative measure, satisfying the ancestors enough so that they do not become the kinds of vengeful or "hungry" ghosts that wreak havoc in the world of the living.

Looking beyond conventional imaginaries of kinship and human-ghost interaction in contemporary China, the papers on this panel work towards the development of a phenomenology and semiotics of ghosts and ancestors in China today. Across our papers, we specifically seek to productively unsettle the boundaries between past and present, personal and political, and religious and secular realms. Our ethnographic interrogations examine the presence, purpose, and practices of "ancestral ghosts" and "ghostly ancestors" in various urban and rural settings throughout China, including a large Buddhist temple and second-hand markets in Beijing; family grave sites in rural Shanxi; and a county-level middle school in Southwest China. We address the following questions:

- How do ghosts populate everyday life in contemporary China? Where, when, and how do they reveal themselves? What knowledge or experience is required in order to "read" them in images, sounds, material objects, bodily sensations, or states of mind?
- How and why do people communicate with ghosts and ancestors? What, where, and who are the mediums through which such communication occurs?
- What is the purpose of such communication? What desires or aspirations ground it, and how does it contribute to everyday forms of relationality?

- To what extent does (unspoken) historical, social, or political trauma emerge in the form of "ghosts" or "ancestors" in contemporary China?
- What is the moral and emotional tenor of communication with ancestors and/or ghosts in contemporary China? Where, when and by whom does engaging with ancestors/ghosts feel like spiritual reverence, a burden, or a form of intimacy and joy?
- What space-times are occupied by ghosts and ancestors? How are such space-times understood in relation to social realms such as religion or politics? How are these space-times accessed by Chinese citizens in various contexts and over time?

These questions are especially pertinent in the contemporary Chinese context, marked by recent demographic shifts such as declining birth and marriage rates and population aging; massive changes in the organization and distribution of power in the family; and the ongoing repression of serious public engagement with troubling political histories.

Presentation(s): Spirit Possession? Shifting Ontologies of Ghost Belief in a Chinese Buddhist Community under Secularism

Based on fieldwork at a Buddhist temple in Beijing, this presentation explores two stories of ghostly encounters to consider how experiences with the supernatural expose cracks in the boundaries between secular and religious, public and private, and internal fears and external behaviors. In one case, after ridiculing a ritual to appease hungry ghosts (gui), a temple visitor was followed home by a ghost, leading her to frantically recant her moment of disrespect and seek an exorcism. In another case, adherents begged a popular monk at the temple to help exorcise spirits (futi) that they believed were causing them stress, paranoia, and depression. A graduate of the National Buddhist Academy of China, the monk was deeply influenced by a secularized approach to Buddhism as a philosophy that offered liberation to its adherents through the mastery of "no-self" (wuwo) rather than as a religion that trained its clergy to control occult forces. Yet, faced with the adherents' persistent requests, he eventually took his own "ontological turn" by concluding that the spirits were real as long as the adherents under his care believed they caused suffering, and he explored ways to take their problems with possession more seriously. In both cases, ghosts and spirits functioned to blur the boundaries between the religious and the secular in urban space, served as mediums to bring unspoken private problems into public light, and provided justifications for unacceptable behaviors.

Presenter(s): Gareth Fisher

Between Material and Spectral: Rethinking Ancestral Presence through Grave Goods in Rural Shanxi

Based on ethnographic research in rural Shanxi, China, this paper challenges conventional understandings of the "parallel worldview" in Chinese cosmology through an examination of grave goods practices. Rather than reflecting a straightforward mirroring between human and ancestral realms, I argue that funeral garments and paper offerings reveal a more ambiguous, negotiable boundary where uncertainty and innovation coexist with tradition.

I focus on women's practices of creating "longevity clothes" and other funerary objects within patrilineal structures. These material engagements transform the preparation for death into a form of intergenerational care, as elders craft their future ancestral identities while reducing anticipated burdens on descendants.

What emerges is a distinctive engagement with ancestral presence characterized by the paradoxical coexistence of reverence and playfulness. As residents incorporate modern elements into offerings and share humorous narratives about "wild ghosts," they acknowledge death's fundamental unknowability while maintaining material connections across cosmological domains.

Taken together, this anthropological study reveals how contemporary rural Chinese navigate ancestral presence not through fear or obligation alone, but through practical, flexible, and sometimes playful material practices that simultaneously honour tradition while creating space for negotiation and change.

Presenter(s): Yuan Zhang

Ghostly Paths of Secondhand Things: The Powers and Potentials of Object Biographies in Beijing

This paper explores the value and affective dimensions of the secondhand economy in Beijing. At the heart of this investigation lies the concept of *lai lu bu ming*—"the path of origin [of something/someone] is not known"—which condenses the ambivalence many of my interlocutors expressed toward material things previously owned by strangers. Like ghosts, who are figured as potentially dangerous strangers in Chinese popular religion and can affix to material things, secondhand goods also carry contagious qualities or social entanglements with unknown others that can provoke anxiety and hesitation.

Yet for others, the very same usedness is highly valued as a kind of social and historical richness. Dealers of used goods, who rely on the value of secondhand things in the marketplace, must brighten the unknown past paths of used goods in order to assure customers. Some even project a trajectory for their wares into the future, reframing the sale and recirculation of used items as a cultural and emotional inheritance or a kind of non-familial kinship, emphasizing an ethic of continued circulation and appreciation rather than letting good things go to waste. By attending to the parallels between ghost/ancestor and stranger/kinship relationships alongside the perceived contagion/appeal of secondhand things, this paper articulates a resonance between popular religion and everyday material practice.

The Intergenerational Haunting of Anxiety over “Salvation Through Education” in a Southwestern Chinese County

This paper examines how anxiety over (un)fulfilled educational aspirations becomes ghostlike, haunting multiple generations amidst rapid social change. Based on fieldwork conducted in a county seat in Southwest China from 2023-24, I explore a common predicament among teachers and parents who, despite their own exhaustion as active participants in educational competition, lament their middle school students' and children's declining motivation compared to previous generations. Drawing on interviews with ten middle school teacher-parents, this paper traces how an anxiety over "salvation through education" persists beyond its original political-economic foundations. Rooted in their ancestors' traumas of poverty and political stigma, this inherited anxiety continues to demand salvation from teacher-parents who have already lifted their families out of hardship through educational success. It further drives them to impose the same aspirations on their students and children growing up in a booming economy and receiving far more intensive schooling—conditions that render such anxiety over salvation increasingly unnecessary and unsustainable. As a result, many of these teacher-parents recount painful adjustments to their expectations after school-related physical and mental issues and domestic conflicts occur to their children and themselves. In light of these narratives, this paper reflects on the potential unraveling of this intergenerational haunting and the human costs involved.

7827 Empire and its Haunts

Start Date: 11/21/2025 8:30 AM **through** 11/21/2025 10:00 AM

Venue: Sheraton **Room:** Napoleon BR C2 (3rd fl)

Type: Roundtable/Town Hall

In this roundtable, we explore the various manifestations, impacts, and resistances to colonial and present-day empires, as well as the rationalities that undergird disparate manifestations of the imperial. Through examining specific tactics and logics of empire in various locales and time periods, we draw attention to the "ghosts" of empire - the often unseen, unsettled, and unfinished ways that past policies of empires continue to haunt present-day economic, political, and social landscapes.

By examining the ramifications of empire, our roundtable participants invite a discussion foregrounding the centrality of the imperial in people's everyday lives while simultaneously challenging reified understandings of empire as a concept. Our presenters interrogate the current-day material manifestations of empires in plantation agriculture, armed conflict, emerging and long abandoned extraction zones; the genealogy of "imperium" as the modality of power undergirding of Western imperial formations; and the ways the recognition of empire is masked in imperial cores.

This round table moves beyond an understanding of empires as stagnant, all-consuming entities to unpack how empires are simultaneously formed, reformed, contested, and acquiesced to both across time and place. Drawing from scholars of state formation, we are less interested in an immovable definition of empire, and more in search of the complicated and historically rooted ways that empire-making has been threaded into the banal interactions of daily life. Central to our discussion is the role of shifting political economies and forms of power in masking broader acknowledgement and awareness of the work of the empire. In paying attention to how empires function and who comprises empires (governments, civilians, or both), this round table also addresses the difficulties inherent in confronting and dismantling empires.

Key Questions for include:

- -What are the impacts of empire in discursively "post-colonial" societies?
- -In what ways have empire and Imperialism been remade to continue to haunt both the colonized and colonizers?
- -How does the empire's invisibility influence how it is understood and resisted?
- -How has the discourse of "empire" prevented us from conceptualizing "the imperial" as a modality of power?
- -In what ways have empires reshaped peoples' relationship to and understandings of land and nature?
- -How do people engage with, adapt to, and contest legacies of imperialism in their everyday lives and aspirations for the future?
- -How have empires built relationships with minority communities, selectively "uplifting" and subjugating them and how have minorities supported and resisted imperial endeavors?

Through our interrogation of empire we hope to contribute to broader discussions about neoliberalism, territorial and power ambitions of empires, and decolonization, while also suggesting new pathways toward resistance and liberation.

7100 Haunted Futures: Relationships, Collectives and Places

Start Date: 11/21/2025 8:30 AM **through** 11/21/2025 10:00 AM

Venue: Sheraton **Room:** Napoleon BR C3 (3rd fl)

Type: Oral Presentation Session

Landscapes are haunted by the ruins of progress and its promises – tales of collapse, extinction, and exhaustion. Yet, both the dead and the undead are resuscitated by cycles of history and projects to revive and renew what was once buried underground. How are futures then recast by

these haunted projects and cycles? What ghostly forms appear as futures when we direct attention to how the past is made to live in the present? And crucially, what forms of relationality emerge between past and present that may gather in future assemblages? Given the pervasive haunting of colonial legacies, how do actors in various places confront the undead or negotiate their presence? This panel attempts to inter "progress," to mute its metronomic effects, so as to clear air for excavations of the dead and undead. We not only track and trace people, places and things that haunt, but pursue haunting as temporal method for unsettling presumed tomorrows. The "arts of noticing," as called for by Anna Tsing (2015), thus can draw upon more than a present tense that swells and suspends. It can draw upon the past to enliven the present with spirits, projects, music, homes, forms of care and solidarity. The panel interrogates ghostly, peri-capitalist incarnations that forge tension, gesture toward relation, and offer means for otherwise being in the here and now. Specifically, we unearth material specters of the good life, such as those that haunt log cabins of Tennessee and their capitalist appropriation for escapist futures. We excavate traditions of neighborly relation in Tunisia that scaffold urban survival even as these relations are sites of capture by social media corporations. We conjure the colonial ghosts of anarchist pasts as they disrupt coordinated punk futures in Indonesia. And we disinter specters of past failure and disillusionment in Lebanon as these haunt current caring practices and uncertain futures amid ongoing war and displacement. In these disparate sites, ghostly pasts shape relationships, collectives, and places, spilling out of the present into haunted futures.

Presentation(s): Punk Futures, Anarchist Vacations, and the Ghost of Colonialism Past

For the last twenty years or so, Indonesia has been home to the largest and most active punk scenes in the world. A small yet highly influential subset of these scenes are anarchist punk collectives in urban areas which have steadily grown in popularity. These collectives offer a place where folks who are disillusioned with the false hope of an expanding consumer class and dissociated by the nation-building project of Indonesia can forge new realities extending beyond imposed conditions of living. Through 'worlding from below' collectives' global networking predicated on anarchist and DIY principles actively create alternative futures to predatory capitalism and mindless nationalism thereby resisting dominant power structures—or at least that is how the anarcho-punks envision things.

In this paper, I focus on an annual anarcho-punk music festival, Libertad, organized by a collective operating in Bandung, Indonesia. For organizers, Libertad is viewed as an opportunity to assert their

place in the global punk scene while promoting anarchist ideals of mutual aid and solidarity. However, tensions emerge when European and North American punks treat the festival like a tropical Sandals resort, expecting local punks to enable their booze-fueled escapades with little regard for the ethics and ideals on which the event is built. I explore the global power dynamics at play in punk tourism revealing that even anarchist futures are haunted by the lingering specter of colonialism.

Log-Cabin Fantasies in Gatlinburg, Tennessee: Salvage and Translation of the Domestic Appalachian Idyll

Gatlinburg, Tennessee, (pop. 3,577) is a gateway community to the most visited national park in the United States, the Great Smoky Mountains. Here, the "log cabin" is a key symbol for tourism; a mascot used to sell everything from pancakes to putt-putt golf. Thousands of log cabins sprout from Gatlinburg's forested hills, each built to accommodate tourists who come to sip moonshine, hike mountains, or explore Dollywood. Despite the abundance of cabins, Gatlinburg's residents live with housing insecurity. As one resident noted, "It's not that we don't have enough houses. It's that we don't have enough places to live." The growth of short-term rental apps (AirBnb and VRBO) has heightened the intensity of cabin construction and the rate at which long-term housing is converted into nightly accommodation. This paper examines the log cabin as a site of salvage, where capitalist accumulation occurs through processes that are not entirely controlled by capitalism. Tourism discourse is haunted by the specter of pre-capitalist life, wherein the "log cabin" is imagined as a harmonious site of integration between work and home. Yet the maintenance of touristic "log cabin" discourse requires not only alienated labor and commodities, but also residential displacement. What haunted futures are conjured by the "log cabin" as it is salvaged and translated into a short-term domestic commodity?

Presenter(s): J. Hope Amason

Ghosts of Time, Care and Connection: Haunting Transactional Futures in Tunis, Tunisia

This paper explores how traditions of neighborly relation in Tunisia haunt urban relations in Tunis, Tunisia and the entangled relational futures of online social media. Some residents of Tunis describe the city as a non-place or as a nowhere. The perceived anonymity of the city contrasts sharply with emplaced social connection in small towns. In spite of much change, town households more commonly share food, and women sit outside homes in the evenings to gather and chat with neighbors. But for urban residents in my field site of Hay Ettadhamon (Solidarity District) – the most densely-populated collection of low-income neighborhoods in Tunis – financial duress shapes the terms of neighborly relation and local friendships. High rents, high electricity bills, and low pay push people to undertake small-scale lending and borrowing, including with people they don't know well. These transactional bonds, fueled by financial exigency, are further reflected in social media use. The emergence of widespread social media use established local digital traffic by incorporating existing urban relationships of solidarity into social media platforms.

As Facebook use has developed over the past 10 years, residents increasingly use online profiles for entrepreneurial purposes, generating cynical opportunism about relational futures. The paper shows how memories of care, of time, of connection with family and neighbors in hometowns haunt transactional encroachment on urban relation.

Presenter(s): Karem Said

Caring and Connectivity in Lebanon between Haunting Past and Uncertain Futures

This paper examines how narratives about the past and the future foster competing imaginations of care and connectivity in Lebanon, specifically in the context of war experiences and grassroots care practices during the 2024 Israeli invasion of the country. Between September and December 2024, over a million people—primarily from Shi'i communities—were displaced across Lebanon, while thousands of Lebanese sought refuge in neighboring countries. Although many Lebanese elites were alarmed by the crowding of Beirut's shelters and streets, various local communities and activist groups stepped in to support the displaced individuals. They fostered new relationships through humanitarian assistance and other forms of care. What kinds of pasts and futures do these caring practices invoke in the face of shock, devastation, grief, and loss? How do diverse residents relate to each other amid protracted wars and crises? I situate caring practices in Lebanon within postwar histories of activism and struggles related to national identity and belonging. I show how caring relationships generate lifeworlds haunted by complex narratives of both the past and the future. Engaging with the profound impacts of an ongoing war enabled many to tackle uncertain futures by forming new connections and claiming agency. Yet, the past—marked by "failed projects" and associated feelings of disillusionment—haunted these engagements.

7355 Contours of Ghosts: Recognizing the Past and Creating Old Futures

Start Date: 11/21/2025 8:30 AM **through** 11/21/2025 10:00 AM

Venue: Sheraton **Room:** Napoleon BR D1 (3rd fl)

Type: Oral Presentation Session

Seeing is believing. But if so, how do we make sense of ghosts? Are they truly seen? Can they even be visualized? The pursuit of rendering the spectral visible illuminates not only the past but also the future. Ghostly contours might emerge by tracing often hidden, lasting structures, yet they should remain visible to those who come after. This panel explores various visualizing methods from technologically driven approaches such as facial recognition systems, live streaming, and paranormal equipment, to more traditional practices like portraiture and symbolic representations through demonic or animalistic tropes.

These visualization processes reveal a complex interplay between recognition and reconciliation, as each, with its own fixed point, oscillates between realms of knowing and not knowing. Such oscillation allows ghosts and the spectral to function as historical and imaginative forces, framing

ongoing conversations about haunting issues. Eom explores "haunted historiographies" shared by Indonesia and Korea under Japanese colonial rule through the discovery of a Japanized Korean soldier's grave and portraits of comfort women in a "house of ghosts." Choi examines epistemic anxiety in rendering ghosts into a quasi-material construction through live-streaming ghost hunting in South Korea. Zhao shows that the spectral representations of national enemies with demonic and animal tropes can contribute to producing public discourses on national security and justify the state's sovereign interventions in crimes and misconduct. Bulelani's work on Kenya, Ethiopia, and South Africa shows that by adopting Chinese facial recognition technologies, governments not only surveil their populations but also predict criminality using images of past criminals, whose legacies continue to haunt the present. By highlighting various pursuits to visualize the ghostly within ethnographic sites, this panel examines how making the invisible old visible enables the recognition and transmission of memories from the past for future-making-memories once suspended between the individual unconscious and collective reality.

Presentation(s): "Do you believe?": Science, Shamans, and Epistemic Anxiety in South Korean New Media

This paper examines the intersection of new media and "anthropology of ghosts" through a case study of the South Korean live streamer Yoon Si-won. Yoon has attracted a large viewership through his wide array of horror-related content including interviews with mudangs (Korean shamans) and real-time ghost hunting. In his streams, the existence of ghosts and spirits is uncontested; folklore equates history. Characteristic of his live-streaming is his use of "scientific" equipments, such as EVP recorders and infrared cameras. As Dylan Anderson analyzed for Anthropology News, such usage of technological tools by paranormal investigators attempts to "materialize the unmaterializable" by rendering ghosts into a quasi-material construction, and technology into a symbol of intellectual authority.

What, then, could be made of the regular presence of (self-proclaimed) mudangs in his investigations? How does the apparent objective authority of scientific empiricism coexist and contend with the subjective authority of spiritual privilege? How do these questions come into play with the invitation to skepticism enabled by viewer chatrooms and real-time streams? What kind of epistemological contest is being put on display, and what might this tell us about the creation of folklore, proof, and "truth" in the sphere of new media--and their shakiness?

Presenter(s): Min Ji Choi

Revisiting the Dead: Haunted Historiographies Between Indonesia and Korea

From pilgrimage to dark tourism, the dead can reveal more than the living ever could, providing an infinite source of stories that sustain potent afterlives. This paper juxtaposes two such afterlives to foreground the ambiguities and interstices that haunt the discourse of postcolonial historiography. First, it traces the discovery of a Japanized Korean soldier's grave in Indonesia in 1975. His interpellation as a posthumous Indonesian independence hero and subsequent reclamation of the soldier's identity as an ethnic Korean, highlight the transnational imbrication of lives and deaths following the deployment of colonial subjects during the Asia-Pacific War. The second part contrasts this military history with the dimming legacy of gendered violence through the "narrative experience" of an Indonesian feminist activist, who created 53 portraits of her elderly neighbors, former comfort women, while caring for them. The act of drawing released the trauma extended to her and transformed her home into both an art studio and a spiritual refuge—a "house of ghosts" whose voices might get lost by historical amnesia and nationalist historiographies. These instances of "haunted historiographies" illuminate how spectral memories of war, empire, and resistance intimately entangle Indonesian and Korean postcolonial presents, blurring the boundaries between us and them.

Presenter(s): Gangsim Eom

Between Dependency and Independence: African Agency Amid China's Expanding Digital Footprint in Africa

Digital technology is often regarded as a neutral instrument—a functional conduit that automatically realizes predefined ends. Contrary to this supposition, I explore digital technology as a cultural artifact, one that reflects and refracts values embedded in African postcolonial societies. Specifically, I interrogate the politics of faith in the technological fix as a solution to longstanding, and often spectral, challenges inherited from the colonial encounter. My focus is on facial recognition technology, which exemplifies the Kenyan state's most ambitious efforts to enhance its capacity to uphold social order and catalyze development. Yet, these technologies also provoke deep concern—particularly given their procurement from Chinese vendors—about their potential to facilitate espionage, bolster authoritarian governance, and expand Beijing's imperial reach across the Global South. Broadly, there has been a persistent tendency to read the present as a moment of rupture or rapture—a pattern especially pronounced in imperial narratives. The rise of advanced digital technologies, paired with China's growing geopolitical presence in Africa, is thus framed both as a harbinger of freedom—a long-awaited emancipation from underdevelopment—and as a forewarning of a techno-authoritarian future marked by the banality of mass surveillance. Moving beyond these dualistic framings requires inquiry into how surveillance tools are embedded and contested.

Presenter(s): Bulelani Jili

Animals with Parents: The Queer Kinship of China's Contemporary Body Politic

Over the recent decade, animal metaphors have emerged collectively in China's public and state discourses to characterize and categorize particular social groups—state officials, educators, consumers, or bachelors and bachelorettes. For instance, the wildlife of tigers and snakes index corrupted officials that the current state leadership deem as national enemies that need to be caged. Demonic beings with superpowers, such as the Wolf Man and Aquaman, index educators committing sexual harassment and swindlers committing love-for-money cons. Domestic ones, dogs, pigs, and fish, respectively, index undesirable bachelors, self-indulging consumers, and victims of financial or sexual offenses. Meanwhile, kin terms are adopted to register national role models, including President Xi Jinping as "elderly uncle Xi" and the First Lady as "mom Peng." This presentation explores these registers' pragmatic usages in urban conversations, TV shows, and political speeches. It further maps out a queer kinship of contemporary China's body politic. The emerging political kinship and its animalistic and demonic alterities will reveal who the current state deems as reproducible and relatable kin, who can be regenerated or humanized, and who have to be caged for regime stability. In doing so, the presentation opens up anthropological imagination for socio-political becoming and national future-making.

3224 Sonic Infrastructures and the Materiality of Power

Start Date: 11/21/2025 8:30 AM **through** 11/21/2025 10:00 AM

Venue: Sheraton **Room:** Napoleon BR D2 (3rd fl)

Type: Oral Presentation Session

Discussions of sonic infrastructure usually focus on music, media, and their material production. In this panel we recognize a broader range of material substances that mediate and mobilize power and sentiment through sound, including cruise ships, dwellings, cows, and human bodies. Infrastructures often underlie and naturalize hierarchies of power; our panel pays special attention to colonial and imperial histories in the movement of sound and substance. We consider how infrastructures connect the micro-level of bodies and emplacement to macro-level systems of power and movement. We build on recent work that has brought the anthropology of infrastructure into the aesthetic and sensorial realms. For Brian Larkin (2013), infrastructures are things and the relations between things. They move and mediate things that are both concrete and abstract--structures and ideologies. Different material structures produce different ambient conditions and sensorial experiences. Infrastructures often operate outside of awareness, though they are not necessarily invisible. While infrastructures are often forward looking, they also carry historical forces into materialities and imaginations. For Kyle Divine and Alexandrine Boudreault-Fournier (2021), "auditory infrastructures" are about music's material bases; as such, they invite the exploration of the correlation between natural resources (upon which such a material base is built) and aesthetic practices. Though our panel is not limited to the musical commodity as an object, we note the recurring theme of "surface" aspects (i.e., actual sound) in contrast to deep aspects of

music making through material infrastructures, often large-scale ones upon which the very circulation of sound is based. In conceptualizing this panel, we want to point out that since the connection between these surface and deep elements is often not obvious, the very condition of audibility becomes a problematic to be explored. The ethnographic and historical studies in this panel consider a range of sonic infrastructures across four continents. Panelists discuss the sensorial, cultural, and material dimensions of infrastructures that fall apart through economic decline or environmental disasters; infrastructures of natural and supernatural mediations; and infrastructures of peripheral networks related to tourism and war. In these studies, sound and the sensorial are not detached as musical commodities, but rather embedded in densely woven materialities, ideologies, and experiences.

Presentation(s): Colonial Acoustics: Sound, Spirituality, and the Built Environment in Antigua, Guatemala

What is the relationship between religious architecture and ontology as an infrastructure for empire? It is well known that religion was an arm of the Spanish empire, and that monumental architecture reflected and shaped political power, but how did this take place at the level of the body, voice, and spirit? The close economic and social relations between church institutions and colonial settlers manifested in nuns' spoken and sung prayers to facilitate benefactors' entrance to heaven (Burns 1999). The materiality of convents reproduced class divides by distinguishing between nuns of the black veil (educated, often noble women who were prayer and song leaders as well as administrators) and the white veil (illiterate members of the servant class, often Indigenous). Exploring the sonic relations of bodies and buildings, this paper considers Antigua, Guatemala, a planned city with orderly blocks periodically damaged by earthquakes, which ultimately led to abandonment in 1776. Whereas cities of continuous habitation get torn down and rebuilt bit by bit, Antigua heritage discourses present the experience of a colonial city through ruins and reconstructions. The paper argues that colonial religious architecture encapsulated Baroque cosmologies and sensorial regimes through material structures (fountains, cells, inside-outside and upper-lower distinctions) and embodied techniques of the voice, the audible, and the invisible as manifesting the soul.

"A Portuguese Home": Listening to Lisbon's Transformations

"A Portuguese Home" (Uma Casa Portuguesa), a mid-twentieth century song written in Mozambique and popularized by some of the Lusophone world's greatest stars, invokes values associated with regime-era (1926-1974) propaganda for some Portuguese. Others might invoke this

song ironically to refer to the disappearance of the possibilities of home for longstanding residents who wish to remain living in Lisbon, in a city which has become, over the past decade, a European ground zero for tourism-gentrification. Through ethnographic attention and fine-tuned readings of recent forms of cultural production I examine intersecting, and sometimes dissenting, concepts and experiences of home, dwelling, ruins, and salvage in contemporary Lisbon, as it undergoes seismic changes to the physical and economic infrastructures that enable possibilities for being at home. I listen to everyday and aesthetic forms of sense-making for what they might reveal about making "home" amidst transformation, displacement and mobility--from the incessant roar of flights overhead at dawn, the din of cruise-ships in the new port, the buzz and excitement in the flourishing private archive in a warehouse outside of Lisbon where many bring salvaged detritus documenting Lisbon's former everyday—to a play (Penim, 2022) where the protagonist of the story is a decaying "Portuguese home," a site of colonial amnesia and oppressive subterranean infrastructures, revealed and commented upon in sound and song.

Presenter(s): Lila Ellen Gray

Identification as Sound: Ethnic Signifiers in Central Angola (1846-1890)

This paper explores the sonic infrastructures of identification in 19th-century Central Angola through a close reading of writings by travelers and traders Magyar and Silva Porto. Focusing on the sounds of signifiers used to name others, the paper argues that the ethnonym Ovimbundu, now associated with Central Angola and the Umbundu language, was not used as ethnic identification before colonial rule. Instead, other forms of identification circulated within precolonial infrastructures marked by mobility, trade, and language contact. Rather than treating current ethnonyms as stable categories, the paper follows the iteration of terms designating alterity and considers them as historically shifting and sonically resonant signifiers whose audible and material presence—through speech, writing, and translation—helped constitute ethnic and linguistic boundaries. The accounts of Magyar and Silva Porto reveal blurred linguistic borders, with Umbundu operating as a lingua franca beyond the region to which it was later assigned in vernacular and ethnographic discourses. In this context, the sound of language—its phonetic texture, cadence, and recognizability—functioned as a kind of auditory infrastructure mediating distinctions of belonging, status, and alterity. By foregrounding the materiality of language and the auditory dimension of naming, the paper contends that ethnicity in Central Angola was not simply represented through language but acoustically constituted through it.

Presenter(s): Iracema Dulley

Disquiet: The Aesthetics of Cattle Slaughter in Msinga, KwaZulu-Natal

Disquiet is inherent to the idea of sacrificial slaughter. At a Zulu wedding in Msinga, KwaZulu-Natal, sacrificial slaughter facilitates ancestral presence while materializing new social relations. Ancestors who are tended in turn guide and protect families in uncertain times. Through its collaborative skilled process and in its provision of food, slaughter also creates the party, a sonic liveliness animated by the feeling of the cow. My goal in focusing on the aesthetics of slaughter is to

build on the heretofore transactional and masculinist emphasis on cattle exchange (essential to weddings) as local infrastructure. By cultivating the feeling of the cow through aesthetic engagement surrounding its killing – and that supports its killing – men and women keep cattle close, even as livestock accumulation and herding become unsustainable in a degraded ecology and economy. With herds relocated to formerly white-owned pastures away from home, by those who can afford to do so, and cattle theft an enduring dynamic, I argue that slaughter is disquieted also by legacies of colonial and apartheid violence. I treat sacrificial slaughter ethnographically as a partially recuperative infrastructure from these tough histories, which nevertheless have sustained the "cattle complex" (Herskovits 1926) and cattle as "a special kind of property" (Ferguson 1981). The disquiet of sacrificial slaughter is at once a disquiet of absented relations.

Presenter(s): Louise Meintjes

Oceanic Entanglements: Infrastructures of the Inaudible and the Audible in the Caribbean

Between the 1930s and 1991, the US operated a classified underwater auditory surveillance system called SOSUS, Sound Surveillance System. It consisted of a series of hydrophone arrays that were installed in the ocean floor throughout the Caribbean Sea, the Atlantic and Eastern North America and eventually in the Pacific. While meant to track enemy submarines, these hydrophones were also the first to capture the sounds of whales and other submarine life. By the 1920s the United Fruit Company had created a major cruise system – while banana ships moved cargo to New Orleans and other ports, when returning to the Caribbean, they moved tourists and musicians. Cruise ships depended on a radio network not only for maritime transportation but for circulating Caribbean music. This paper challenges the notion of an aural phonocentric Caribbean by contrasting the infrastructures of inaudibility of classified hydrophones with the audible ones of cruise ships and radio. It explores how aesthetics of the inaudible are entangled with those purported to deploy the audible, in a zone that was deemed one of the crucial extractive zones of the planet. It also questions the idea that a submarine oceanic Caribbean began in the 1990s and rethinks the relationship between submarine and superficial oceanic endeavors as mutually constituted, thus making us rethink sound's very description and materiality as waves and vibrations.

5143 Imaginations and Temporalities of Belonging and Enclosures

Start Date: 11/21/2025 8:30 AM **through** 11/21/2025 10:00 AM

Venue: Sheraton **Room:** Napoleon BR D3 (3rd fl)

Type: Roundtable/Town Hall

This roundtable raises new methodological and epistemological questions around how quotidian ideas of belonging and enclosures are imagined across space and time. Vivian Y. Choi, Nidhi Mahajan, Bettina Ng'weno, and Arjun Shankar will discuss their recently published monographs, in conversation with Sharika Thiranagama. Each author will highlight key concepts that animate their work. Nidhi Mahajan asks how marginalized Muslim dhow sailors from India navigate the perils and

possibilities of voyaging across the Indian Ocean as they maneuver multiple regulatory regimes wrought through colonialism, neoliberalism, the rise of Hindutva, insurgency, climate change, and border regimes across the ocean. Through a transregional ethnography of the interplay of moorings and voyages, she highlights how sailors produce capital in the interstices of the global economy. Arjun Shankar asks us to think with the dilemmas that emerge when the savior slot is no longer filled by those who are "white" and therefore cannot be as easily critiqued for being on the wrong side of the "global color line". He produces a unique conceptual framework linking global migration, racialization, and caste capital in order to capture this phenomenon in the case of India and its diaspora. Bettina Ng'weno asks how we make cities home that refuse that premise and are built to exclude us through anti-urban policy, law and practice. She highlights how people contest anti-urbanism through their insistence on building life in the city despite it, even in the current dynamic of ubiquitous demolition and reconstruction. Indeed, through quotidian practices and creative resistance, long-term residents imagine alternatives to displacement, create belonging, and build new urban futures. Vivian Choi asks how new forms of governance and disaster management led to enduring forms of precarity and insecurity in Sri Lanka after the 2004 Indian Ocean Tsunami. In particular she shows how the logic of governing both natural disasters and terrorism as threats to national security justified the state's militarized aggression in the war against the Tamil Tigers, while also perpetuating hegemonic Sinhala Buddhist nationalism. Choi ask how life perseveres against perpetual uncertainty and danger-caused by natural disasters and state-sanctioned violence alike. The discussion will thus highlight racial and caste capitalism, disaster nationalism, anti-urbanism, moorings and voyages offer epistemological and methodological approaches to thinking about different forms of belonging and enclosures.

4914 Spectral Fluviations: Emergence and Submergence in Damp Terrain

Start Date: 11/21/2025 8:30 AM **through** 11/21/2025 10:00 AM

Venue: Sheraton **Room:** Nottoway (4th fl)

Type: Oral Presentation Session

If all land is sedimented with pasts, this might be doubly true in the damp and watery environs that make up coastal and riparian space. Here, histories of racialized expropriation and violence haunt the present; old projects of managing terrain necessitate new interventions to mitigate harm; things that circulate through these zones-ships, capital, bodies-run afoul of things that have settled in shallow stream beds; fixed ground dissolves into watery depths, occasionally to re-emerge once again. In these spaces, sedimentation is not just a metaphor, but it constitutes the unstable

material on which pasts and futures contend to reshape the fragile present. Yet, traces and sediments are hardly stable or reliable in damp terrain: while some endure, often at great effort, many emerge and submerge in relation to volatile material and semiotic dynamics. Taking such sedimentation seriously, this panel explores the ghostly natures of deltas, estuaries, wetlands, and river basins. It takes damp zones at the interface of land and water as uneasy palimpsests of expropriation, grand plans and humble hopes, violence, extractions, and management. It sees fluvial terrain as a place where these histories-material, social, supernatural—are constantly in the process of both occlusion and resurfacing. We will discuss fluviations – by which geologists understand a river's deposition of sediments – as spectral processes, where undead pasts produce uncertain presents.

Presentation(s): Terrestrial techniques, hydrological denial, and drinking water consumption in New York City

This presentation explores the concept of hydrological denial in New York City, where urban development has long sought to erase the presence of pre-urbanization water systems. Using a provisional framework of first, second, and third waterscapes—respectively, pre-urban surface and groundwater, piped municipal water, and commodified forms such as bottled and filtered water—I examine how these shifting modes of water provisioning shape perception and consumption. I focus on how buried hydrological pasts resurface in material and imaginative forms, influencing contemporary beliefs about the purity of tap water. Despite centuries of transformation—marshes filled, creeks culverted, ponds drained, and inland waterways turned into sewers—New York's pre-urban hydrology has not vanished. It returns as spectral fluviations: ghostly flows made visible through flash floods, the daylighting of long-buried creeks, rusted infrastructure exposed by construction, and subterranean seepages along subway lines. These reemergences disrupt the modernist fantasy of a sanitized and controlled water system. Residents often interpret these watery apparitions through anxieties about infrastructure failure and contamination, merging visions of buried nature with fears of piped pollution. By tracing how ecological memory and infrastructural distrust converge in these spectral encounters, I argue that hydrological denial is not merely historical but actively shaping the urban present.

Royal Sediments, Slave-built Channels and Mobile Commoner Land Use: The Intricacies of Turning a Zambian Floodplain into a World Heritage Site

This paper explores the intricate contestations surrounding the proposed designation of Zambia's Barotse (Zambezi) Floodplains as a UNESCO World Heritage Site in the late 2010s. Originally advanced by Zambia's WWF, the National Heritage Council, and the Barotse Royal Establishment, the application sparked intense debate among royal authorities, dissident chiefs, independence movements, and the state. The floodplains became a battleground of competing visions: a global natural heritage site, the heartland of an autonomous Barotse identity, or a national breadbasket optimized for intensive agriculture. As tensions escalated, the Zambian president suspended the process, calling for consensus.

The paper analyzes these conflicts through the layered histories inscribed in the wetlands—royal burials on sediment-built islands, precolonial slave-dug channels connecting these islands, and the seasonal, mobile land use practices of commoner communities. It attends to more-than-human histories, including the roles of spirits, aquatic wildlife, and the fluvial dynamics that shape cycles of inundation and habitation. Drawing on contemporary accounts and historical anthropology, particularly Max Gluckman's early work in the region, the paper examines how sedimented pasts, spiritual geographies, and adaptive livelihoods complicate efforts to frame a singular heritage narrative for this volatile and deeply storied landscape.

Presenter(s): Michael Bollig

A Spectral Landscape of Shifting Sediments and Sentiments

At the German North Sea coastline, the Langenwarder Groden serves as a compensation area for the expansion of the adjacent Wilhelmshaven harbor. Rewilding has emerged as a new ecological initiative: a breach in the dike has created an artificial wilderness, now a source of pride for the national park, a UNESCO World Heritage site. However, local residents had to be painstakingly convinced of the ecological value and potential economic benefits this new protected area would bring. This effort succeeded, at least formally. Yet, in the evening, as residents stroll along the dike, they see the lights of the harbor and curse the sight of millions flowing into global business ventures, while they are left with nothing more than a stretch of wilderness.

Between the Langenwarder Groden and the harbor lies a vast mudflat, with constantly shifting sediments, under which entire villages are buried, lost in storm surges of past centuries. Many landmarks serve as reminders of these tragedies, while the lights of the harbor evoke the historical inequality of the region. The compensation area thus bears the ghosts of the past, the terrors of the sea, and the haunting legacy of inequality.

Presenter(s): Werner Krauss

Boom Ghosts and Bust Wrecks: Haunting Past Resource Frontier Futures in the Mackenzie Delta

This presentation examines the spectral afterlives of stalled extractive futures in the Mackenzie Delta, situated within the Inuvialuit and Gwich'in Settlement Regions of Arctic Canada. Once envisioned as a major hydrocarbon frontier, the Delta experienced two brief but intense waves of oil and gas exploration in the 1970s and 2000s. While these booms introduced employment,

infrastructure, and development promises, they also left behind polluted sites, decaying industrial remains, and enduring social disruptions.

Drawing on ethnographic research, I trace how Delta inhabitants contend with the material and affective residues of these cycles—sunk vessels in shallow channels, broken kinship ties from long industry shifts, and ongoing environmental remediation work. These hauntings are not merely remnants of the past, but animate present-day relations to land, labour, and memory.

Further, I consider how memories of the Cold War-era military presence—another dormant frontier—are being reactivated in the context of shifting geopolitical imaginaries. I argue that Inuvialuit and Gwich'in responses to these layered temporalities reflect long-standing practices of navigating uncertainty, wherein tactical engagement and strategic avoidance have been central to life in a volatile social and ecological landscape.

Presenter(s): Franz Krause

Resurfacings: Spectral Returns in Bengal's Delta Siltscape

Specters are haunting Bangladesh's delta zone. Some are the ghosts of climate's futures—looming prospects of catastrophic inundation and loss. These ghosts of the future intrude on the present, both in the form of lived environmental change and a cascade of initiatives seeking to remake the delta in anticipation of loss and decay. Yet these projects are themselves haunted by projects past—older attempts to manage delta space; longstanding political economies territory and rent; other imaginations of security, prosperity, and extraction. This paper explores these ghostly entanglements as resurfacings, moments when past and future collide in the present to troubling effect. Figuring delta terrain as a siltscape where life is lived not just on, but also through its mutable, damp terrain, the paper explores three moments of spectral resurfacing: negotiations for the reconstruction of a government embankment; attempts to keep inland waterways circulating through dredging; and conservation policies that seek to secure the mangroves for the future of humankind. These projects are all freighted with frontier pasts—specters that transform possibilities, foul workings, and create new opportunities for expropriation in the present. In these projects, to borrow Faulkner's felicitous phrase (written of a different delta), the past is not dead, it's not even past. This paper thus takes these spectral resurfacings as moments to untangle and think the delta's hazy present anew.

Presenter(s): Jason Cons

Ghostly Pasts and Deprecate Futures: Sensing Ennore's Industrial Transformations

The fishermen of Ennore—an estuarine suburb in the northern margins of Chennai—often spoke of what their landscape used to look, sound and feel like before it was built over by coal fired thermal power plants and other large industries. In examining fishing in Ennore, I show how fishing was a sensorial practice by which fishermen recorded the industrialization of Ennore—from feeling the growth of industrial debris caking their riverbed, to sensing an increase of "chemicals" in the water as rashes erupted upon their skins. Yet fishing was also a way to keep Ennore's wetland and riparian

past alive. In their accounts of a changing landscape, the smell of fly ash from the power plant was evaluated alongside the smell of casuarina trees and rice plantations lost to industrial expansion; the blare of the coal conveyor belt was juxtaposed against memories of the calls of jackals echoing in mangrove forests and marshes, as the men reminisced fishing in a river that had once flowed freely into the sea. In the entanglement of the labour of fishing with the labour of keeping a past landscape alive, it was the fishermen's own sense of belonging that was at stake. This paper shows that these entwined labours could even, on occasion, become the basis for refusing to cede to the industrial future that was being routed into their landscape, refusing to cease from calling Ennore their home, and crucially, refusing to give up on calling themselves fishermen.

8985 Canceled Vaccine Requirements and the Social Landscape of a 'Healthy Again' America

Start Date: 11/21/2025 8:30 AM **through** 11/21/2025 10:00 AM

Venue: Sheraton **Room:** Oak Alley (4th fl)

Type: Late-Breaking Roundtable/Town Hall

Florida Surgeon General Joseph Ladapo made headlines the first week of September, 2025, when he announced an intention to cancel all vaccine mandates for children. "Who am I to tell you what your child should put in your body?" Ladapo asked at a press conference. The same week, Washington, Oregon, and California (later joined by Hawaii) formed the "West Coast Health Alliance," a coalition that aims to provide recommendations on immunizations to residents, healthcare providers, and public health officials "based on science, not politics," without regard for (or, in defiance of) federal policies. The COVID-19 pandemic brought to the surface a critical intersection in the social landscape of American healthcare: a nation with a robust infrastructure for developing the COVID-19 vaccine is also home to a wellspring of resistance to recognizing COVID-19 as a serious illness and the COVID-19 vaccine as a critical medicine. In what represents a seismic shift away from consideration of the mode of transmission of infectious diseases, the "medical freedom" movement commends citizens for exercising control over their own vaccination decisions. Five years after the start of the COVID-19 pandemic, massive upheavals in healthcare research funding by the second Trump administration and government-led pressure on university structures highlight today's tensions between the biomedical system and the American populace. September 4, 2025 sparked a swell of debate over requirements for childhood immunization and has the potential to dramatically alter the next 20 years of public health, and with differential effects across the varied geographies and contexts in the United States. This roundtable brings together anthropologists from a variety of geographic and institutional positions and with a range of areas of expertise to discuss current developments around vaccine beliefs and policies in the United States and situate these developments within their social, historical, structural, and political context. Anthropologists must speak on these recent developments, and this roundtable takes as its goal the following actionable interventions: disciplinary conversation with AAA

members leading to a society statement and the generation of a structure for collaboration and participation in information sharing and documentation as a form of collective resistance.

5049 The Politics of Lingering Part One: The preservation, adaptation, and application of Indigenous knowledge and ways of knowing

Start Date: 11/21/2025 8:30 AM **through** 11/21/2025 10:00 AM

Venue: Sheraton **Room:** Rhythms I (2nd fl)

Type: Oral Presentation Session

What happens when Indigenous practices, ontologies, and modes of relationality outlast the conditions that are meant to destroy them? This panel explores the politics of lingering-how Indigenous people, traditions, and more-than-human relations persist, adapt, and insist on life in colonial contexts designed to erase or assimilate them. We bring together eight ethnographic engagements that illustrate the nuanced ways Indigenous practices persist in altered forms, often in spaces where they are marginalized, commodified, or actively undermined. In contexts shaped by displacement, diaspora, and settler colonial violence, lingering is not merely a passive survival; it is an active, relational process. The first part of the panel explores how Indigenous ways of knowing and being help to create and manage relationships with human and nonhuman entities, including the environments and landscapes in which they live. Drawing on research from Ecuador, Peru, and the West and Southwest United States, these papers present a case for the importance of Indigenous epistemologies and ontologies that go beyond the scope of what is considered possible by Western settler societies. The second part of the panel focuses on how various Indigenous communities are navigating their relationships with the world and other beings in the face of colonial intervention. This session centers Indigenous perspective in their interactions with colonial states and governments in an attempt to move past narratives that see Indigenous experiences as reactionary. Ethnographic data for these papers come from Ecuador and the Western and Southern United States. Together, these papers ask how Indigenous worlds linger-sometimes quietly, sometimes defiantly-in spaces that are often apathetic or even hostile to them. We take seriously the labors of making and remaking relationships and of navigating institutions that often refuse to see Indigenous life on its own terms. Lingering, in these contexts, is not a failure to disappear; it is a politics of endurance, of presence, and of world-making.

Presentation(s): A Window into Sociality and Power: Llakichina Songs among Indigenous Ecuadorian Women

Quechua is an indigenous language that spans much of Andean South America, but Kichwa is the dialect specific to a population who live within the lowlands of Amazonian Ecuador. Kichwa women are known for singing llakichina songs that strengthen or rebuild relationships that are under threat. Much of the existing scholarship has approached the study of these songs through thematic analysis of song lyrics. Recent research on llakichina songs is sparse, and fewer scholars have studied the ritual processes women perform when singing a llakichina song. This paper pulls from ethnographic fieldwork to explore how women's songs give insight into Kichwa women's

understandings of their human and non-human relationships as well as their relationship with energy and power, as well as how these women are shaping the world around them through this continued practice.

Presenter(s): Camille Brown

Fantasmas, Acueductos, and Indigenous Waters in the Puquios of Nasca: 500 CE to Today.

Our research on the subterranean canals of the Nasca region, their archaeological origins, and their contemporary importance in social formations today highlights the importance of memory, indigenous knowledge, and deep historical dynamics in water histories and survival. Initially constructed by the Nasca society 1500 years ago and continued in use today, the puquios tap underground aquifers and bind rural communities together through the generations. The contemporary dynamics of these underground aqueducts of Nasca, a region on the desert south coast of Peru, highlight the challenges facing contemporary society as these millennia aged technologies face modern challenges. We explore the water memory of the puquios and how they connect to the current experiences of community, the hydraulic landscape, and the challenges from contamination, climate change, and social transformation. Rural communities of Nasca grew together with this ingenious infrastructure and continue to be shaped by the ancestral knowledge of water behavior and the social memories of water, antepasados, and activity in the recent and distant past.

Indigenous-led Approaches to Post-wildfire Flash Flood Mitigation in the US Southwest

Drylands of the Southwest United States are highly susceptible to wildfires, which are increasing in frequency and intensity due to changing climate conditions. The sudden loss of vegetation and hydrophobic soils that occur in the aftermath of wildfire leave the land susceptible to flash floods,

creating a cascade of compounding social and ecological effects. In the face of these challenges, Indigenous nations of the region are leading efforts to rehabilitate burned forests, leveraging their deeply embedded knowledge of the landscape and innovative techniques in natural infrastructure design to slow the movement of water along elevation gradients, thereby building resiliency to flooding in post-wildfire contexts. This presentation profiles recent restoration efforts of the Santa Clara Pueblo of New Mexico in the wake of the Las Conchas Fire of 2011, which was the largest wildfire in the state's history at the time. The Pueblo's work also offers lessons on the establishment of multi-agency partnerships for disaster response, as well as the ways that researchers and practitioners can respectfully collaborate with Tribal nations to enhance climate adaption in the region. In contrast to the prevailing model of externally-driven climate mitigation and adaptation programs which can reproduce coloniality in both subtle and overt ways, these Indigenous-led practices offer a path that reinforces Indigenous territorial and intellectual sovereignty.

Presenter(s): Katie Foster

Danced Dialogues: The Choreography of Human-Nonhuman Relationality

Dance is an embodied means of facilitating, renewing, and perpetuating relationships – both with humans and nonhumans – and can also help dancers to disrupt and reimagine those relationships. Indigenous and folk dance styles often include elements of human-nonhuman relationships, be that through mimesis, directional focus, physical touch, symbolic movement, or other meaning-laden patterns which help make the abstract understanding of relationality tangible and physical. In a globalising world and in the face of escalating environmental issues, these dances are changing as the people who dance them migrate, the dances are adopted by new communities, and the nonhuman actors within them become increasingly absent. This paper explores how those changes are impacting the built-in human-nonhuman relationships of dances from a range of regions and cultures. It draws on 18 months of informal observation and six months of formal research in the Brigham Young University Cultural Dance Department and culture-specific dance studios in Utah. Through this analysis, it is shown that both the dancers and the dances receive influence from each other and that – though altered – the human-nonhuman relationships can persist. By dancing traditional styles, dancers – indigenous or not – are able to add these dances into their vocabulary of human-nonhuman relationality, and thereby also accept influence from indigenous and folk worldviews which have been marginalised.

2584 Shifting Childhoods and the Lingering Ghosts of Global Change

Start Date: 11/21/2025 8:30 AM **through** 11/21/2025 10:00 AM

Venue: Sheraton **Room:** Rhythms II (2nd fl)

Type: Oral Presentation Session

This session examines the ongoing challenges faced by children and their families in a context of global change and instability. Drawing on case studies from Peru, Guatemala and Ghana, the papers explore shifting experiences and meanings of childhoods amidst the spread of neoliberal

economies, the ongoing consequences of colonisation, environmental and climate change, the imposition of transnational politics onto local communities, and the influence of globalized media and narratives. We focus primarily on children's lives at the local level and then frame these within a broader analysis of intersected challenges and global shifts, seeking to bridge two main approaches in studies of childhood and youth: (1) an ethnographic, child-centered approach that takes a close look at children's everyday experiences; and (2) the analysis of childhood as a social category that is culturally and historically constructed.

Each paper considers both how local childhoods are impacted by global processes, and how children and families actively address these influences through creative forms of negotiation and reinvention of established social values and practices. Jessica Taft explores how Peruvian working children develop unique environmental imaginaries in a context of child-centered climate politics, navigating tensions between local values and global frameworks of climate activism. Sam Okyere's paper examines the lingering impact of colonialism in Ghana's Lake Volta region, focussing on the value clashes between Western anti-slavery NGOs and local understandings of childhood, and the detrimental consequences these clashes have on local children and families.

Drawing on her longitudinal research with Mayan families in Guatemala, Barbara Rogoff analyses videotaped interactions to examine the persistence of cultural values of collaboration and harmony across generations, highlighting cultural resistance to the pressures of globalization. Lastly, Camilla Morelli's paper explores how Matsigenka children in Amazonia develop new cultural meanings and shared imaginations by blending traditional ecological knowledge with globalized media. Together, these papers provide a comprehensive view of how children's lives are shaped by, and actively shape, the forces of global change in times of instability and uncertainty towards the future.

Presentation(s): The Peruvian Movement of Working Children, Environmental Imaginaries, and the Global Politics of Children's Climate Activism

This paper explores how young activists involved in the Peruvian movement of working children make sense of and resist the impacts of environmental destruction and climate change in their communities. Made up of nearly 10,000 working children from rural and urban communities across Peru, the movement has provided an organizational and pedagogical context that has enabled these young activists to develop a shared environmental imaginary. Drawing on ethnographic research, interviews, and the analysis of public pronouncements and archival documents, I first outline some of the contours of this political-environmental imaginary, foregrounding working children's orientation toward materiality, interdependence, and the interplay between economic

and environmental conditions. Next, I will address how working children's movements have tried to bring their distinctive forms of environmental knowledge to the global institutional landscape of climate policy, illuminating the dynamic tensions between three different strands of child-centered climate politics: a) working children's situated and relational analyses of the nexus between climate change, poverty, and their working conditions; b) the individualizing framework of children's right to a healthy environment being promoted by children's rights institutions; and c) the often universalizing temporal and moral imaginary of Fridays for Future and other "global" child- and youth-led climate groups.

Presenter(s): Jessica Taft

Child protection in the shadows of slavery's undead past

In tune with the year's AAA conference theme, this presentation explores how the undead past of the transatlantic slave trade, colonisation, and imperialism continues to haunt international children's rights and humanitarian practices. It draws on research examining the plural and contested understandings of freedom, sociality, and childhood held by fishing communities on Ghana's Lake Volta, alongside those promoted by US-based antislavery NGOs seeking to 'rescue' children from what they define as slavery. By centring the lived experiences of the study participants, the paper brings into sharp relief the enduring, ethnocentric, and stigmatising logics that underpin the NGOs' anti-slavery interventions and the highly illiberal and harmful interventions this construction has prompted. The discussion charts how NGOs discourse and actions ostensibly aimed at promoting freedom often inflict harm and on the very children and families they aim to protect. In attending to these findings, the presentation draws parallels between the missteps of contemporary anti-slavery organisations and those of the 19th century anti-slavery movement from which the former draws inspiration.

Presenter(s): Sam Okyere

Forest Spirits, Urban Monsters: A Longitudinal Analysis of Childhood and Cultural Change in Amazonia

This paper examines the shifting significance of mayan ("spirits") for Matses people, an Indigenous group in Amazonia who only recently formed stable relationships with the national society. The Matses use the term mayan to describe shapeshifting, malevolent beings that populate their surrounding environments and prey on humans. But while Matses elders refer to mayan as forest inhabitants, who own trees and disguise themselves as animals to lure away lone hunters, Matses children have a different view. They talk about mayan as action movie villains, characters from illustrated books, and urban monsters who drive helicopters and shoot machine guns. Drawing on over 15 years of ethnographic research with the Matses in Peru, I frame these shifting views of spirits within a longitudinal analysis of changing ecological knowledge and environmental relationships in Amazonia. I argue that Matses children are not passively receiving these impacts but actively creating new meanings by mixing the knowledge of their elders with their consumption of urban imageries and globalised media. Following the classic works of Margert Mead and Edith

Cobb, and bringing these together with contemporary works on Amazonian ecologies, I suggest that Matses children are involved in an imaginative act of "world-making", reinventing shared systems of meanings and driving the trajectories of their society towards new and uncharted horizons.

7643 Reconceptualizing Women's Labor: The Intersection of Material, Spiritual, Religious and Cultural Layers of Experiencing and Perceiving in Türkiye

Start Date: 11/21/2025 8:30 AM **through** 11/21/2025 10:00 AM

Venue: Sheraton **Room:** Rhythms III (2nd fl)

Type: Roundtable/Town Hall

Women's labor has been studied across disciplines, focusing on labor force participation and employment with a division of formal and informal labor which are mostly informed by the international and national policy making agendas as the main goal of "empowerment of women." This approach takes patriarchy, capitalism and globalization as macro-level effects in which women are missing and described as taken for granted, homogenous and classless.

This study aims to understand women's labor in a holistic and layered approach by exploring their experiences, meaning, attributions and practices as a socio-spatial, contextual, emotional, ideological, religious, moral and spiritual phenomenon. By examining diverse conceptualizations of labor, we aim to transcend dichotomies such as private-public, formal-informal, paid-unpaid and global-local by an understanding that the experiences of "global" are heterogeneous and depend on textual differences.

In the context of Türkiye, the household mediates capitalist relations for women in both informal and formal labor, functioning as a "domestic" unit shaped by fixed patriarchal norms. Historically, the divide between domestic and public spheres defines "housewife" roles-cleaning, sewing, and caregiving-which are justified as domestic even in public spaces, blurring the public-private boundary. Women often frame their labor through concepts like "family," "solidarity," "morality," "patience," and "struggle," accepting normalized role attributions, even in professional or skilled work.

Preliminary findings showed so far that labor, while being a reality expresses material value in the market, also has different value layers like spiritual, emotional and religious place in the producer's world of meaning which may lead to more sustainable, locally informed, justice based and inclusive policy suggestions. Based on the main research question, how the women experience and perceive their labor in "public" and "private" spheres and give meaning to it, this study is based on an ongoing ethnographic research project conducted in twelve cities of Türkiye through focus groups, in-depth interviews and participant observation.

Early results reflect that although labor is mostly represented as a market element expressing material value, it also has relationally a spiritual value fed by religious, cultural and social values and norms in terms of examining the motivations that create it. Women interpret labor through diverse lenses: culture of struggle, affective embodiment, religious commitment, attributed meanings to womanhood as fitrat, desire to be productive, value based moral duty and economic necessity. In this context, we are planning a roundtable to discuss these nuanced perceptions of women's labor and the factors shaping them, fostering a deeper understanding of its complexity.

8688 Haunted Restitutions: Restless Ancestors and the Ghosts of Colonialism in Repatriation Policy

Start Date: 11/21/2025 8:30 AM **through** 11/21/2025 5:00 PM

Venue: Sheraton

Type: Installations

Located in the Sheraton in the Grand Ballroom Foyer, all day Thursday and Friday.

The Haunted Restitutions portal glows with an eerie light, connecting brittle, yellowed physical documents with the sharp clarity of digital testimony. A cloud of fine dust billows, tickling the nose and obscuring the already dim light, as it reveals secrets long hidden beneath 35 years of neglect. Whispers of Native American Graves Protection and Repatriation Act non-compliance echo in the air, mingling with the unsettling murmur of conflicts of interest. A cold feeling settles in the stomach, a premonition of the chilling implications should current legislation move forward, its weight pressing down like the very earth disturbed.

Fabric banners, yellowed like old paper, reveal QR codes that unlock a sinister vault of evidence of Ancestor mistreatment, and promises broken. The innovative hybrid approach dissolves physical limitations, opening up limitless digital vistas for discovery. It casts a stark light on historical misdeeds, revealing how they morph into the contemporary, chilling silence of systematically suppressed evidence and the stench of lingering conflict of interest, palpable as a cold draft. Each QR code, when scanned, links to whistleblower testimonies and digital vaults of evidence. Whispered testimony from a speaker illuminates abstract policy failure. Interaction with physical documents turns the abstract into visceral evidence.

The audience is now the whistleblower, scanning a QR code on a whistle to send a letter to Congress. A dusty guest book serves as a petition to sign.

The installation guides the audience through why 90,505 ancestors are still separated from their community, serving as a spiritual call to action.

The stark installation, devoid of elaborate infrastructure, commands attention with its undeniable evidence. A hushed reverence falls as the sheer number 90,505 echoes in the mind, stirring a collective yearning. A palpable sense of urgency hangs in the air, a silent call to bring these ancestors home.

Organizer(s): Amanda Sanchez

8534 Material Witness: DunDun, Displacement, and the Anthropology of Everyday Objects

Start Date: 11/21/2025 8:30 AM **through** 11/21/2025 5:00 PM

Venue: Sheraton

Type: Installations

Takes place at the Sheraton, in the Grand Ballroom Foyer on the 5th floor, all day Thursday and Friday.

DunDun is a handmade stool crafted by the displaced villagers of Dameng, Henan Province, China. It is made from abandoned heat insulation foam collected from the construction site that now stands where their villages once were. Due to the government's urban planning reforms, the villagers lost not only their land and homes, but also their way of life. The new architectural space fragmented the close-knit bonds between villagers. In reaction, the villagers made DunDun as a subtle resistance. Carrying DunDun, walking, sitting on it, and chatting with old friends in the new neighborhood, villagers try to maintain their previous life rhymes. DunDun carries the memory of Dameng community, and embodies residents' connection to their homeland. However, In the near future, the traces of their living experiences could be erased as the concrete rises around them.

After conducting fieldwork in the Dameng community last summer, we initiated Rehoming DunDun, an adoption project based in NYC. The project draws attention not only to urbanization and gentrification in China, but also to the broader, often overlooked losses that accompany global modernization. Through adoption, we hope to ensure that the experiences of loss among the people of Dameng are not forgotten, but remembered through embodied engagement. In everyday interactions between adopters and DunDun-such as sitting on it, using it, or simply living alongside it-the objects become storytellers, bridging New York and Dameng, and fostering connection and shared experience.

Rehoming DunDun is an exploration of the intersection between museum anthropology and artistic practice, and how ethnographic materials can cultivate public engagement projects. The theoretical framework for Rehoming DunDun explores materiality through the lens of object agency, new museology, and actor-network theory. The AAA installation will be a milestone for our project and part of our ongoing experiment in reimagining the museum exhibition without glass. At the Annual Meeting, Rehoming DunDun will take the form of a participatory, multimedia installation. Visitors will be invited to sit on or rearrange the DunDuns. The space will also feature DunDun's Pack, a pair of zines we created to tell the story of Dameng and DunDun. The exhibition will also weave together photographs, fieldnotes, and oral histories.

We see this project not only as a way of sharing the histories of Dameng, but also as an invitation to reflect more broadly on the effects of displacement and how people cope with change around the globe. Therefore, as a participatory space, participants will be encouraged to reflect on their own experiences-perhaps through writing, drawing, or conversation-helping to build an evolving archive of shared memories of "loss." It is also an attempt to remember those objects that hold human beings together, which are usually regarded as inert entities.

We will provide DunDun stools and zines for the installation. Each stool measures approximately 16 x 16 x 20 inches. We plan to bring five stools to create a flexible, intimate setting for interaction. Around ten copies of DunDun's Pack will be included-five attached to individual stools to encourage reading while sitting, and the rest available for browsing within the space. Photos of DunDun and zines will be shared during the planning process. We welcome the opportunity to work with AAA to integrate the installation meaningfully into the Annual Meeting.

8644 Nobody Tells the Forest to Do Their Work: Climate Resilience and Scientist-Animal Care in Urban and Amazonian Ecuador

Start Date: 11/21/2025 8:30 AM **through** 11/21/2025 5:00 PM

Venue: Sheraton

Type: Installations

Located in the Sheraton by the Grand Ballroom Escalators, all day Friday.

A multimedia exhibition featuring photographs and segments of a documentary film I created regarding my research in the summer of 2024 on conservation biology work in Ecuador. Combined, the photos, videos, and poster apply multimodal ethnography to explore the immense love and loss of working in conservation on a rapidly extracted planet. The ghosts of these animals -- be they extinct species or specimens sacrificed to taxonomy -- haunt the movement to preserve life on Earth in its richness and vibrance, while biologists balance their own emotional needs and the hope they have for organisms, human and otherwise, to develop more hopeful futures.

Amazonian Ecuador exists in contradiction. Its biodiversity is a powerful cultural monument far beyond the boundaries of the rainforest. However, the national economy relies on its extraction through oil drilling and ecotourism. Conservation biologists bear first-hand witness to this ecological destruction and its complex socioeconomic context but may be expected to remain unfeeling and objective towards it, despite the deep love they develop for their study organisms and the environment through their work. These relationships are intensified for herpetologists, who must contend with a cultural disregard for herpetofauna, particularly in an age of global amphibian population decline. This project contests the harsh (perceived) separation between the natural sciences and emotion, expanding on our understanding of climate action and the unconventional forms of care between conservationists and abjected animals. I conducted participant observation and 20 semi-structured interviews with herpetologists throughout Amazonian Ecuador and Quito over a month. Their relationships with the reptiles and amphibians they study reveal a careful

balancing act between maintaining standards of professionalism and holding a profound, personal love for these organisms; both sides of this quandary inform choices that weigh care for individual organisms against a commitment to broader species conservation. My interlocutors emphasized that the greatest impacts of their work were not felt in "technical" science but in the power of outreach efforts that help their communities develop a love for reptiles and amphibians, despite the stigma. Their labor generates conversations about a biocentric and agentic climate future achieved, step-by-step, in our ecological present.

8697 Thick Description: Toward an Interpretive Poetics of Culture

Start Date: 11/21/2025 8:30 AM **through** 11/21/2025 5:00 PM

Venue: Sheraton

Type: Installations

Takes place at the Sheraton on the 4th floor, all day Friday and Saturday.

Thick Description: Toward an Interpretive Poetics of Culture is an artistic exercise in epistemological review. Despite its brevity, Clifford Geertz' 1973 essay "Thick Description: Toward an Interpretive Theory of Culture" builds on Ryle's terminology to assert that "ethnography is thick description" and remains one of the most influential pieces of literature shaping the field of anthropology. Calling for a broader practice of employing interpretive analytics to foster anthropological understanding via the contextualization of human actors and their environments, Geertz positions the ethnographer as an observer, documentarian, and storyteller upon whom audiences rely for "authentic" account of culture.

By crafting an erasure poem using the text of Geertz' essay, I use artistic expression to consider the mechanics of thick description- the process by which the human is transformed into an object of anthropological observation, and its impacts- the exploitation that many marginalized communities feel as they become objectified by the academy and its social scientists. As an individual who holds several marginalized identities while simultaneously operating daily as a researcher tasked with reducing others to method and outcomes, I am using this piece to negotiate and reconcile my realities.

Organizer(s): Ashley-Devon Williamston

8609 Spirited New Orleans: Making a Way in Congo Square

Start Date: 11/21/2025 9:00 AM **through** 11/21/2025 11:00 AM

Venue: Offsite

Type: Special Event

Meet at the archway at the main entrance to Armstrong Park, 701 N. Rampart St. We will be outdoors, so dress for the weather and wear comfortable shoes. This site visit to the city's historic Congo Square, proposed in association with the executive program roundtable "Spirited New Orleans? On Making a Way in Dispiriting Times," will consider the nurturing of ancestral

Afrodiasporic and Indigenous North American spiritual practices that have long sustained local people and communities. Under French and Spanish colonial rule, Afro-descendant people - both enslaved and free - engaged in syncretic practices of drumming, dancing, vending of wares, and communication across language barriers at Congo Square to connect with self, community, ancestors, and spirit. Communal drumming and dance rituals catalyzed spiritual reclamation and release under oppressive, dehumanizing colonial regimes and their plantation economy. These practices produced embodied, collectively shared knowledge that drummers, dancers, and vendors, particularly those affiliated with the Congo Square Preservation Society, continue to honor. This site visit brings together a few of the people who hold space for community and spirit at Congo Square, including orators, drummers, dancers, and vendors, to connect with conference participants on the roundtable themes of nurturing and mobilizing spirit during dispiriting times. At the site, members of the Congo Square Preservation Society, founded in 1989 to preserve the space's Black and Indigenous traditions, will lead participants in a discussion on the historical and spiritual contextualization of the site's significance, engage the practices of communal Afrodiasporic drumming and dancing that have long sustained oppressed communities, and conduct a ceremony for collective healing.

8648 Section Assembly

Start Date: 11/21/2025 9:00 AM **through** 11/21/2025 12:00 PM

Venue: Sheraton **Room:** Armstrong BR (8th fl) (access via elevator only)

Type: Special Event

Section Assembly discussion with the Section Assembly Executive Committee, current Section Presidents, and incoming Section Presidents with terms starting November 2025. Invite only.

3682 Spectral Orders in China: Affective Legality, Emotion, and Politics

Start Date: 11/21/2025 10:15 AM **through** 11/21/2025 11:45 AM

Venue: Marriott **Room:** Bacchus

Type: Roundtable/Town Hall

How do the spectral structures of law and emotion mediate political legitimacy or discontent in contemporary China (Posner 2000; Liang 2002; Qu 1998)? This roundtable focuses on the affective legal life in China, reflecting on how legality and the rule of law in China are not merely rational bureaucratic domains but also spaces haunted by affect, ethics, and aesthetics from traditionalist values, the socialist revolutionary past, and ceaseless nation-building to "conjure and release emotions" (Osanloo 2020: 9). From codified moral sentiments to theatrical judicial performances, the Party-state actively mobilizes sympathy, identity claims, morality, and historical narratives through legal frameworks (Abrams and Keren, 2010). Recent legal developments- from the legally mandated provision of "emotional care" in elderly support, to the tightening regulation of gender and family transformations, and the integration of technologies such as AI, social governance tools,

and reproductive technologies- reveal the state's concerted efforts to delineate the boundaries of public emotion and ethics.

This roundtable will examine ethnographic cases spanning mediation rituals, emerging practices of kinship and care, professional lives, and legal activism, exploring the emotional and affective dimensions of legal processes in contemporary China. We ask: How does the law act as a medium to govern citizens' emotional orientations? How do ordinary people invoke, internalize, or resist the affective demands of law in daily life? What are the processes that cultivate or suppress of anger, empathy, love, pride, or fear? By convening US-based and China-based scholars who bridge legal experiences and ethnographic insight, this roundtable aims to offer new theoretical lenses for understanding the everyday hauntology of political-legal governance as China arrives at the disjuncture of rising nationalistic sentiments, economic precarity and moral crisis (Lin 2024, Wang 2023, Yan 2021). The roundtable aims to contribute to broader anthropological debates on emotion and jurisprudence by situating China's legal experience in the global context of affective governance (Bens 2018, Clarke 2019, Lawther 2020). As liberal legal frameworks are increasingly exposed as ideological illusions worldwide, China's case exemplifies the legal processes to script emotional dramas, cultivate paranoia, provoke moral panic, and produce affective attachments and exclusions, while themselves being shaped by the emotional and political logics they seek to govern. Extending the studies on the social lives of law in China (Brandtstädter 2011, Pia 2024, Zhou and Donahoe 2023), this roundtable contributes to comparative research on affective legalities at a time when legal orders and public sentiments can both debilitate or perpetuate state power in liberal and authoritarian settings.

Presentation(s): Ghosts of conflict: Invoking resistance with “Not a Blade of Grass”

Dave Martins' seminal 1970s song "Not a Blade of Grass" spoke to a Guyanese nation that was anxious about the future of the Essequibo region. The dispute between Venezuela and Guyana over the Essequibo region began in the 19th century before Guyana's independence from the United Kingdom in 1966 and refers back to even earlier colonial documents in which Spain, the Netherlands, and the UK formed the boundaries of their colonies. The territorial dispute over the Essequibo region, inherited from the colonial era, persisted after Guyana gained independence. Although Venezuela recognized Guyana as an independent state in 1966, it refused to relinquish its claim on the Essequibo region. Relations between the two countries deteriorated in the late 1960s and 1970s, marked by escalating tensions and Venezuela's continued assertion of ownership over Essequibo. In 2015, Venezuela renewed its claim on the region, likely driven by the discovery of substantial offshore oil reserves in Guyana that year, some of which fall within the disputed area. This reignited border dispute has fueled nationalist sentiments, often expressed through the use of Creolese in Guyana. A prominent example is the reference to "not a blade o' grass," a 1970 song by Dave Martins that addressed Guyanese concerns about the Venezuelan border crisis at the time. The song's enduring popularity as a rallying cry is unsurprising. Additionally, the use of phrases like "Essequibo ah we own" to assert Guyanese ownership of the region exemplifies how Creolese is used to communicate national identity. This paper investigates the use of Creolese in media and by citizens to express nationalist ideas and to convey Guyanese identity in the context of the ongoing border dispute with Venezuela. Through qualitative interviews and ethnographic observations, my paper highlights the ways in which language attitudes and nationalism intersect, and how these perspectives reflect broader national debates about immigration, economic challenges, and identity in Guyana.

Presenter(s): Emma Kainz

If The Walls Could Talk: Spaces of Repression as Sites of Defiance in Palestinian Refugee Camps in Lebanon

I was in Lebanon on October 7. Driving through the jagged roads of the Palestinian refugee camps, many of which have been around since the Nakba (1948), I became interested in further understanding symbols of protest and the meaning they generate in context. These camps have become neighborhoods: "concrete shelters have gradually replaced tents, and the buildings have grown vertically over the years" (Feldman, 2017: 42). Under a system of economic instability, and social and political marginalization, Palestinian refugee camps are spaces that reflect the conditions to which Palestinians have been subjected for over seven decades by both the state of Israel and their host country, Lebanon. Between the tangled electricity lines and the narrow passageways are walls of graffiti, murals and political posters. Inspired by the work of Kiersten Scheid who argues that "art is relevant to ongoing life in the Middle East and, consequently, key to studying it." (Scheid, 2020: 432), I ask, what can the artistic landscapes of Palestinian refugee camps teach us about spaces of repression and resistance, and how can art provide a lens through

which ideologies and relations between people, land, and state can be seen, heard, and new worlds imagined? Applying a linguistic anthropological lens, this paper draws inspiration from Keane's work on semiotics and materiality (2003) to examine how meaning is generated through artistic interventions. It investigates themes of language, identity, and perceptions on the 'home' through visual and discursive analyses of street art.

Presenter(s): Marybelle Issa

In Search of Affective Alliances: The Poetics and Pragmatics of Marshallese Advocates' Nuclear Narratives in Diaspora

For many advocates from the Republic of the Marshall Islands (RMI) living in the US, the unresolved impacts of US nuclear weapons testing in their home islands presents a troubling conundrum: How might advocates teach USian community members - potential allies in Marshallese struggles for recognition and resources in diaspora - about the "American History" of nuclear weapons testing without also rehashing colonialist sentiments embedded in the well-worn narratives of hapless indigenous victimhood? In this flash presentation, I focus on selected scenes from one Marshallese advocate's nuclear legacy presentation and highlight a few of the communicative strategies they deploy to navigate this fraught position. I argue that through pragmatic moves like deictic shifts, ironic visual imagery, and shifts in linguistic register, this advocate seeks to interpellate their White audience members into what I term "affective alliances" with Marshallese-led causes. I suggest that narrating the nuclear legacy's impacts on Marshallese communities in these ways presents one attempt to manage non-Marshallese sentiments as a potential resource for advancing local struggles. However, I also situate this one performance within the broader ambivalences shared by other Marshallese advocates toward the mixed impacts of nuclear legacy narratives, an unresolved tension that speaks to the persistent and haunting qualities of colonial structures within US recognition politics today.

Presenter(s): Caleb Klipowicz

Let's play together: a children's book exploring linguistic relations

'Khelu Anande' is a children's book project that tries to tackle the issues of language endangerment and linguistic sovereignty. The story is set in Nashik (Western India) and explores the complex network of historical forces that have led to the current linguistic landscape of the city. It is intended for children acquiring Marathi as their first language to start a conversation around language imposition, diversity, and maintenance.

In a country like India that is linguistically diverse, language becomes an important tool for self-determination but also dominance and suppression. The state borders are linguistically determined, giving rise to state languages that are dominant in one state but minoritized in others. Regional languages like Marathi which enjoy state-sanctioned support, find themselves in a position where they are simultaneously at threat from a more widely spoken language while also being a dominant force that pushes other minoritized languages to dormancy. The ghost of 'language endangerment' becomes a tool which renders the dialects of such languages as invisible

and can in turn be weaponized against languages that are seeing dwindling speaker populations. This rhetoric of a perceived threat to the continuity of Marathi and its pride (əsmiṭṭā) feeds into the growing regionalist sentiment that has taken political ground in the state. In this imagination then, an individual who is perceived as the other (non-Marathi speaker) is pushed away and the linguistic diversity of the region is ignored.

The story follows Marathi (the dominant language in the region) and its interactions with other languages like Bhili & Kokni (indigenous languages spoken in the region), Hindi & English (dominant languages sanctioned by the central government that are considered a threat to Marathi's sovereignty), and Ahirani & Khandeshi (languages spoken in the region that are considered dialects of Marathi). Through their conversations, the linguistic history of the region along with the growing tensions and insecurities in the population are brought to the surface. This children's book is an attempt to address these issues in a nuanced way that can create avenues for discussions about language rights (Roche, 2022) with young children.

Presenter(s): Kanupriya Kale

New Approaches to the Study of Copador Glyph Bands: Developing a Catalog and Corpus for a Quantitative Analysis of Glyph Band Structure

Copador polychrome ware, found at sites across the Southeastern Maya region, is known for its abundant yet unreadable glyphic decorations. These have historically been explained as socially prestigious pseudoglyphs. The extreme standardization of these glyph bands has long been noted (Longyear 1952), but no detailed analysis was conducted until Caballero Díaz (2017). This project aimed to expand upon that work by developing a corpus of Copador-style "texts", beginning with a new catalog that limits overlap between signs. I worked with a sample of images of 139 vessels from sites across Honduras and El Salvador. I observed 251 different signs, which were systematically recorded and assigned catalog numbers. Similar to Thompson (1962), signs were classified based on their shape (main vs elongated), which patterned fairly well with their distribution. A corpus of 225 short texts was created based on these sign codes. This corpus has yielded new quantitative data on distributional constraints of glyphs and glyph bands. Current efforts involve characterizing the internal structure of the most frequent glyph sequences, and using these common sequences to gauge the likelihood of linguistic hypotheses for the glyphs. Ultimately, I hope that a thorough examination of these patterns and associated iconography may hint at the social and semiotic meaning (linguistic or otherwise) of Copador texts.

Presenter(s): Ana Kisley

Vocational courses in offshore citizenship, academic discourse of 'passport apartheid' and the discursive legitimization of citizenship as commodity

'Investment migration' (IM) and citizenship-by-investment (CBI) programmes rose sharply in prominence and profitability over the early 21st century. Regardless of citizenship's arguable standing as a Polanyian 'fictional commodity', contemporaneous processes of neoliberal globalization and the 'commercialisation of sovereignty' (Palan 2006) now lead 10-12 states (mostly

tax havens) to allow high-net-worth individuals (HNWIs) to 'upgrade' their citizenship/residency through direct contributions to state revenue or real estate investment.

Despite small numbers of HNWIs engaging in IM, these practices are highly consequential in material and geopolitical terms. While representing a worrying commodification of sovereignty and statecraft, "passport portfolios" are nevertheless cheerfully marketed to clients as an ultimate "Plan B" for HNWI families.

Undergirded by ethnographic insights from industry events, interviews with key stakeholders, and autoethnographic reflection on participation in industry training, this presentation will offer critical sociocultural linguistic analysis of contemporary CBI discourses: firstly, apprehending how this unique commodity and industry is (re-)imagined and (re-)constituted for prospective clients and other audiences via academic discourses of/about the inequality of contemporary citizenship regimes; and secondly, examining how this niche form of wealth management is presented to those agents who seek to work in the industry. I focus, in turn, on media heralding the 'previously-unimagined' opportunities available to investor-citizens, and heralding CBI as a response to the 'unimaginable' mobility rights afforded to non-Western citizens, and the content of courses explaining how to approach the offshoring of citizenship for elite, secretive clientele in licit and conscientious ways.

CBI firms' metadiscursive 'acts of citizenship' (Isin 2012), problematic claims-making and talismanic display of passports frames them as almost magical, invaluable documents, at the same time as they iteratively refashion passports as a banal and necessarily fungible asset class. As I conclude in arguing, examining CBI metadiscourses gleans valuable insight into not just what elite 'HNWIs' imagine as their ideal (self-sovereign, selectively borderless) future, but how they and intermediary brokers ease this future into being through legitimating, multimodal and sometimes rapturous forms of discursive practice.

Presentation(s): Anti-Carceral Classes in the Age of AI

As higher education increasingly moves online, asynchronous class formats raise new challenges for anthropologists putting into practice anti-carceral pedagogies. Rigid "attendance" tracking and policies around assignment deadlines can recreate carceral logics. This paper examines opportunities to reimagine online classroom norms through an abolitionist lens. It calls for rethinking punitive "absence" and late work penalties that result in harsh administrative withdrawals and grade point deductions. We can also reframe the plagiarism conversation by teaching students how to ethically leverage AI to improve their writing and simulate difficult conversations. Rather than policing student behavior through rigid policies, we can adopt restorative practices that view classroom management through a transformative justice lens. Ultimately, the anti-carceral online classroom becomes a space to model restorative accountability centered on personal growth and learning facilitation.

Presenter(s): Caleb Sabatka

Care to Repair: Materiality, Gender, and Class in Urban Egypt

In low-income neighborhoods in Cairo, objects are cared for by men, women, and children. Things are rarely discarded but they are used, reused, borrowed, and fixed many times before they are sold either to local shops or to venders who tour the city to buy broken TVs, fridges, ovens, and more. Based on long-term ethnographic research in Cairo and drawing on new feminist materialism as well as on the work of Pierre Bourdieu, this paper looks at efforts to repair objects like appliances, which are expensive and difficult to replace. More specifically, the paper traces the gendered and classed dimensions of caring for and repairing objects. While all of those who fix appliances are men, women tend to be in charge of them daily, ensuring their proper daily use and spending lots of time and energy to hire someone to fix them when they break. This may involve asking neighbors for recommendations for competent handymen, coordinating a time for handymen to visit, waiting for them for hours to arrive, serving drinks, establishing rapport with them by chatting and exchanging stories, and often calling them again when the appliance breaks down and needs further repair. Through these actions, women both ensure the continued use of these objects and generate social capital (in Bourdieu's sense), which is a crucial resource for families who struggle to get by. Looking at the case of one fridge and the efforts of its owner to repair it several times before selling it and buying a new one, this paper explores relationalities forged between humans and non-humans, highlighting the significance of the work of women and their care practices to the unfolding of daily life in urban Egypt.

Contested Identity of Salt, Contested Identity of People: Biopolitics in The Livelihood Transformation of A Tibetan Salt-Producing Village

This article examines the biopolitical contestation surrounding indigenous well salt in a salt-producing village in Markham amid the profound socio-economic transformations since the 1990s. Historically, Markham salt supported tens of thousands in the Sino-Tibetan frontier through extensive salt-grain barter networks, but since the 1990s, its market has dwindled due to the

government's mandatory introduction of non-local iodized salt. Regarding salt as an agential actor that simultaneously containing and reflecting local power dynamics, this paper critically analyzes the dual entry of the official discourse framed in political neutral improvement on indigenous well salt, as well as the local salt producers' resistance and compliance based on three months of fieldwork. On the one hand, the villagers were frustrated by the official discourse claiming that local salt was unhealthy. However, their discursive resistance was not directed solely at the government but manifested in much nearer, multiple-layered interpretations – disdain toward neighbors, steadfast adherence to religious beliefs, and opposition to top-down stigmatization. On the other hand, authoritative discourses seek to redefine local salt as a central emblem for promoting tourism and economic development. This has led to plans to subsidize salt miners as "heritage preservers" to return to the saltworks, a policy that, unlike previous interventions, has been welcomed by the villagers. By simultaneously denying Yanjing salt's legitimacy as a consumable good while commodifying it as a symbolic asset for economic growth, top-down discursive power contributes to the dual transformation of both identity of salt and identity of people. This paper further interrogates the interconnectedness between the agency and identity of commodities and those of people, urging a reconsideration of the relational entanglement between materiality and sociality.

Presenter(s): Botao Zhao

Signals and Noise: Palestinian Dissonance to Occupation's Soundscape

Since October 2023, Palestinians in the Gaza Strip have taken to social media to share their experiences of life under bombardment and displacement. These civilian documentarians share with global audiences the atrocities of entire city blocks leveled by tons of ordnance. However, they also share reels of children playing soccer amongst rubble, families sharing scant resources in encampments, and men feeding a portion of their rations to cats; it is precisely this footage of mundanity, this continuation of embodied everyday living under constant threat of death that is dissonant to the noise of war imposed upon them by the state of Israel. Utilizing social media footage posted by Palestinians under siege, this article explores how these competing cacophonies, these dual soundscapes of oppression and resistance to annihilation, inform us-marked as witnesses via our screens-of what survivance sounds like. Grounded in Feld's theorizing on acoustemology, this article deconstructs the social and material sonic sensations of war toward the sounds of Palestinian relationality and knowledge production. It situates the technological production of footage with an audible accompaniment, divorced from its spatio-temporality through dissemination on social media, within the Palestinian ethic of sumud (steadfastness) that informs a genealogy of sounding which is resistant to erasure, contending with the sounds of Palestinian relational care as an indigenous knowledge system. Despite the noise of bombardment, Palestinians continue to signal a soundedness of care.

Suicide of Talisman: The Marketization of Tibetan Incense and Its Influence on the Changing Nature-Cultural Complex in Modern Tibet

Tibetan incense has been holding a significant place in the social life of Tibetans, from traditional to modern times, ranging from daily life to religious rituals of Tibetan Buddhism, followed by complete chains of its production and commodification. My research first delves into the long history of local understanding of Tibetan incense, drawing traditional knowledge widely in Buddhist religion(s), local cosmology including the perception of human-nature nexuses, and traditional medicinal practices. The chains of production and inter-regional transactions varied with places, so historical records and archives from local center like Lhasa and local frontiers like towns in Sino-Tibetan border are juxtaposed to form a panoramic collage of this chain. Such complex has been recently shaped by China's market reform which strives to enforce Tibetan incense into a state-wide market. Here underlies a dual crisis within the local nature-cultural complex: the whole constellation of cultural significance surrounding the incense is marginalized and exoticized, hence the divergence of collectible incense in museums as luxuries and mundane incense as daily goods; the ecological value of the incense is over-exaggerated so its production is crystalized as a symbol of sustainability, which legitimizes the nation-state's exploitation of nature in Tibet. In this second part a preliminary analysis is performed based on my filed research conducted in Lu-ho, Garzê, a Tibetan county at Sino-Tibetan border. Cultural and environmental understandings of the incense from both local people and outsiders such as tourists from Han-Chinese regions is mainly examined through interview transcripts and observations, also accompanied by analysis of market data and textual landscape. Last, I make a brief comparison between the marketization of Tibetan incense with other salient market compulsions in modern Tibet such as the "Cordyceps fever" in Nagqu, so as to foreground that this specific transformation is more a (symbolic) suicide in that local people proactively internalize the rationality of "market" and "progress" channeled by acculturation and de-naturalization, than a (symbolic) murder – the direct violence that renders suffering in the dependence of cash and soil nutritiousness, which underlies the latter examples.

The Ghost of Caste: Anthropological Reflections on Diasporic Persistence

This paper investigates the spectral persistence of caste within Indian diasporic communities, employing the metaphor of the "ghost" to elucidate the paradoxical invisibility and enduring influence of caste hierarchies across transnational contexts. Through the lens of detailed ethnographic research conducted in the United States, United Kingdom, and East Africa, I argue that caste is not a static relic of the Indian subcontinent but a dynamic, adaptive force that migrates and transforms, embedding itself within the social, cultural, and institutional fabric of migrant life. The ghostly nature of caste is manifest in the reproduction of endogamous marriage networks, the subtle yet pervasive mechanisms of social exclusion, and the maintenance of occupational and residential boundaries-practices that persist even within societies that profess commitments to egalitarianism and multicultural inclusion.

The metaphor of the ghost foregrounds the affective and embodied dimensions of caste: its capacity to haunt subjectivities, shape kinship imaginaries, and animate collective memory, even as it evades formal recognition or legal intervention. Dominant-caste narratives frequently render

caste invisible, masking its presence under the rhetoric of meritocracy or cultural cohesion. Yet, testimonies from Dalit and other marginalized voices reveal a "hidden apartheid" that continues to structure opportunity, mobility, and belonging in the diaspora. Digital matrimonial platforms, religious congregations, and professional environments become contemporary sites where the caste's spectral force is both reproduced and contested. These spaces not only facilitate the maintenance of caste boundaries, but also serve as arenas for resistance, where marginalized groups challenge the legitimacy and persistence of caste-based exclusions.

This paper also interrogates the ways in which caste's spectrality complicates efforts at legal and institutional redress. While anti-discrimination laws and diversity initiatives in host countries often address race, ethnicity, and religion, they rarely recognize the unique contours of caste-based exclusion. Consequently, caste operates in the shadows, shaping life chances and social relations through informal networks and unspoken codes. The transmission of caste consciousness across generations, often through family narratives, community associations, and ritual practices ensures its continued relevance, even among those raised in ostensibly secular and egalitarian environments.

By conceptualizing caste as a ghostly presence, this paper contributes to broader debates on the afterlives of social hierarchies, the politics of recognition, and the global circulation of exclusion and privilege.

Presentation(s): "Who You Gonna Call?": Popular Ghost Hunting and the Pursuit of Paranormal Experience

Paranormal investigation, or more popularly 'ghost hunting,' has emerged as a significant subculture in which thousands worldwide devote their leisure time to seeking paranormal experiences. Rooted in nineteenth-century Spiritualism and psychical research, ghost hunting evolved into a literary genre in the early twentieth century and has since flourished into today's expansive media franchise. Once a niche interest, it has penetrated mainstream culture through the popularity of television series in the UK and USA (e.g., *Most Haunted*, *Ghost Hunters*) and films such as *Ghostbusters* and *The Conjuring*. Yet critical questions remain: Who are today's ghost

hunters? What practices inform their activities, what motivates these pursuits, what effect has ghost hunting had on them, and how should we interpret this phenomenon?

The conviction among practitioners that they have encountered ghosts suggests that the subculture will be self-perpetuating, even as its broader appeal remains intricately linked to media representations. This nexus of lived experience, reality television, and film production has engendered a complex dynamic comparable to Japanese cosplay, where fictional roles are enacted in everyday life—including through social media personae. In contrast to the relatively benign nature of cosplay, the role-playing inherent in ghost hunting may expose participants to psychological and even spiritual risks. Conceptually, ghost hunting can be reframed as a form of contemporary religious experience in an era characterized by atheistic materialism—a modern cult of the dead with its own psychogeography of sacred sites.

As Avery Gordon observed in *Ghostly Matters* (University of Minnesota Press, 2008), "to study social life one must confront the ghostly aspects of it;" with the phenomenon of ghost hunting we are doing that quite literally. Building on earlier work published by the presenter in *The Paranormal and Popular Culture* (Routledge, 2019) and informed by ongoing ethnographic research using interviews and participant observation, this presentation offers an overview of ghost hunting practices. It examines the behaviors, beliefs, and social dynamics of practitioners while situating ghost hunting within the broader context of popular culture and the evolving landscape of spiritual experience.

Presenter(s): Leo Ruickbie

Dreaming Mirrors: The Nightmares of Anne Rice and Stephen King

Some writers have a way of transforming their dreams into art. Anne Rice and Stephen King have transformed pieces of their dreams/nightmares into novels (Epel, 1993). For Rice there was a woman who seemed to be made of marble, and for King there was the sensation of being bitten. Rice said that she dreamed of a woman walking down the street, and the appearance filled her with fear at a young age. She said that she didn't write *The Queen of the Damned* because of that dream, but that the dream somehow fed her subconsciously. King has said that dreams can be like mirrors to see things from different angles. When he was looking for an ending to *It*, he dreamed of a junk yard with flying leeches that began to suck the blood out of his hand. He said it was a message from his subconscious. Rice and King captured intense dream experiences in their books, which are widely available. The question that will be explored in this presentation is: how can the intense atmosphere from nightmares be meaningful? The value of both authors' literary discourse has been explored (Gelder, 1994). As well as a variety of psychological implications in Rice's work (Davidel, 2020). What remains to be researched is the power of nightmares in writing. It can be considered a heritage that goes beyond waking thought. Jeannette Mageo's (2022) mimetic structure of nightmares will be briefly considered in conclusion. If nightmares act as reflections, then hearing them can be meaningful as well as questioning them. According to Mageo, the purpose of dreaming is to figure out cultural issues that influence personal meaning. Nightmares in writing are meaning-filled records, which can give readers greater reflection on consciousness. However, given the horror genre, it is suitable to explore with caution.

Presenter(s): Rebecca Damien

Healing with Horsetail: Exploring Plant Kinship through Ethnographic Art Practices

This slide show "flash" presentation will be based on a doctoral dissertation (2025) investigating the concept of plants as teachers as a way to decenter a human-centric perspective and worldview. By acknowledging plants as sentient and intelligent beings, this work aimed to facilitate pathways for others to engage in restorative and reciprocal relationships with the vegetal world. More specifically, it explored the relationship between the human animal (*Homo sapiens*) and horsetail plant (*Equisetum* spp.) by employing multispecies ethnography and arts-based research for a decolonizing journey of Indigenization, incorporating a Druidic lens to develop an ecocentric and kincentric worldview.

Horsetail is the focus of this investigation because while working with plants as herbal remedies, an encounter with horsetail opened up sensory perceptions that deepened the researcher's awareness of plants as actively engaging with humans on a transpersonal level. This multispecies ethnography took place over three seasonal cycles between Spring 2022 and Summer 2023, documenting researcher encounters with horsetail plants in the boreal forests of the Canadian Pacific Northwest and the traditional lands of the Coast Salish Peoples. Situated at the methodological and theoretical crossroads of ethnography and decolonization, the data analysis focused on plant and human relations.

This presentation will focus on ethnographic arts-based practices that provided a catalyst and structure for learning with plants from an animist and Druidic perspective. Art practices included a range of media, such as sound, video, photography, botanical drawings, and imaginal artwork. Based on data gathered from three cycles of field research, five themes emerged, inspired by cultural concepts from Druidry: seasons, deep time, Calas (land), Gwyar (sea), and Nwyfre (sky). The researcher's encounters and dialogue with horsetail plants revealed a playful and creative way to restore a healthy relationship with the land. When considering how to respond to the negative impact of climate change and environmental degradation resulting from an anthropocentric worldview, this research illustrates how a kincentric perspective allows for a transformative shift of the collective focus-moving from urgency to agency.

Presenter(s): Sandra Christensen

Sensing the Imperceptible: Miraculous Visions and the Politics of Perception in Bangladesh

Drawing on ethnographic accounts of a widely witnessed miraculous event-the reported appearance of Allama Sayeedi's face on the moon-in Bangladesh in March 2013, this presentation explores how miracle sensing unsettles moral and political landscapes. This visual event, which triggered mass mobilizations and deadly violence, exposed deep fractures within the nation's sensory order, highlighting the existence of two distinct aesthetic regimes-each with its own epistemological assumptions, embodied dispositions, and moral frameworks that dictated what could be seen, believed, and discussed.

The secular-modernist regime, emphasizing objective vision and empirical validation, immediately dismissed the miracle as a crude visual deception or mass delusion, interpreting belief in it as evidence of irrationality. Within this framework, the vision was met predominantly with satire, parody, and moral condemnation, disseminated through memes and satirical imagery aimed at reasserting rationalist authority. Vision, here, was understood as detached and reflective, strictly bound to empirical verification, rendering anything transcendent or miraculous as inherently suspect and irrational.

Conversely, the second regime was anchored in embodied aisthesis—a sensory disposition shaped by theological belief and habituated faith. Here, perception was inseparable from moral purity and religious orientation, and the eye functioned not as a neutral observer but as part of a larger embodied sensory ecology. In this perspective, the miracle's truth was thus not empirical but affective, embodied, and morally resonant, capable of mobilizing bodies, emotions, and political action.

Drawing upon Wittgenstein's notion of gestures, Merleau-Ponty's phenomenology of perception, and Rancière's distribution of the sensible, the presentation argues that miracles are not irrational anomalies but sensory ruptures that disrupt dominant symbolic and moral orders. They gain significance through intercorporeal, habituated practices shaped by theological, historical, and metaphysical discourses, thereby constituting distinct worlds of experience where miracles affirm rather than defy cosmic order. Ultimately, this analysis reveals the political potency of sensory disruptions in redefining what is perceptible and articulable, challenging both secular and religious orthodoxies through deeply embodied modes of perception.

Presenter(s): Muhammad Nabil Zuberi

Spectral Hauntings in *Beasts of the Southern Wild*

Thirteen years after the film *Beasts of the Southern Wild* opened theatrically to critical acclaim in the summer of 2012, it continues to exemplify what various reviews have termed a monomythic coming-of-age story, "a wondrous, visually resplendent fairy tale," "a post-Katrina folk creation myth," "a full-blown magical realist movement," and an ethnographic study of a tightly knit community known in the film as "The Bathtub." Set in the bayous of southern Louisiana (Terrebonne Parish, south of New Orleans), the film follows Hushpuppy, a six-year-old girl who searches for her identity amid an impending apocalypse of floods, prehistoric creatures, and more. It may come as no surprise therefore that the film's 29-year-old director, Benh Zeitlin, is the son of two prominent folklorists based in New York City, Steve Zeitlin and Amanda Dargan.

Curiously, *Beasts of the Southern Wild* does not appear in most discussions of ghost films even though the film's magical realism creates liminal spaces where spirits and ghosts could haunt and even though the film's nonlinear story blurs the line between what's real and what's imagined. Accordingly, this flash presentation will explore how the film employs multisensory strategies—visual, aural, real, and unreal—to enrich our understanding of how individuals and communities may

deal with adversity and disaster in their ongoing search for dignity and identity, and also how memory and imagination may serve as spectral hauntings.

Like many spiritual heroes, Hushpuppy possesses magical powers, perhaps the result of a mysterious birth and a mother who appears ghost-like in the film. "She was so pretty," Hushpuppy explains, that "she never had to turn on the stove. She walked into a room and all the water starts to boil." Like the heroes of Joseph Campbell's monomyth, Hushpuppy encounters a world both of wonder and potential threats, but always stands resolute in order to realize her spiritual destiny. By the end of the film, Hushpuppy realizes that she is "a little piece of a big, big universe, and that makes things right. The scientists of the future, they're gonna find it all. In a million years, when kids go to school, they're gonna know: once there was a Hushpuppy and she lived with her daddy in the Bathtub."

Presenter(s): James Deutsch

The Spirit Behind The Specter: Confronting Historical Trauma in Drill Music

This presentation explores how Drill music serves as a medium for encountering historical trauma and affirming solidarity among marginalized communities. Drawing on Jacques Derrida's hauntology and its philosophical antecedents, as well as René Girard's mimetic theory, this research examines how artists like Chief Keef and Baby Kia confront the specters of historical violence, "bringing the hood together" with the cathartic intensity of their music. This analysis reveals how Drill music articulates the pain of historical traumas such as mob violence, war, and educational discrimination. While not necessarily reflective of the majority of Drill music, the songs of Chief Keef and Baby Kia (including their sonic qualities, lyrics, videography and album cover art) often feature themes of both spectrality and spirituality. The juxtaposition of undead imagery (zombies, demons, and ghosts) with Christian settings and symbolism suggests death and rebirth, reflecting Derrida's assertion that "to live" can only be learned "from the other and by death." Furthermore, by centering themselves within a phantasmagoria of aggression, Drill rappers are positioned as Girardian scapegoats, often receiving the blame for societal issues, while in actuality disrupting cycles of violence and redirecting mimetic rivalries toward themselves. This research challenges simplistic narratives that blame Drill artists for promoting violence, instead suggesting their work represents a complex engagement with historical trauma, a challenging of ontological limits, and a search for belonging. The multi-modal complexity of Drill challenges listeners and scholars to acknowledge the spirit of healing behind the specter of violence.

Spirits of the Ancestors in the U.S.

Despite beliefs that spirits of the deceased ancestors persist in numerous cultures, contemporary anthropology has largely neglected such beliefs and their study in the U.S. People's accounts of experiences with recently deceased family members are often discounted or dismissed in contemporary America. In this paper, I argue that such possible encounters nor the people who have them should be trivialized. Their experiences resonate with those of nonwestern peoples.

Although they are believed to have happened in the present U.S., considering such beliefs as part of the human condition will broaden our understanding of it, and add to our understanding of how some in the West continue to emphasize the importance of spirits in the face of a scientific and political economic discourse which celebrates the material and posits a spiritless universe. I describe the supposed experiences of members of working-class families in the U.S. with a spirit of a recently deceased family member. Those experiences challenge dominant psychological conceptions of perceived experiences with recently deceased family members because sometimes they were functional, at other times disturbing and frightening, and ultimately predictive and heartrending. They contradict a psychological perspective which would dismiss them as simply being either wish fulfillment or the result of guilt emanating from the minds of those who had them. I suggest that such experiences might be seen as indicative of a level of spiritual reality long suppressed by mainstream scientific and religious paradigms in the West, but which remains found in many societies as manifested by beliefs in the persistence of ancestral spirits and their possible effects on the living. The paper should make a contribution to anthropology's research on and interpretation of individuals' believed experiences with deceased relatives within the U.S. and Western societies generally.

4600 Breaking Bread, Building Bonds: Food, Cultural Belonging, and the Construction of Social Networks

Start Date: 11/21/2025 10:15 AM **through** 11/21/2025 11:45 AM

Venue: Marriott **Room:** Balcony L

Type: Oral Presentation Session

This panel explores the interplay of food, cultural belonging, and social/relational networks. Across cultures, food has served as a way to connect the self to the group, providing deeply felt communities of belonging. These communities produce relational networks that members can call upon to enact reciprocal exchanges to deepen a sense of community or to further perceived social capital. Through the use of ethnographic and autoethnographic methodologies, the presentations examine how everyday acts of food sharing serve as vital mechanisms for expressing self, cultivating social bonds, and negotiating cultural values as understood through reciprocal exchanges. Whether through formalized network systems or casual connections, food functions as both a symbolic and material anchor in the ongoing construction of relational worlds. In addition to food acting as a bridge between the self and the collective, panelists explore how the role of food emerges as both a symbolic and material force within the networks of society. By analyzing the intersections of food, belonging, and networks, we aim to advance insights into how commensality practices sustain social cohesion and cultural continuity. This panel analyzes communities in Taiwan, Puerto Rico, and various diasporas in the United States.

Presentation(s): The Cycle of Giving: Food as a Vehicle of Obligation and Connection in Taiwan

This paper explores the role of food as a medium for constructing and maintaining social relationships within Taiwanese culture through the lens of autoethnography. By analyzing personal experiences of commensality, hospitality, and reciprocity with Taiwanese people, the study demonstrates how food-sharing functions as a key mechanism for establishing *guānxi* (關係), a deeply rooted social network system in Taiwanese and Sino-cultures. Through three case studies, this research highlights the transformation of transactional relationships into fictive kinship, where obligation and reciprocity serve as cultural imperatives rather than burdensome duties. Drawing on theories of Maussian gift exchange, Bourdiean social capital, and social clientelism, this paper argues that *guānxi* is not solely a business practice but a dynamic and personal process that fosters long-term social cohesion. Ultimately, the study underscores the significance of food as a symbolic and practical tool for reinforcing cultural belonging in Taiwan.

Presenter(s): Sarai Brown

Cottey College's Global Potluck: Belonging and self-expression

This paper considers the evolution of a campus event that has moved from a larger-scale celebratory festival to one that primarily focuses on sharing food. We recruit cooks from across campus—faculty, staff, and students—and value the event's process as much as its offerings of culinary diversity to students and the broader campus community. Built into its process are shopping trips within and outside our rural location in Southwest Missouri, these trips allowing students to find "home" through the food purchased that they then share in their food-making as well as at the more public potluck.

Participants and their foods are often difficult to pin down. Many come from the Midwest, and many have multiple homes/homelands through their families' transnational journeys. Indigenous students, Hawaiians (of various ilk) have participated as have first-generation and second-generation students from immigrant families, international faculty, and international students. The potluck brings culturally dispersed foods and folks together, creating shared community through a meal. Nevertheless, this paper allows us to critically reflect on the effectiveness of the event as "a potluck," a space for sharing material provisions alongside (we hope) social networking and cultural exchange. We ultimately probe what belonging means through this campus-sponsored event mimicking a nostalgic North American pastime.

Presenter(s): Sarah Quick

Teff in Motion: Culinary Appropriation, and the Politics of Reworlding in the Transnational Agrifood Network

This study investigates how teff—the world's tiny food-grain central to the Ethiopian culinary and cultural tradition—circulates across the transnational agrifood commodity circuit. Drawing on ethnographic data across five US States, the study examines the shifting meanings and transformation of teff based on three intersecting analytical lenses. First, I investigate how teff becomes a site of epistemic and gustatory appropriation, where racial and cultural difference is enacted and negotiated. Secondly, by following the semiotic and material processes of its consumption, I examined how teff's cultural significance is both reconfigured and mobilized in the appropriated agrifood markets. As teff becomes a fetishized cosmopolitan commodity, circulating in high-end grocery stores and transnational food markets, its significance as a cultural medium of Ethiopian commensality, identity, and memory continuously becomes blurred and contested. This tension reveals the politics of reworlding: the countercurrents of resistance, innovation, and relationality that persist parallel to the extractive commodity logics. Informal food networks and household culinary practices emerge as expressions of resistance, unsettling the extractive value regimes that serve as mechanisms of dispossession. In this context, teff reinvents itself, fostering diasporic space-making, sustaining cultural continuity, and affirming identity through the everyday culinary practices.

Presenter(s): Aklilu Reda

Kitchen Boundaries: Food Labor, Spatial Politics, and Relations of Care within Punjabi Diasporic Life

In many Punjabi immigrant households in California, a spatial division emerges between an pristine indoor kitchen and a secondary "garage kitchen". These spatial arrangements are not merely practical; they structure sensory life, domestic labor, and social configurations, while seeming to reproduce familiar binaries: clean/dirty, feminine/masculine, public/private, and modern/traditional. The indoor kitchen performs American middle-class respectability, shaped by colonial and racialized ideals of cleanliness. In contrast, the garage kitchen becomes a space of sensory abundance, care labor, and cultural reproduction. Drawing on ethnographic fieldwork with Punjabi families immersed in California's food supply chain, this presentation explores how these kitchen logics are embodied, negotiated, and contested. Cooking spaces emerge as sensory and social zones where roles, boundaries, and cultural values are reconfigured. Langar kitchens—where Sikhs cook together through seva (spiritual service)—further complicate domestic dichotomies as they model an alternative site of food labor that resists caste, gender, and class divisions. Rather than reaffirming dualisms, this paper uses a poststructuralist and feminist lens (Ahmed 2004; Ameeriar 2017; Mahmood 2005) to trace how Punjabi diasporic kitchens are structured by cultural norms but also marked by improvisation, friction, and care—remaking the social through space, embodiment, and food.

Presenter(s): Harleen Bal

What Thrives Here: Hmong Gardening, Gathering, and Subsistence Practices in Anchorage, Alaska

What happens when Hmong families, whose histories are grounded in Southeast Asia and shaped by swidden agriculture, collective labor, and forms of subsistence oriented more toward living off the land than market-based exchange resettle in Anchorage, Alaska as part of a broader refugee experience? How do they continue to gardening, using medicinal herbs, foraging, fishing, hunting, and at times, how and why do they choose not to? What values, relationships, and forms of knowledge guide these decisions, and what are their broader implications for understanding belonging and adaptation in diaspora?

In Anchorage, these practices form part of a relational infrastructure through which Hmong residents express and continually negotiate their place in both local and translocal worlds. They are shaped by collective ethics of care and reciprocity, practical considerations oriented toward family well-being, and spiritual practices, traditions, and beliefs. At the same time, these activities draw people into sensorial engagements with place, memory, and health, often evoking nostalgia for ways of living carried forward in new contexts. Drawing on ethnographic research, I explore how food invites forms of engagement in labor, taste, memory, and care that sustain households and foster relationships within diasporic networks. What emerges is a relational process shaped through lived experience, negotiation of cultural values, and the ongoing cultivation of belonging.

Presenter(s): Margaret Brady

From Bloodlines to Breadlines: TRANSgressing the boundaries of family to make kin. Kinship, Queerness and the Sociality of Sustenance

The making of kin in Queer and Transgender communities relies less on bloodlines and more on intimate forms of sociality like commensality and food aggregation (Fitzpatrick, 2018). There is limited research at the intersection of Queer and Transgender communities in Puerto Rico, food, and kin. This research project is an introductory exploration into the role of food in queer and transgender communities in non-sovereign nations. Puerto Rico is an archipelago where 80% of its food is imported, and what arrives is dictated by the United States (Ayala et al., 2021); it is one of the world's continuously colonized territories. Coloniality is thus imported to the islands not just through food, but also through a neoliberal modernity whose conceptualizations of kin, gender and sovereignty become translated through the Puerto Rican experience. Yet, Puerto Rico is home to a growing food sovereignty movement grounded in queer feminist praxis and "embodied decolonial resistance" (Crowe, 2020:1). This study interviews Queer and Transgender Puerto Ricans to explore how commensality, kin-making through shared meals, and food adequacy which maintain "intimate forms of sociality" (Garth, 2020:5). This study documents decolonial interventions by Queer and Trans farmers and community organizers responding to colonial disruptions in the archipelago's food supply.

Discussion

2393 The Legacy of Ernesto de Martino (Part I): Being with Others - Other Humans and the More-than-Human

Start Date: 11/21/2025 10:15 AM **through** 11/21/2025 11:45 AM

Venue: Marriott **Room:** Balcony M

Type: Oral Presentation Session

This year marks the 60th anniversary of the death of Ernesto de Martino (1908-1965), a founding figure in Italian anthropology whose ghost still looms large in the Italian tradition, continuing to inspire countless works today. De Martino's thinking is incredibly timely for the current state of world crisis, as demonstrated by his masterwork on apocalypse (*The End of the World*, published in English in 2023). Bringing together established as well as junior scholars, this double session interrogates the legacy of de Martino's eclectic thought from various angles, providing the opportunity to think with him and acquaint a broader audience with his work. In line with critical "world anthropologies" perspectives, the sessions counter anthropology's anglophone hegemony by focusing on a brilliant anthropologist who is not widely known outside of Italy.

Part I is fundamentally inspired by the political de Martino, who was a highly engaged and public anthropologist. The first two papers take a fresh look at de Martino's work from a historical-biographical perspective. Early ideas of "being with Others" emerge in de Martino's Gramscian-influenced analyses of subaltern culture and in his engagement with politics and literature (Ciavolella). The "others" in many of de Martino's empirical studies were gendered as female: the women who participated in phenomena of magic, funeral lament and tarantism. De Martino's key female collaborators Clara Gallini and Amalia Signorelli subsequently thematized gender as part of the demartinian legacy that they carried on until their deaths (Franceschi). Two further papers apply de Martino's thinking about being with Others to a topic that he did not really address directly but is of great relevance and interest today: that of more-than-human Others. De Martino's analysis of tarantism's spider poison helps us to rethink current environmental poisoning (La Rock). Furthermore, Southern Italian fig trees exemplify complex anthropogenic environmental interactions that produce negative effects on both the trees and the humans whose world they help comprise (Krause). In his final years, de Martino theorized an original reflection on decoloniality, formulating the notions of "critical ethnocentrism" and "ethnographic humanism". Both of these concepts are productive for helping us to flesh out ethnographers' relationships to the Others they are studying (Shapiro). Despite its limitations, Martino's decoloniality can spur us to rethink epistemologies that grasp the non-human and more-than-human in non-Eurocentric ways (Raffaetà). The papers in this session variously address these points and offer new insights about his legacy that open exciting prospects for anthropology today.

Presentation(s): Amalia Signorelli & Clara Gallini: "Brains and offal". The feminine legacy of Ernesto de Martino

Amalia Signorelli (1934-2017) and Clara Gallini (1931-2017) are considered "students" of Ernesto de Martino. Other women also participated in de Martino's ethnographic explorations, including Vittoria de Palma (1927-2024), Annabella Rossi (1933-1984), and Letizia Comba (1932-2000).

By retracing the life and work of Signorelli and Gallini, this paper seeks to illustrate how these two scholars were able to reassess their perspective through fieldwork and challenging the representation given by de Martino of certain female figures: "the peasant woman", "the tarantata", "the maschiara" "the lamentatrice". Signorelli and Gallini took an ethical-political stance deconstructing some stereotypes that stemmed from "the influence (and the misunderstanding) of De Martino's research". Signorelli's reinterpretation continued until 2011 when she published the journals from the 1959 expedition. Gallini's reevaluation spanned throughout her life, and it is particularly apparent in some of her monographs, such as the one from 1999, in which she published an interview with Vittoria de Palma, and her monographs (1981, 1983). This paper aims to demonstrate how these two scholars placed ethical-political commitment at the center of their work focusing on women's issues. In the vision of these women, "brains and offal" symbolized the union of scientific research, critical detachment, and passion.

Presenter(s): Zelda Alice Franceschi

Crises of cure: Ernesto De Martino and the environmental history of South Italy

In Puglia's Salento peninsula, residents have reported that tarantismo, a phenomenon of symbolic poisoning and ritual therapy, declined after agricultural herbicide use in the 1960s killed the arachnids putatively responsible for the poisoning. Colloquially referred to as medicine, petrochemical pesticides and fertilizers were introduced to "cure" adverse conditions of crop growth as the Italian state tepidly transformed a feudal agricultural system into a capitalist one. Rather than heal vulnerable plants, however, petrochemical technologies instead impoverished soils, leached heavy metals into the water supply, and conditioned possibilities for crop epidemic, especially the "rapid olive dessication complex" (CoDiRo) currently afflicting Salentinian olive trees. Petrochemicals' cultural status as curative therapies is challenged by crises ensuing from their own venomous side-effects.

For Ernesto De Martino, the study of symbolic poisoning marked a contribution to the religious history of Italy's South. Today, an inquiry into the effects of the land's actual poisoning highlights the South's environmental history. Against attempts to situate centuries of agricultural transformation as technological feats divorced from underlying material reality, today's crises of cure in Salentinian agriculture might be better framed as symptoms of an ill-reformed political economy, where growing food has always been an environmental means of structuring unequal social relations.

Presenter(s): Zachary La Rock

Fifty Days of Fieldwork: Figs in the World and the Unsettled Ghost of De Martino

Fig trees in Italy are dying due to an invasive weevil and climate challenges. This paper draws on fifty days of fieldwork to document human efforts to intervene in saving them. This paper speaks to profound relations that humans have not only with each other but with their plant brethren and the soil in which the trees grow or languish. The production of dried figs languished then was revived along with the abandonment then reattachment to the countryside. De Martino's concepts help grasp aspects of abandonment, attachment, loss, and belonging: *appaesamento*, a sense of feeling settled in which the world feels ordinary and familiar, and its opposite, *spaesamento*, in which the world feels bewildering and unfamiliar. How might De Martino's concepts be relevant to a multispecies anthropology?

Presenter(s): Elizabeth Krause

Ernesto de Martino Among the Anthropologists: Critical Ethnocentrism, Categories of Observation and Comparison

Ernesto de Martino's concept of critical ethnocentrism is important to contemporary anthropological epistemology because it makes us question our own (Western) cultural categories of observation. De Martino particularly focused on our awareness of concrete ways of living in society (e.g. cultural situations, choices or aspects) that we have encountered ethnographically. What I want to add is, firstly, that these encounters can be through our personal ethnographies or those of others and, secondly, that this perspective is relevant far beyond the Western/exotic paradigm in which De Martino originally developed it. Central to De Martino's reflection is the relationship between specific ethnographic realities and broader societal transformations, which, in turn, leads to a critical reflection on the limits of our own categories of observation. How might this perspective be especially relevant in distinguishing anthropology's perspective among the social sciences on topics of shared interest to several academic disciplines? How can critical ethnocentrism help us broaden theoretical discussions within anthropology by helping us see that existing wider issues in the literature can be studied from new, different vantage points or field sites? How can we bring critical ethnocentrism into dialogue with more recent, conceptually related work in anthropology and related disciplines, notably Michael Herzfeld's *crypto-colonialism* and Marcel Detienne's *constructive comparatism*?

Presenter(s): Samuel Shapiro

Going beyond the ghosts: nature and knowledge in Ernesto de Martino and the possibility for new alliances

I analyze Ernesto de Martino's thought within the decolonial and posthuman debate, drawing from ethnography across Italy and Hawai'i with (Indigenous) environmental scientists. De Martino pioneered the need to situate knowledge as an ethical and epistemological imperative. His critical ethnocentrism resonates with STS, anthropology, and Indigenous Critical Studies. As an Italian intellectual, he was influenced by Italy's peripheric position within major European colonial powers. Yet, as a man of his time, he advanced a historicist, humanist view of nature as immobile,

immutable and subordinate to culture. Engaged in a Eurocentric, secular, and colonial intellectual milieu, de Martino failed to grasp 'magic' and more-than-human forces as agents, ghosting key aspects of southern Italy's pre-Enlightenment knowledge. This neglect is part of how Eurocentric modern knowledge emerged—erasing both colonized peoples' contributions and European knowledge systems discarded by rationalist modernity. The colonial condition, often seen as past or external to Europe, has ongoing global ramifications. It shapes how European science perceives itself, forming a blind spot that limits its engagement with colonial legacies and its own displaced traditions. Revealing these ghosts enables new alliances across Europe and settler colonial contexts, unevenly connected through the colonization of knowledge.

Presentation(s): Distant doctors and invisible tumors: gynecologic oncology encounters in Romania

Medical encounters are sites of bodily scrutiny and intimate conversations. Clinical workers see, hear, and witness what no one else does. Drawing from fieldwork in an oncology clinic in Romania, I take this idea further, and explore the ghostly presence of distant doctors in the examination room. Women's bodies and the semiotics they encapsulate circulate from peripheries to the center, carrying (mis)diagnosis messages between unconnected doctors. The oncology specialists routinely receive small-town patients with advanced cervical cancers who have had inconclusive abdominal ultrasounds from local OB-GYNs but had never received a pelvic exam. Malignant tumors of 2 centimeters (0.7 inches) are detectable by the naked eye during a pelvic examination but can remain invisible to abdominal ultrasound waves. The technological, consumerist-driven medical investigations by small-town OB-GYNs are inscribed on women's bodies and deciphered

accordingly in the oncology clinic, where specialists encounter not only cancer patients but also their distant doctors.

Following spectral origin stories of COVID-19 in Bhutan: The multiversal politics of tendrel (dependent origination) and lenchak (karmic debt)

Political theorists and medical anthropologists have discussed the violence of state responses to the COVID-19 pandemic in divergent ways using the concepts of biopolitics and necropolitics. Rather than rehashing critiques of the state, liberal humanism, and neoliberalism, what could pandemic experiences in postgrowth contexts suggest about how interventions might be done differently in a geological epoch characterized by a climate emergency spurred by extractive, uneven growth?

Global health experts have raised Bhutan as a unique case study of pandemic management, with one of the lowest COVID-19 case fatality ratios in the world despite its proximity to India and China. But research on this case has tended to depict Bhutanese publics as unitary and compliant recipients of biomedical technologies like testing-tracing, mask mandates, and mass vaccination. These essentialist tropes recur in Himalayan literatures, and obscure the pluriversal histories and post-growth practices that made a rapid public pandemic response possible.

Based on participant observation, critical discourse analysis, and multimodal ethnography, the authors of this chapter present four particular features that have marked the Bhutanese case of health interventions during COVID-19: ritual digital technologies around vaccination and the virus, more-than-human redistribution, merit dedication and empirical displays, and land border sealing alongside food producer relinking. We trace in this distinct approach to intervention the logic of tendrel (dependent origination) and its dance with lenchak (karmic debt): an alternative to universalizing politics in which bodies are enacted as interdependent and indeterminate, and can be delinked from some flows to relink to the liberation of sentient beings.

Ghosts of Former Selves: Grief and Loss in the Context of Long COVID

"Long COVID" refers to a broad array of health problems and disabling symptoms that present in an individual after having been infected with the Sars-CoV-2 virus. In July 2021, the condition was recognized as one that could result in disability under the Americans with Disabilities Act (ADA). Though many biomedical studies had begun to investigate this condition, including some funded by the National Institutes of Health (NIH), Long COVID research is currently being deprioritized, so sufferers continue to manage their condition with little information or assistance from biomedicine. Many people in the U.S. with Long COVID no longer expect to recover, given the lack of available treatments and dearth of promising research.

Meanwhile, despite gains in visibility and public legitimacy, long COVID remains a contested illness, in which symptoms are trivialized or disbelieved by those in the sufferer's social contacts, including medical providers (Ware 1992). These factors together create a social milieu in which people with Long COVID must adjust to a new bodily reality while facing skepticism and disbelief from others regarding their symptoms and experiences.

Against this backdrop, people with Long COVID navigate not only debilitating physical illness, but intense social and emotional distress as they contend with what they have lost - physical abilities, relationships, visions of the future. This is compounded when Long COVID sufferers' social networks do not recognize or understand their mourning processes - which are understood to be important processes for reconstructing meaning and transforming relationships in the face of others' death (Silverman, Baroiller, & Hemer 2020; Neimeyer et al. 2014; Rosenblatt 2008) - in the absence of literal death. At times, participants feel like ghosts of their former selves while simultaneously feeling invisible to those around them. This paper draws from anthropologies of grief to explore Long COVID illness narratives, gathered through semi-structured interviews and participant observation, in order to better understand the complexities of this emerging chronic disease.

Presenter(s): Katherine Fox

Haunted Pathways: Cancer and Referral Reform in Tanzania

In 2019, the Ocean Road Cancer Institute (ORCI) in Tanzania introduced a policy I refer to as the level passing policy. This policy allows doctors across various tiers of Tanzania's health system to expedite suspected cancer cases directly to higher-level, specialized cancer care facilities. On paper, and in theory, the policy signals a rupture from earlier therapeutic pathways in which patients were required to move sequentially through all levels of care via referrals. Instead, it promises accelerated pathways, where certain levels are skipped to save time and improve treatment outcomes. In practice, however, the level passing policy at lower-tier facilities is haunted by the remnants of earlier health policies from both the socialist and market-driven eras: referral bottlenecks, institutional mistrust, and inadequate diagnostic infrastructures. For some patients and their caregivers, bypassing levels is not a choice but a haunted path, shaped by memories of friends and kin who died navigating the slow, cumbersome bureaucratic process; who encountered prohibitive costs and endured misdiagnoses. Thus, the level-passing policy should be understood not only as a procedural innovation but as a haunted policy that is shaped, feared, and improvised in the textures of everyday life. By extension, cancer emerges not merely as a somatic condition but as a spectral force- an index of historical legacies, institutional continuities, policy contradictions, and technological discontinuities.

Shepherds in the Shadows- the Local and Global in our Food System

The future of food production is, and will continue to be, a major challenge for humanity in the coming decades. The pervasive disastrous effects of industrial agriculture are well documented worldwide. The current practices of pastoralism in Lebanon constitute an intriguing paradox in such context of severe multifaceted crisis, war, food insecurity and critique of industrial agriculture. What does it mean for pastoralism to 'survive' despite it all? Survive to what and how? How does pastoralism differ from 'industrial' agriculture and what would it mean to frame it as an 'anti capitalist' and 'local' mode of production? Based on 12 months of ethnographic fieldwork conducted in 2023-2024 in Lebanon, this paper will seek to explore the current practices of pastoralism in the Mount Lebanon mountain range and its friction with the 'global' be it war, urban infrastructures, discourses or economic markets. By comparing the ethics and labour relations of a pastoralist family with those of an industrial goat dairy farm, it will show the conflicting take on biosecurity, efficiency, care and control. I will argue that what might differ between pastoralist and industrial modes of production rely on the very situatedness and complexity of the ethics and know-how, welcoming and composing with diversity and ambiguity rather than striving for total control, predictability and global uniformity.

Signed, sealed, delivered: Survey research as relational labor

This presentation takes population health science as a point of departure to explore how scientific practice makes knowledge. Specifically, I examine the epistemic cultures (Knorr-Cetina, 1999) driving clinical research about the unmet supportive care needs of adolescent/young adult cancer patients (15-39 years) in the United States. From 2020-2022, I carried out ethnographic field work on the upstart of a hospital-based Program to provide tailored services to youth who are diagnosed with cancer. The Program conducted a baseline needs assessment which I coordinated in my capacity as participant-observer. Survey administration involved an iterative process of identifying eligible participants in a retrospective cancer registry, mailing 1,300 paper surveys and pre-paid return envelopes to patients' homes, receiving and sorting returned completed surveys, entering responses into a database, and mailing participants a payment. Throughout this correspondence, I gleaned piece-meal information about the members of my sample – from their disease pathology to their hometowns, from their birthdays to their sexual orientations. In some instances, I recognized names from other initiatives in the Program. In other cases, I noticed return address labels with differing surnames to the patients' record, suggesting they may have gotten married since they were first diagnosed. In relating with these study participants – my interlocutors, per se – I built a world around the slivers of personal information I culled from disaggregated sources. I became attached to their stories, and I rooted for them as I crafted imaginary assemblages of recomposed persons (Tinkler et al. 2021). Most poignantly, respondents used the paper medium to pen rogue messages – to whomever they imagined me, the researcher, to be – in the margins of the survey. Such superscriptions were filled with uplifting messages, surprising disclosures, and heartbreaking confessions about young patients' unmet needs. Study participants, therefore, related to me as a similarly shadowy correspondent in this epistolary fieldwork. Survey research is rarely characterized as intersubjective between investigator and participant. Rather, data collection is

typically summarized in as an inventory of steps that "someone" on the research team carried out. My ethnographic findings, however, suggest that the assembly of a responsive clinical sample is a relational act; one that is steeped in affective and intimate sociality, however mediated or partial. I argue that applying an ethnographic lens to the production of clinical subjects unveils the materiality (sheer volume of paper), physicality (callouses and paper cuts from handling mailers), and affect (emotional investment in participant outcomes) inherent to the production of population-level data.

The Ghost of Oncology Past

For decades, pediatric cancer treatment has been a site of ambitious advocacy and research initiatives that have had a profound impact on the design and enactment of patient care. Historians of pediatric cancer treatment trace this history back to the figure of Sidney Farber, the pathologist who founded the Jimmy Fund Clinic, which was the first pediatric cancer treatment facility to incorporate the kinds of child-centered amenities (e.g., children's furniture, bright decor, toys and games, etc.) that are now standard features of pediatric facilities throughout the United States. Farber and his collaborators reimagined pediatric cancer wards, attempting to transform them from austere spaces associated with death. Throughout the twentieth century, many other pediatric oncology professionals and cancer advocates followed in Farber's footsteps, and pediatric cancer treatment centers became imbued with morally charged discourses of child-centered optimism. While these discourses have undoubtedly helped achieve many of their intended effects, such as compelling people to donate time and energy to the cause of pediatric cancer treatment and inspiring hope among children and families who are in the throes of cancer treatment, they have also had a number of unintended effects. In this presentation, I draw on ethnographic research with pediatric cancer treatment patients, professionals, and advocates to describe how the figure of the child cancer patient, which is so central to canonical discourses of pediatric cancer advocacy, haunts pediatric oncology in ways that distract from the needs of adolescent and young adult cancer patients, who often undergo treatment in pediatric facilities. In the past twenty years, however, professionals and advocates aligned with the "Adolescent and Young Adult (AYA) Oncology Movement" have begun to call attention to this situation, calling for new forms of AYA-centered cancer care in pediatric contexts. Building on work in medical anthropology and the anthropology of childhood, I show how these activists are engaged in ongoing attempts to generationally order oncological spaces and practices, attempting to foster patient inclusion along lines of age and developmental status. While these efforts are laudable, they have paid too little attention to the racialized, classed, gendered and otherwise multiplex nature of adolescence and young adulthood, at times projecting a homogenized figure of "the AYA cancer patient." Here I argue

that more detailed ethnographic attention to the complex lives of AYA cancer patients can help to dislodge such stereotypes and contribute to more careful modes of representation and recognition.

The Skin That Remembers: Cutaneous T-Cell Lymphoma and the Spectral Afterlives of Remission

Background: Cutaneous T-cell lymphoma (CTCL), a rare form of non-Hodgkin lymphoma primarily affecting the skin, is clinically understood as a chronic and relapsing illness. For many, remission does not signal reprieve, but ushers in a different kind of uncertainty—one marked by bodily hyperawareness, disrupted temporality, and an enduring sense of vulnerability. This study draws on anthropological hauntology to examine how illness becomes a form of haunting—embodied, affective, and unresolved—where the skin becomes both witness and archive to suffering.

Methods: This research draws from an ethnographic study conducted at a comprehensive cancer center in the southeastern United States. Thirteen individuals previously treated for CTCL participated in in-depth, semi-structured interviews. Interviews were transcribed, coded, and analyzed thematically using MAXQDA software. The analysis was guided by theoretical frameworks from anthropological hauntology, particularly Good, Chiovenda, and Rahimi's (2022) concept of spectral presence and Lincoln and Lincoln's (2015) distinctions between primary and secondary hauntings.

Results: Thematic analysis revealed three distinct yet overlapping dimensions of hauntological experiences among CTCL survivors. First, Haunted Flesh (85% of participants) describes how the skin becomes a site of dread and memory, haunted by chronic itch, pain, and the shame of visible disfigurement. Even after symptoms abate, the body remains marked and suspect, generating persistent hypervigilance. Second, Skin-Time (77% of participants) reflects the temporal distortions wrought by illness. For many, remission does not feel like recovery, but like suspension—marked by re-traumatization, and the looping return of symptoms both real and imagined. Third, Everyday Hauntings (100% of participants) describes how illness inhabits the mundane. From navigating medical appointments to attempting sleep, preparing meals, or responding to invitations, participants reported subtle, persistent disruptions that made ordinary life feel precarious and unfamiliar. The disease was not always visible, but it was never entirely gone.

Conclusion: Drawing on Stevenson's (2014) "life beside itself" and Gammeltoft's (2014) work on spectral presences, this study reveals how CTCL survivors experience recovery not as return to health but as a recursive condition where illness persists beyond remission. Their narratives reveal the skin as a haunted surface mediating between past suffering and present uncertainty, where everyday life becomes a spectral landscape through which illness continues to move—unseen yet deeply felt. CTCL generates an afterlife not of disease alone, but of embodiment itself, with survivorship characterized by symptoms lingering in skin, memory, and ordinary life. This study offers insight into how healing can be haunted, and how patients live not beyond illness but with it, alongside it, in the spectral rhythms of the everyday.

Unfolding Covid-19 Through the Ghosts of Past Epidemics: Denial, Uncertainty, Public Negotiation, and Retrospection in Pakistan

I will unpack how the Covid-19 pandemic unfolded in Pakistan through patterns shaped by the lingering specters of past epidemics. Drawing on ethnographic fieldwork conducted in Lahore, Pakistan, from March 2020 to July 2021, I explored how communities, healthcare professionals, and the state navigated the crisis in ways that were not entirely new, but haunted by familiar social scripts and institutional responses. Using Charles Rosenberg's dramaturgical model of epidemics as a heuristic, I trace the pandemic's narrative arc-denial, explanation, collective response, and retrospection-as it played out on the ground. This model reveals how epidemics are not only biomedical events but also deeply social dramas that echo earlier outbreaks.

I show how denial in Pakistan manifested in literal, interpretive, and implicatory forms: through conspiracy theories, rejection of biomedical knowledge, and the scapegoating of already marginalised groups. In the phase of managing uncertainty, people turned to practices like stockpiling, ritual prayer, and mutual aid-yet these strategies were shaped by pre-existing inequalities, particularly class and gender. Wealthier individuals had more means to cope, while the urban poor bore the brunt of lockdowns and health risks. Public responses were marked by uneven policies, often privileging elite urban centres while neglecting rural and informal populations. Healthcare professionals-especially doctors and nurses-became both heroes and casualties in a system stretched thin, and their experiences reveal how occupational hierarchies and gendered labour shaped the pandemic's toll.

Finally, in the stage of retrospection, I examine the vaccine rollout and the uneven terrain of trust, access, and acceptance. Here too, the ghosts of past state failures and health campaigns loomed large. Perceptions of the vaccine were filtered through histories of neglect and suspicion, reinforcing existing fractures rather than offering closure.

By attending to the dramaturgical unfolding of the pandemic in Pakistan, this paper argues that epidemics are not just moments of rupture, but reactivations of structural memory-where older patterns of exclusion, mistrust, and inequality return with renewed force.

7948 Ghostly Informatics of Cringe: A Discussion on the Somatic Representations of Haunting Awkwardness

Start Date: 11/21/2025 10:15 AM **through** 11/21/2025 11:45 AM

Venue: Marriott **Room:** Bonaparte

Type: Roundtable/Town Hall

Awkwardness-often dismissed as a fleeting social misstep or an aesthetic of discomfort-harbors

horror, melancholy, grief, and suffering. These states, read somatically, reveal profound cultural and epistemological dimensions. This roundtable brings together movement artists and dancers in academia to explore the informatics of cringe: how awkwardness, embarrassment, and bodily hesitation serve as critical signals of sociocultural and historical conditions.

Cringe, we argue, operates as a powerful affective archive that stores micro-failures, shame, subversion, and longing. By drawing on contemporary dance, somatics, and performance studies, panelists explore how awkwardness is cultivated in performance, pedagogy, and artistic research as a mode of inquiry. In an era of hyper-visibility and algorithmic surveillance-where "cringe" content circulates virally as a form of social control-we ask: What does it mean to be awkward now? How might movement practices reclaim and queer the aesthetics of shame, erasure, and bodily uncertainty?

Kimberly Powell examines how disability functions as a form of cringe and how disabled and Hard of Hearing (HOH) artists reclaim it as an intentional aesthetic and political strategy. She explores how ableist media casts disability as spectral, haunting representation through pity, mockery, and comic relief. These tropes, recently amplified in the public ridicule of disabled people, entrap audiences in cycles of secondhand shame and discomfort. Through autoethnographic and artistic methods, Powell situates her HOH positionality within critical disability performance studies to analyze how Deaf and HOH artists confront and subvert "cringe" as a form of resistance.

Julie Snyder shares findings from movement-based research with young performers exploring the somatic terrain of puberty and menstruation. Through collaborative choreography, participants stage their own "scene" of transition, confronting the aesthetics of leaking, changing, and uncontained bodies. Their performances reframe culturally inherited shame and rewrite dominant narratives about bodily emergence.

Yamuna Sangarasivam invites participants to move with the hauntings that result from intersecting and subjugating wars. Through speculative ethnography, she explores the kinesthetic terrain of ancestral regret, resistance, and resurgence, opening a space to inhabit nonlinear temporalities that mark the body through grief and remembrance.

Hortense Gerardo explores how awkwardness functions as a diagnostic threshold in Human | Robot and AI interaction. Through works such as *Dances with Robots* and *A Girl and Her Dog*, she examines how gestures of hesitation, uncanny mimicry, and bodily unease surface as indicators of trust, empathy, and recognition. These performances activate the Uncanny Valley as a somatic and choreographic site where awkwardness becomes data, exposing the limits of empathy, the thresholds of trust, and the poetics of imperfection.

Type: Oral Presentation Session

This panel takes the archive as a repertoire of dissent, where minor histories take center stage. We focus on Latin American resistance to state violence by asking how artistic and literary genres can elucidate archives of queer desires to live otherwise. Through explorations of sex work activism, artistic performances, migrant literature, and public spectacle we uphold these archives as generative forces that foster conditions for breaking away from heteronormative violence to propose alternative ways of narrating subjectivity. Inspired by Ann Cvetkovich's *Archive of Feelings*, we cast hauntings of past repressions that have remained at the margins of history yet contest practices of hostile government takeovers. In doing so, we consider the archive's own "pariah, transnational and migrant condition" (Guerrero 2023) to observe how it revolts against sovereign histories that contain and define it. In this panel's presentations, the repertoire of dissent is also in narratives that oppose male-centric historical accounts. In the scavenging task of reclaiming censored lifestyles, we present Latin American formations through feminist and queer frameworks that underscore collectivity and address what Adriana Cavarero (2000) posits: that narration is political because it is relational. We find these counter narratives in the form of anarchist testimonies in Argentina, traditional songs in Mexico, gay short stories in Cuba, and feminist performances in Bolivia. Through the lens of performance studies, we consider embodiments of desire that enable a politics of refusal. The multiplicity of such scenarios reminds us, as Diana Taylor (2003) claims, of the multiple systems of meaning-making at play. From anarchist refusals of Argentinian sex workers to poetic fabulations of Ecuadorian asylum seekers, feminist interpretations of "regional music" in Mexico, and radical street theater in La Paz, Bolivia, we examine how bodies and the intersubjective act of reading, writing, and worldmaking guide us into queering our analysis of the archives. The panel will ultimately create the space to share feminist and queer methodologies that write our collective actions against violence.

Presentation(s): Love at the End of the World: Sex Work Politics and Feminist Anarchy in Argentina

After the brutal repression of rural workers on strike in Patagonia in 1921, where 1,200 workers were shot, Colonel Varela, the military campaign's commander, decided to hire the sexual services of women from brothels near the ports to relax the soldiers' mental and emotional state. On February 17, 1922, in the brothel La Catalana in Puerto San Julián, five migrant sex workers refused their services to those soldiers as a form of protest. This refusal was violently repressed by the police and military, highlighting the power of bodies against institutional violence. In addition, hundreds of migrant strikers who identified as anarchists were imprisoned in local prisons or sent to Buenos Aires. This episode, narrated by Osvaldo Bayer, is part of *La Patagonia Rebelde*, revealing an integral part of minor stories to shape the anarchist history of Argentina. While organized sex workers today uphold this history as part of their activist trajectory, the current government destroyed the monument for Osvaldo Bayer, which read "Bienvenidx a la Patagonia Rebelde." This destruction identifies labor movements as a threat alongside the governmental delegitimization of inclusive language to put forth a renewed agenda of sexual and political repression. I consider the archive of the sex workers of San Julian to reflect on the current politics of sex work, the struggles of the labor movement, and the anarchic pasts that continue to infuse contemporary ideas of collective resistance and love.

Mujeres Creando and the Anarchist Politics of Refusal

This paper considers the public archive of Mujeres Creando, the Bolivian anarchy-feminist collective founded by Maria Galindo, Mónica Mendoza, and Julieta Paredes. Formed in 1992, the group has demonstrated a remarkable continuity for over three decades. During the early years, in an era of Bolivian neoliberalism, Mujeres Creando brought attention to anti-racism and LGBTQ+ rights, issues with which few others in Bolivia were concerned. It was, however, during the presidency of Evo Morales that Mujeres Creando drew increasingly more national and international attention through the widespread circulation of their public art, graffiti, and performances in online spaces. Further, their work confronted a political leader who many on the international left viewed as a source of hope, especially given his emergence during the continent's temporary shift to the left, what many scholars have called "the Pink Tide." This paper will consider Mujeres Creando's public performance archive as well as Galindo's body of written work to posit that the group makes manifest a politics of refusal. Mujeres Creando performs what Galindo has termed a politics "of the street," marking a distinction between the theoretical work that academics (and, to be sure, Galindo herself) engage in and the perceived proximity to "real" politics that the group enjoys due to public theater like the conversion of the centrally-located statue of Isabel la Católica into the Plaza de la Chola Globalizada.

Musical Cultural Production and Masculine Violence in Mexico

11 April 2025: Luis R. Conriquez announces during his concert in the municipality of Texcoco that he will no longer play narco-corridos. Chaos and aggression erupt: attendants jump onto the stage

and express their anger. The rules have changed, he later posted online. Not long before in Jalisco, Mexico, Los Alegres del Barranco projected an image of narco-leader "El Mencho" from Jalisco New Generation Cartel on stage. Local government officials argued for the prohibition of narco-corridos and their violent practices. Indeed, with Peso Pluma's stardom in the international music industry, narco-corridos have become a theme of debate: does it influence its listeners to commit acts of violence and shape youths' views to join the ranks of drug cartels? As the Mexican government addresses the rampant violence across Mexico, musical production is only one of their targets. In this paper, I am interested in the construction of masculinities in Mexican cultural production, from the 1940s in mariachi/rancheras songs to contemporary narco-corridos. I trace the concept "No rajarse," not cracking, given its historical importance in Mexican culture and query other cultural and linguistic figures of concern to address violence. Today, "no rajarse" continues to be a mode of performing masculinities. The question is whether, and to what extent, this public archive of cultural production shapes Mexican masculinities and whether it is constituting masculine violence in contemporary Mexico.

Calvert Casey and My Ethnographic Simulation

In the novella "Notas de un simulador" (1969), the Cuban writer Calvert Casey portrays the life of a bureaucrat obsessed with watching people die. Casey's brief corpus—this novella and sixteen short stories—queers predominant conventions of his time by estranging form and content. Literary critics have likened Casey's characters to the author's bilingualism, noting that his switch between Spanish and English evokes a sense of foreignness, an in-betweenness that linguistic registers fail to convey. In this paper, I reflect on Casey's queer storytelling as a means to interpret what I call "ethnographic simulation." Drawing from my experience as a Spanish-English interpreter for immigration lawyers and asylum seekers, I reflect on my roles as an ethnographer and former bureaucrat in Ecuador, alongside Casey's simulator and his writing self. In my work, living between languages refers not only to the phenomenological task of recounting testimonies of violence in English and Spanish—both in the first person—to experts and immigrants, but also to my role witnessing and participating in the injurious process by which asylum seekers' accounts are transformed into legal language. I conclude the paper by posing questions about simulation through a close reading of my epistolary exchange with Ada, an Ecuadorian asylum seeker. Together, we freely explore our relationship with fear and engage in imaginary arguments with "La Ley," an anthropomorphized representation of the law.

Venue: Marriott **Room:** Galerie 2

Type: Oral Presentation Session

Sexual and gender diverse communities are haunted by the futures and presents that might have

been and by pasts that refuse to remain in the past. This capacity for haunting is often tied to the legacies of the AIDS crisis (Hammons 2021; Møller and Ledin 2021; Muñoz 2019) and chattel slavery (Spillers 1987). We contend that these are but two of many specters haunting queer bodies. The scars of gender affirming surgeries (Malatino 2020), suppressed histories of personal and historical knowledge (Johnson 2005; Namaste 2000), the queer necropolitics of the present (Haritaworn, Kuntsman, and Posocco 2015), futures and presents of Black thriving lived and impressed into the past and the now (Allen 2022), records of legal gender marker changes (Currah 2022; Preciado 2020), the afterlives of slavery and its wake (Hartman 1997; Sharpe 2016; Snorton 2017) and the legacies of colonially- imposed gender norms in (post and not-post) colonial contexts (Gill 2018; Saria 2021; Tinsley 2018; Pyle 2019); each speak to queer encounters with ghosts and revenants at vastly disparate scales of time. Such affective intrusions of the past upon the present (Brennan 2004; Chen 2012; Stewart 2011) provoke us to consider how queer life is ontologically (hauntologically) affected and by what projects. In the most haunted city in America at a time when history for queer people seems to be turning back upon itself through the global rise of the far right, what can a queer hauntology offer to anthropology and to queer communities? Thinking with a queer of color critique (Ferguson 2003), our panel focuses on these queer hauntologies as they arise in communities across the globe from North American gender clinics to the Peruvian Andes and Irish cities. We ask: how are histories of colonialism and extraction made hauntologically present in contemporary queer contexts? What are we to make of these hauntings and their palimpsestic returns? Are such hauntings inherently negative or do they bring us closer to a network of queer ancestors across time and space? If queerness is haunted by the past, can it also be haunted from the future? Whose future is at hand when reckoning the timelines of pasts, presents, and yet-to- comes?

Presentation(s): Two-Spirit

Indigenous dancers aim to transmit multiple feelings to their audience while performing cultural dances. However, few studies explore how contemporary Indigenous people tell stories through nonverbal language to communicate feelings of strength, healing, and resilience. After attending the Two Spirit Gathering in Montana, I learned about the various roles of the Two Spirit people. I now realize that being a keeper of tradition is essential for my Two Spirit identity. The project integrates Indigenous identity into the dance to decolonize binary or Western-based influences. Using performance as the healing process for myself and the community allowed me to overcome generational trauma. Collaboration, an Andean value, was used to engage with family and the local community. This project revealed that stories of gender expression survived in Native American and

Indigenous cultural performances. The journey shares how gender expression in Andean dances may contribute to reducing social stigma and prejudice faced by Indigenous and Two Spirit people.

Haunted Embodiments: Disability, Gender, and Medical Authority in the Making of Trans* Identities

In this presentation, I argue that the fantasy of an idealized, "normal" (that is, non-disabled) body haunts our ways of knowing gender and, more presciently, our experience of a gendered self. I build from Rosemarie Garland Thomson's theorization of disability as inherently feminized and feminizing to consider disability as, even further, "intersexing," "ungendering," or "trans-ing" the subject. I first consider the production of a stable sex-gender binary through the haunting specters of ableist as well as racialized norms and cultural fantasies of visible and naturalized bodily difference. I then draw a number of parallels between discourses of trans*ness and discourses of disability, including the drive to "save" children by eliminating the condition (of queer/transness or of disability); the anxious cultural fantasy of self-evident difference; and the reliance on medical authority to know and to define the "truth" of identity. I then consider a number of parallels between discourses of disability and transgender "realness," both of which are overdetermined by the imagined self-evidence and visibility of the category (trans* or disabled) and, when that self-evidence is in doubt, by medico-legal authority. Finally, I provide an inroad for considering how medicalized and disabled embodiment and experience haunt our gendered subjectivities and identities, drawing on the works of intersex theorists such as Hil Malatino as well as my own such "hauntings."

The Stickiness of Touch: Intimate Labor in German Geriatric Care Homes

Sexual assistance and sexual surrogacy blur the boundaries between sex work and care in Berlin's geriatric care facilities—neither fully institutionalized nor entirely disavowed. This paper explores how such forms of intimate labor inhabit a liminal space where aging, desire, and care converge yet remain haunted by the sticky norms that constitute professional touch in geriatric spaces. These norms adhere to bodies and relations, shaping which forms of touch and pleasure are expressible and which remain deferred or disavowed. While often framed as enabling dignity and autonomy, sexual assistance also bears traces of extraction—especially from feminized, racialized, and precarious bodies. These tensions rarely surface as direct confrontations but more often as lingering hauntings—in the institutional silence around sex work, in the unease of naming desire, in boundaries that never fully hold. Yet rather than simply extending rights or recognition, these practices become sites of queer utopian tinkering—fleeting, relational efforts to imagine care otherwise. Drawing on feminist notions of care as situated practice (Mol et al. 2010) and theorizations of queer futurity (Muñoz 2009), this paper argues that sexual assistance opens space for alternative futures: fragile, affectively charged, and sustained in the labor of those who continue to imagine care beyond the hauntings of institutional respectability and prevalent sexual morality in geriatric care spaces.

Presenter(s): Christopher Zraunig

Ghosts of Straight Futures

This paper considers how trans youth become haunted by their own possible futures. Drawing on ethnographic fieldwork among young people and providers of medical gender affirming care, I describe how the process of negotiating medical intervention often invokes the spectre of the future adult self who "regrets," a ghost primarily drawn from the fear and anxieties of parents and adults who preemptively mourn the loss of a young person's normative future as they see it. I argue that this form of haunting is particularly meaningful in the United States in the contemporary political moment, when medical care for trans youth is being restricted and banned nationwide. While the legacy of research on "desistance" continues to over-determine the legitimacy of statistics on transition, providing weight to historical fantasies where youth willingly came to embrace their cisgender future with the right pressures, the turn toward the future enables a more fantastical charge of harm. In other words, such a dynamic is used as a model to cultivate an affective logic which pits the desires of youth against the imagined past desires of their future self; a ghost whose political presence, in the present, is taken so often as more real and meaningful than any current, material position a young person holds.

An Inventory of Ghosts: Haunting, obligations, and ancestors in the Irish Queer Archive

Haunting is not always a negative experience. In this paper I utilize both the materials in the Irish Queer Archive and my own reflections on the process of working with them to theorize different forms of queer haunting: the gaps in knowledge and memory left by a generation lost to AIDS and emigration, the past predictions of futures that could not be realized, and the ghostly vestiges that mark sites of queer sociality in Dublin. Guided by both ethnographic approaches to the archive (Dave 2012, Stoler 2010) and archaeological literature on heart-centered methodologies (Supernant et. al. 2020), I argue that haunting can be a productive way to connect with the historical dimensions of our field sites and to consider how the past remains contained within the present conditions we arrive to find in the field. Moreover, I contend that haunting makes present our ethical obligations to these histories, and allows us to consider what we owe not just to our interlocutors on the ground now but also to those whose work precedes us.

4105 Presidential Panel: Emerging Scholar Reflections from the Concha Delgado-Gaitán Fellows

Start Date: 11/21/2025 10:15 AM **through** 11/21/2025 11:45 AM

Venue: Marriott **Room:** Galerie 3

Type: Conversation/Debate

This conversation brings together the 2024 Concha Delgado-Gaitán Presidential Fellows, awarded by the Council on Anthropology and Education, to reflect on our experiences in the program and

share our perspective on the legacies, present, and futures of the field of educational anthropology. This year's AAA theme invites us to consider the ghosts that haunt our field: the foundational texts that we take up and critique, the institutional structures that scaffold and constrain the production of knowledge, the ethical dilemmas we inherit and work through, the educational inequalities that persist and have been intensified despite decades of activism and scholarship. Our interdisciplinary research interests range from land-based pedagogy and critical language studies to educational policy and international education, but is united by an ethos of contributing to the movement toward social justice for the communities we work with and are accountable to: Indigenous, immigrant, and refugee communities on Turtle Island and across the Global South. Yet we are entering positions of academic power at a time where these/our communities are facing criminalization, persecution, and genocide, and where there is unprecedented repression against professors whose work engages such enduring critical questions, with consequences ranging from censorship to firing to abductions to physical violence. We find ourselves grappling with how to honor the spirits of our intellectual pasts, build and resist alongside the mentors of our present, and make space for new, liberated futures to develop. What does mentorship look like when it is conceptualized as more than professional development but as a negotiation of remembrance and reconstruction of the field? How do we mentor each other and our students in ways that honor our training while also opening fissures through which alternative epistemologies can emerge? How do we manage the balance of action and safety as we position ourselves in the fight against political and ideological attacks on our students, colleagues, and institutions? In the spirit of Concha Delgado-Gaitán's legacy of impact on social justice research and activism, we will use this conversation with each other and our senior colleague, Denni Blum, to reflect on the importance of sustaining multi-generational scholarly communities through efforts such as this fellowship, especially as our collective repression intensifies.

3855 Haunted by the Play Spirit: A Roundtable on Games in Anthropology

Start Date: 11/21/2025 10:15 AM **through** 11/21/2025 11:45 AM

Venue: Marriott **Room:** Galerie 4

Type: Roundtable/Town Hall

Games have seen a resurgence in anthropology from #AnthropologyCon from 2017-2019, to the establishment of the International Network of Sport Anthropology in 2023, followed in 2024 with the founding of the AnthroPlay network and their inaugural conference focused specifically on anthropological modes of play, and particularly playful ways of exploring anthropology. Inspired by this energy, this executive roundtable session brings together anthropologists to talk about the

importance of games in how the immaterial ghosts of culture become tangible through the medium of play. Nicholas J. Mizer (Rensselaer Polytechnic Institute), Fiona P. McDonald (University of British Columbia), Krista Harper (University of Massachusetts Amherst), Andre Tarleton (University of Massachusetts Amherst), Elliot Wiseman (CUNY), Zihan Feng (Rensselaer Polytechnic Institute), Kellyn Wee (University College London), and Tom Boellstorff (University of California, Irvine) open a timely conversation on what it means to be haunted by the "play spirit" (Huizinga 1949, Graber 2014) when conducting ethnographies of games, utilizing games and play as research method, thinking with games as ethnographic communication, engaging with games as pedagogy, and deploying games in applied contexts as social change agents. In recent years, new considerations of Dutch Historian Johan Huizinga's *Homo Ludens* have drawn attention to a ghost of anthropology's past for the ways that anthropologists have overlooked his claims that play stands at the origin of human culture (Szokolczai 2012), and that play scholars' formalist definitions of play have missed Huizinga's phenomenological investigation of the play spirit as a force that animates human behavior (McDonald 2019). Because play is not limited to humanity (Bateson 1973), the play spirit (and spirit of play) also connects the human and non-human in ways that also give affordances to address the environment, community, political imagination, queer identities, and world-making. This roundtable considers games as modes, texts, and methods from telling ghost stories, to interactive tabletop games, to digital gaming, to revisiting the concept of deep play (Geertz 1973), to metacommunication (Bateson 1973), and play spirit. This roundtable creates a "magic circle" in which to unpack the praxis of games that illuminates current discourse around the multimodal (Collins et al 2017, Collins & Durlington 2024; Fariás and Críado 2024) where games of collective imagination open up new possible futures (Benjamin 2024), but recognizing that play does not automatically mean good things, especially amidst the dark games of empire, capital, and anti-Black Racism (Trammell 2023).

2545 The Specters and Continuing Legacies of Mesoamerican Anthropology's Forebearers

Start Date: 11/21/2025 10:15 AM **through** 11/21/2025 11:45 AM

Venue: Marriott **Room:** Galerie 5

Type: Roundtable/Town Hall

Anthropological knowledge of Mesoamerica has been shaped by internal and external influences that predate and continue after the arrival of Spanish colonizers. Surviving Maya, Aztec and Mixtec

codices, the Popol Vuh, and archaeological sites provide insight into complex and sophisticated civilizations. Even contested European accounts of these cultures – e.g., Bernardino de Sahagun's Florentine Codex and Spanish conquistador Bernal Diaz del Castillo's *Historia verdadera de la conquista de la Nueva España* – have enriched ethnohistorical and adjacent disciplinary scholarship of central Mexico. In subsequent centuries, detailed drawings by Frederick Catherwood's and John Lloyd drew attention to the Yucatec Maya region, while French politician Charles Brasseur de Bourbourg described his impressions of southern Mexico and Guatemala. These portrayals complement the pioneering archaeological explorations of Franz Boas' students Manuel Gamio and Alfonso Caso, and the influential research of 20th century ethnographers employed by prestigious research institutes such as Mexico's Instituto Nacional de Antropología e Historia (INAH). Similarly, early Guatemalan anthropologists like Antonio Goubaud Carrera and Joaquín Noval helped reshape national attitudes about Mayas and forge fruitful collaborations with Mexican, European and U.S. anthropologists via the Instituto de Antropología e Historia de Guatemala. The profound legacy of these and other luminaries too numerous to name here cannot be overstated.

In keeping with the conference theme, participants in this roundtable pay homage to the early scholarship of this culturally and linguistically diverse region whose lasting impact on the discipline and allied fields continues to influence our research. Each panelist outlines the ongoing legacies of a particular notable Mesoamerican or Mesoamericanist anthropologist. Ana Ortiz discusses Alfred López Austin's influential research on Nahua mythology and cosmovision. Sarah Taylor focuses on the legacy of Robert Redfield's watershed analysis of rural life in the Yucatán Peninsula. Jayne Howell remembers Beverly Chiñas' feminist ethnography of Isthmus Zapotecs and Pedro Carrasco who encouraged her to read it. Miguel Vassallo is inspired by Robert Carmack's monumental ethnohistoric research on the Quiche Maya. Walter Little recognizes Sol Tax's and June Nash's respective seminal research on Maya identity and economics in Guatemala and Mexico. Discussants Bill Wood and Ken Seligson contextualize these talks relative to Michael Kearney's and William Ringle's enduring legacies in this region, including the relationship between Mesoamerican ethnography, ethnohistory and archaeology.

We welcome open discussion of the debt we owe the "ghosts" of anthropologists past who have shaped current scholarship within and beyond Mesoamerica.

1938 Political Life in the Middle East across the Revolution or Reformation of Tradition

Start Date: 11/21/2025 10:15 AM **through** 11/21/2025 11:45 AM

Venue: Marriott **Room:** Galerie 6

Type: Oral Presentation Session

Are traditions to be preserved, reformed, or overturned? Papers in this panel explore the intersection of traditions, social change, and political transformation across the contemporary Middle East. While revolution and reform name distinct and often counterposed political processes, the discourses and practices surrounding them often produce shared effects—scattering, reorganizing, superseding, and transforming traditions. This convergence makes it worthwhile to consider their resonances and dissonances together. Such dynamics offer rich empirical sites for examining temporal assumptions that link the past, present, and future in varying ways, often articulated through notions of ghosts and hauntings, such as the specters of communism, Baathism, and the Ottoman Caliphate. Key questions to be explored by this panel include: 1) How do people inherit or take up traditions in times of political uncertainty and social change? 2) What are the structures of debates on traditions animated in times of revolution and reform? 3) What temporal assumptions about the past, present, and future emerge in the reconfiguration of traditions through revolution and reform?

Presentation(s): Atheism, Extremism, and the Specter of Doubt in Contemporary Egypt

In his 2014 review of *Ethnographies of Doubt* (2013), Martin Frederiksen offers the provocation that anthropological studies of doubt often focus on believers. In his view, if focused on "agnostics or even atheists," a "more perpetual" form of doubt may emerge. This paper explores the perception among religious leaders at Egypt's al-Azhar that it is precisely this "perpetual" form of doubt that makes atheism a rising, alarming threat. Whereas atheism is often framed as a rejection of belief, in this context it emerges instead as a sneaking uncertainty. What does the movement to atheism entail, and in what ways do those at al-Azhar position themselves as guarding against it?

Ethnographically, answering this question involves complicating common understandings of extremism to apprehend how my interlocutors consider atheism a form of extremism that threatens Egypt's societal telos. In this context, discussions of "the two poles of extremism" are common, with workshops, film viewings, and lectures organized to interrogate the poles. Exploring these

programs and the responses to them by diverse Egyptians, I examine how my interlocutors understand the term extremism, under what circumstances atheism takes on such associations, and the roles of doubt and uncertainty in their construction. Beyond providing insights into an increasingly powerful movement in Egypt, this work seeks to sharpen scholarly understandings of faith and doubt, and the movement from one to the other.

Presenter(s): Erin Atwell

Haunted by the Past: Salafi Women, Zār Rituals, and the Ghosts of Family Tradition

Salafism is often framed as a rupture from local cultural and familial traditions, enforcing a strict doctrinal framework that rejects pre-Islamic and "superstitious" practices. Yet, during my fieldwork, I observed a striking contradiction: some Salafi women in Egypt continue to attend Zār rituals, a spirit-possession ceremony explicitly condemned by Salafi scholars. This paper explores how these women navigate the tension between their ideological commitment to Salafism and the ghosts of their past—the lingering presence of family traditions, inherited memories, and the weight of social belonging. Engaging with this year's AAA theme of ghosts, I argue that Salafi converts are haunted by the very past they seek to leave behind. The specters of family and cultural heritage intrude upon their efforts to conform to a purified religious doctrine, creating both resonances and dissonances—between belief and practice, between religious reform and the persistence of ritual. Their attendance at Zār ceremonies reveals that traditions are never entirely erased but continue to resurface, reshaped, and reinterpreted. This paper examines how these women negotiate the contradictions between the spectral pull of their inherited worlds and the demands of their chosen faith, offering insights into the unsettling endurance of "forbidden" practices within contemporary Salafi communities.

Presenter(s): Naïma Bouras

Inheriting Failure: Thinking Tradition and Revolution from Lebanon

This presentation sets out from some remarks made by Lebanese Marxist theorist Mahdi Amil (1936-1987) in his posthumously published writings on revolution and religious tradition. Writing near the end of Lebanon's fifteen-year conflict (1975-1990) and during the consolidation of Islamist militias and the waning of his own Lebanese Communist Party, Amil averred a "hidden" connection between Islamic Sufism and "materialist thinking." Specifically, Amil argued that it was Sufism that bore the "failure" of a revolutionary movement, the crystallization of a negating force vis-à-vis the seemingly eternal "law" of this world. Inheriting the specter of Sufism's failure thus becomes inheritance of *naqđ*, the negation of a prevailing order, as a materially existing force—a real movement. This presentation, in a time of war, genocide, and revolution in the Mashriq, asks what it means for anthropological thinking to attend to the real movement of contradiction.

Presenter(s): Aaron Eldridge

The Struggle for Images

This paper elaborates on the Syrian anonymous film collective Abounaddara's film *The Iimagemaker* [2024] and the accompanying essay "Waiting for Resurrection," using them as guides to develop a way of looking anthropologically at the symbolic function of political authority. By 'symbolic function,' I mean the logic of images and the way they give shape to the world, following the lead of the philosopher Ernst Cassirer. The paper, following Abounaddara's path, then moves from the work of the contemporary film collective to the 12th century Islamic thinker Shihāb al-Dīn Suhrawardī, the philosopher of light, before ending with some brief reflections on the present via one of the intellectual founders of the Syrian Baʿth Party, Michel ʿAflaq. At the paper's core, it explores the struggle for images as a part of an always ongoing struggle of images as narrated through the history of Syria in relation to political power amidst times of revolution and reform in the Levant.

Presenter(s): Brent Eng

The Gendered Reform of the State Fatwa in Turkey's Authoritarian Trajectories

This paper examines the reform of the Turkish state fatwa through the creation of the "Family Bureau." This reform has institutionalized state-appointed women preachers as gendered state agents since the early 2000s. Drawing on ethnographic research and interviews, I analyze how the reform's architects framed the "needs" of observant Sunni Muslim women in light of their experiences under authoritarian secularism imposed by repeated military interventions. While initially rooted in situated and gendered memories of this political violence, the notion of "needs" has since transformed into a flexible, dehistoricized, and de-gendered placeholder within bureaucracy. I argue that this transformation has been crucial for the notion to continue to structure the everyday work of state women preachers under the current Justice and Development Party regime. To analyze the (de-)gendering and (de-)abstraction of these "needs," I draw on theories of translation as a process of discursive repetition that simultaneously preserves and transforms social meaning. In so doing, this paper contributes to debates on bureaucratization and its impact on religious life, questioning whether bureaucracy inevitably leads to standardization and the erasure of human differences. The paper situates these dynamics within the broader study of commensuration as a social process and the shifting effects of state power.

Presentation(s): Cyber Crimes, Paper Law: Ethnography of a Cyber-Station in India

In the last decade, India has seen a dramatic rise in cybercrime, with cases reported across the country increasing at an alarming rate. In 2019, an average of just 71 cybercrime complaints were filed each day. In 2024, that number had soared to 6,175 daily complaints, an astonishing 87-fold increase. The Ministry of Home Affairs informed India's parliament that, by August 2024, India's national cybercrime reporting helpline, '1930,' had received around 760,000 complaints. Additionally, The Economic Times reported that in just the first four months of 2024, Indians lost 17.5 billion rupees to cyber fraud. Independent experts and senior police officers have publicly said that the actual figures might be around 10 times these official numbers as most crimes go unreported. To cope with this alarming situation, specialized police stations called "cyber-stations" have been set up in around 300 districts with a mandate to investigate crimes committed via the internet. Most police ethnography in India and across the world has focused on studying the public interface of citizen-police interactions in various permutations and combinations. The pre-trial investigative and clerical processes of the police force remain an under-examined area in the anthropology of law and policing. This paper addresses this methodological challenge by opening the black box of a station and ethnographically studying the internal processes of a cyber-police station in a semi-urban, Hindi-speaking district in North India. While studying these internal processes in the highly technologized environment of a cyber-police station, representing the cutting-edge law enforcement frontier of an increasingly digitalizing India, this paper explores the dialectic between law and technology. On the one hand, it demonstrates how the use of advanced computing and communication technology has radically transformed the investigative methods of the police in India by massively increasing the surveillance capacities of local law enforcement. On the other hand, by granularly zooming in on the clerical tricks, narratological techniques, legal codes, and protocols involved in the construction of police case files for the courts, this paper argues that this technological innovation is constantly tamed and domesticated by the older paper-based regime of law. Lastly, by studying the police force navigating dual registers of digital and paper simultaneously, at a time when law enforcement institutions in India are rapidly integrating digital media technologies into their everyday work practices, this paper utilizes this unique time window to reflect on the tensions and dilemmas that arise when bureaucratic institutions change their means of information production.

Presenter(s): Shikhar Goel

HAUNTINGS OF RACELESSNESS: EPISTEMOLOGICAL VIOLENCE AND ROMA

POLITICAL AGENCY IN TURKEY

The Turkish state has historically framed marginalized communities, including the Roma, through top-down categorizations that reinforced its nation-state-building project, strategically denying them agency over their (re)presentation and decision-making processes. This paper interrogates

the epistemological violence embedded in such frameworks by employing the concept of hauntings to analyze how suppressed histories and unresolved power dynamics persist in shaping present-day narratives. For example, liberal historical narratives obscure the colonial and racialized structures that marginalize Roma communities, influencing how their identities and agency are framed. By invoking hauntings, I reveal how the erasure of race and coloniality in discourses of social science in Turkey continues to shape Roma lives and their political possibilities. These hauntings expose the contradictions within liberal narratives that perpetuate the myth of racelessness (Rucker-Chang and West Ohueri, 2021), obscuring the racialized dynamics underpinning Roma marginalization. While Rucker-Chang and West Ohueri critique the rejection of race in Central and Eastern Europe, I extend their analysis to Turkey, where race is similarly disavowed in understanding marginalization. However, the Turkish context introduces unique dynamics: Roma communities are positioned as both a denigrated, racialized minority and a "model minority," often contrasted with securitized groups like the Kurds. I argue that this dual positionality reflects the Turkish state's strategic use of race-making to manage populations, simultaneously deploying inclusionary rhetoric and exclusionary practices. Poverty discourses and "social pathology" frameworks depoliticize Roma struggles while reinforcing their racialization. This paper examines how the myth of racelessness operates in Turkish social science knowledge production, particularly in studies on Roma communities, by rethinking my own academic experiences. Social science disciplines, including sociology, political science, and social work, serve as key sites for reproducing racelessness, often aligning with state projects that prioritize national unity while denying racial and colonial frameworks. These disciplines shape marginalized groups as political entities, social categories, or subjects of intervention, reinforcing epistemological violence. By analyzing social science studies, I explore how these fields collectively obscure race-making processes and sustain racelessness in Turkey, reducing Roma to socioeconomic actors divorced from histories of racialization and coloniality.

Presenter(s): Tuba Akin

Hevalti and the Politics of Intimacy: Friendship as a Foundation of Contemporary Kurdish Mobilization

This presentation explores the concept of hevalti (friendship/comradeship) and its critical role in the contemporary Kurdish political movement, based on ethnographic field research in Diyarbakir, Turkey's most populated Kurdish city. By focusing on Kurdish young revolutionaries, the paper examines how hevalti serves as both an intimate bond and a political force, shaping collective identity, solidarity, and resistance. Rather than seeing political mobilization as purely an ideological or strategic endeavor, I argue that hevalti forms the emotional and relational foundation of Kurdish resistance movements, fostering solidarity through personal and collective ties.

Approaching hevalti as a form of political intimacy, this study positions friendship as a dynamic and empowering practice that transcends individual relationships to sustain collective political mobilization. This paper is informed by ethnographic fieldwork conducted in Diyarbakir, where I engaged with Kurdish youth involved in the Kurdish political movement in the 1990s. Through

interviews with former Ziya Gokalp High School students, a key site of Kurdish youth mobilization, and archival research, I investigate how hevalti enables the formation of solidarity networks that defy state repression and marginalization.

The contribution of this paper lies in its examination of hevalti as an intimate yet political practice, revealing how personal bonds and friendships are central in shaping Kurdish political identity and resistance. By exploring hevalti's role in the formation of political subjectivities, this paper underscores the significance of relational and emotional dimensions in the ongoing Kurdish struggle for justice, autonomy, and recognition.

History And Role Of A Feudal Regime In Neighboring Districts: A Case Study Of Sargodha, Jhang And Chiniot

Feudalism refers to a dynamic socio-political and economic system in which possession of land is the driving force behind power or authority, with a hierarchical framework. This research highlights the fact that feudalism still continues to exert its control over rural populated districts of Sargodha, Jhang and Chiniot (Pakistan) despite of democratic functional order. This paper examines how feudalism, specifically in the form of lambardara nizam (Feudal regime) in these districts, continues to persist and influence the governance. With the help of qualitative analysis, the research truly depicts the essence of feudalism in these regions and how tradition is in transition. Despite this fact, feudalism poses to be resilient highlighting the weak institutional apparatus which can be seen as a limitation of democratic governance in Pakistan. Taking into account these dynamics, this research demands influential reforms and strong governance to ensure an inclusive system.

Presenter(s): Muhammad Bilal Ali

Infrastructural Uncanny: War Preparedness and Development in Turkey

How do competing political projections, economic motives, and security rationales inform infrastructural policies? How do state actors project infrastructural imaginations into the future when the present is under duress? This article explores these questions by looking at infrastructural development in Turkey through multi-sited archival research and fieldwork. Based on evidence from the late Ottoman period to the early Cold War, it claims that infrastructures are ambivalent and can take on uncanny qualities, particularly in moments of crisis and liminal spaces. It also argues that state actors may seek to implement highly curated forms of infrastructural posturing rather than indiscriminately project infrastructural power across the national space, in recognition of the modern predicament that the infrastructures undergirding our daily lives can also unravel them. It mobilizes the term tactical development to delineate the Turkish response to this dilemma and its lasting consequences, particularly in borderland areas. Finally, the article focuses on the question of infrastructural ideology, demonstrating the importance of identifying how various actors distinguish between different infrastructures, weigh their utility against costs and risks, rank their benefits, and propagate beliefs about what infrastructure is ultimately good for. It argues that we

must take the question of infrastructural ideology seriously to understand the making of infrastructural presents and their long-lasting legacies.

Temporal Displacements and the Making of the Provocation Narrative: Alevis and Secularism in Turkey

This paper focuses on what I call the provocation narrative in Turkey—an enduring explanatory framework for religious discrimination against the Alevi religious minority. This narrative frames attacks and assaults on Alevis as the work of a handful of instigators, effectively obscuring the state-sponsored, structural marginalization the community has faced since the founding of the Turkish Republic in 1923. I trace the emergence and evolution of this narrative from the 1940s to the present, focusing on three key historical moments that shaped it: early republican secularization policies (1923–1945), the transition to multi-party politics (beginning in 1947), and the rise of Marxist-communist activism in the 1970s. I use displacement as a framework to examine the relationship between past and present. My ethnographic research with oppositional journalists in İstanbul (2014–15) first brought the provocation narrative to light. However, it was only through archival ethnography that I uncovered its deeper connection to the early republican discourse of secular rupture. The link between Turkey's secular framework and the provocation narrative was not initially evident, as the term provocation was absent from public discourse during both the early republican era of secularization and the subsequent multiparty period. Instead, other terms—such as "discord," "incitement," "agitation," and "sham"—were commonly used. Provocation only entered public discourse in the 1970s, amid the rise of communist activism and anti-labor crackdowns. By tracing these discursive displacements over time, I will show how the provocation narrative misrepresents its own past as having originated in the 1970s. In so doing, I will highlight how the provocation narrative constructs a temporality that obscures its roots in Turkey's secularization, thereby concealing the state's role in the marginalization of Alevis—and how, like a ghost, this narrative continues to haunt the present, masking structural violence behind the uncanny appearance of spontaneous discord.

3623 Unearthing Healthcare Ghosts: The Four Fields of Anthropology Confront Inequalities in Health and Healthcare

Start Date: 11/21/2025 10:15 AM **through** 11/21/2025 11:45 AM

Venue: Marriott **Room:** MGB - Salon B

Type: Oral Presentation Session

Anthropology has long recognized the cultural and historical dimensions of health and healthcare. The COVID-19 pandemic, however, renewed attention to enduring legacies of inequality, structural violence, and systemic exclusion within global healthcare systems. These healthcare ghosts appear in many forms: inherited inequities; lingering distrust in biomedical institutions; and shadows of past pandemics haunting present-day realities. They also emerge in community-based

care, where traditional practices coexist-sometimes in harmony, sometimes in tension-with biomedical systems.

In this session, we propose that a four-fields approach offers critical insights into how healthcare is shaped by culture, language, biology, and the medical practices and beliefs of the past. Drawing from all four fields, our diverse group of scholars aims to unearth hidden histories, amplify marginalized voices, and explore healthcare's deep entanglement with historical and cultural contexts. The papers in this session collectively focus on metaphorical and material ghosts within healthcare landscapes, using a critical lens to reveal how history continues to shape health outcomes.

The papers in this session demonstrate the strength of this four-fields approach through ethnographically and temporally diverse studies, including: an exploration of how beliefs in witchcraft coexist with biomedical suspicion to shape healthcare access for the Awajún Indigenous community; groundbreaking work on vaccine knowledge and hesitancy among Hadzabe hunter-gatherers during COVID-19, which highlights barriers to health information and healthcare access; a theory-driven assessment of "the bioarchaeology of care," offering concrete steps toward more holistic interpretations of health and healing in the past; a linguistic analysis of Chinese government propaganda in Wuhan during the pandemic's early days, exploring how top-down healthcare messaging haunts local perceptions of trust and health; a historical archive study of pseudoscientific dietary interventions in turn-of-the-20th-century psychiatric hospitals, with implications for contemporary paradigms of health and diet; and an examination of how the ghosts of medical institutional violence can be reconciled by integrating anthropology and translational health science.

Together, these papers illustrate how a four-fields perspective enables deeper and more nuanced understandings of the persistent disparities in health and healthcare. By bringing together distinct yet complementary approaches, this session fosters critical engagement across subfields and disciplinary boundaries. In doing so, it opens space for collaborative research and invites new questions that address the complex, multifactorial roots of health inequality.

Presentation(s): Witchcraft and HIV: Sorcery, Suspicions, and Barriers to Healthcare Among the Awajún of the Peruvian Amazon

The Awajún are an Indigenous population primarily residing in the northern Peruvian Amazon. In this paper, I describe the medically pluralistic nature of healthcare in the study community, with attention to how historical changes and evolving beliefs in sorcery have compromised access to both traditional and biomedical healthcare. The data presented are derived from one year of ethnographic research conducted among the Awajún in 2013. Through participant observation and semi-structured interviews (n = 42), I found that community members frequently attributed sickness to witchcraft. However, traditional healthcare was prohibitively expensive as local shamans were pushed out of Awajún communities by American Evangelicals over the last few decades. Additionally, a long history of exploitation by outsiders links to significant suspicion being expressed about the nurses working in the local healthcare post -- impeding access to biomedical care and preventative screenings. Thus, beliefs in sorcery and witchcraft in combination with suspicions of the health post created substantial barriers to accessing both biomedical and traditional care. The confluence of these dynamics is highly problematic, especially in regard to surging levels of HIV transmission among the Awajún. I conclude the paper by discussing recent research showing extremely high rates of HIV infections in Awajún communities and the urgent need to integrate anthropological insights into health promotion.

Presenter(s): Paula Tallman

The Anthropology of Translational Science: Reconciliation and Rebuilding Trust in Clinical Care

Clinical medicine has a sordid history of institutional violence – mistreating, misappropriating, and otherwise misusing the bodies, minds, and souls of under-recognized persons. Echoes of these misdeeds linger well into the present, affecting individual and community health, wellbeing, and joy. Translational science, the field of study that explores how to make the translational process (moving research from bench, to bedside, to clinical practice, and policy) more efficient and representative. Current translational science is primarily the purview of clinicians, epidemiologists, and public health professionals, with fewer social scientists engaged. The field is ripe for a new wave of holistic anthropological translational scientists with perspectives rooted in the past, present, and looking towards the future. We will explore how an anthropology of translational science can reconcile and rebuild trust in clinical medicine by incorporating community perspectives in clinical trials, public health, and policy recommendations.

Presenter(s): Amber Osterholt

"I don't know the good of it, but my children were vaccinated": Hadzabe vaccine hesitancy and the balance between biomedical access and mistrust

Vaccine hesitancy was identified as a key threat to global public health by the WHO before the COVID-19 pandemic and remains a critical area of research and intervention among Indigenous populations. This is particularly true for hunter-gatherers, whose mobile lifestyle compounds barriers like marginalization, medical mistrust, and limited vaccine knowledge. However, little is known about vaccine attitudes in these groups. This exploratory study investigated vaccine knowledge and perceived safety and efficacy among Hadzabe hunter-gatherers of Northern

Tanzania. Ninety-one adults (mean age = 39) in six bush camps were surveyed about their understanding of vaccines, safety, and efficacy. Half of participants reported not knowing what a vaccine is, while one-third described vaccines as protecting health or preventing disease. Many (32%) were unsure if vaccines are safe. Most (72%) agreed vaccines are important for children, though opinions varied for adults. No statistical differences between sexes were found. Measures of vaccine knowledge and acceptance among the Hadzabe lag behind the wider Tanzanian population, highlighting the need for greater communication about vaccines in a culturally appropriate manner. Such efforts are critical to protecting the health of an Indigenous, rural population undergoing increased market integration and greater biomedical access, to include a greater ability to vaccinate against disease, weighed against potential medical mistrust.

Feeding the institutional body: diet, discipline, and the specters of medical authority

During the Progressive Era, psychiatric treatment increasingly centered on somatic interventions for mental illness, including hydrotherapy and psychosurgery. However, beyond these direct medical interventions, patient diet emerged as a site of pathologization, surveillance, and therapeutic control. Institutionalized individuals were subjected to dietary regimens that reflected broader anxieties about health, morality, and social order, revealing the medicalization of food as both nourishment and discipline. This study examines archival records from psychiatric hospitals in Progressive Era California to explore how diet functioned as a form of medical intervention, reinforcing institutional authority and shaping patient identities. Using nonparametric statistics, we assess dietary restrictions among institutionalized patients in Northern California between 1900 and 1950, testing for differences across gender, age, diagnosis, and perceived severity of illness. These patterns reveal how the ghosts of mental-health pseudoscience continue to haunt contemporary understandings of food, health, and institutional power. Furthermore, by drawing on Foucauldian theory, we analyze the biocultural implications of diet within these controlled environments, tracing how food was weaponized in the regulation of bodies and minds.

Deconstructing the Westernized Past: Bioarchaeology's Need for Non-Biomedical models in Healthcare

Bioarchaeological explorations of disease and healthcare have highlighted the dynamic connections between human behavior and health outcomes to reveal complex ways past peoples navigated illness, care, and survival. Standard practice for diagnosing disease from skeletal remains is rooted in Western medical traditions (biomedicine). While this approach has yielded valuable insights, it imposes a framework that often overlooks the cultural, ritual, spiritual, and mental dimensions of healthcare prior to the 20th century. Emerging bioarchaeological theories

challenge these limitations, prompting us to ask if we can – or should – integrate non-Western understandings of health and healing into our interpretations. While these new theories allow flexibility for non-biomedical frameworks, the underlying Western biomedical paradigms constrain scholars from fully exploring past healthcare outside of the biomedical model. As such, this is the perfect time to reflect on our Western foundations and galvanize the field around a more culturally inclusive, global bioarchaeology of health and healing. This presentation argues that integrating a four-fields approach strengthens bioarchaeology's ability to interpret past healthcare beyond a biomedical paradigm. By moving past the constraints of biomedicine, we can better reflect the holistic and culturally embedded practices surrounding health, healing, and care to challenge Western narratives of life in the past.

Presenter(s): Alecia Schrenk

Framing the Pandemic: A Data-Driven Linguistic Anthropological Analysis of Health Communication in Wuhan, China during the early days of COVID-19

The early months of the COVID-19 pandemic (December 2019–March 2020) in Wuhan, China presented critical challenges for health communication, public trust, and social stability. This study integrates linguistic anthropology and discourse analysis to explore how shifts in government messaging influenced public attitudes and behaviors during this pivotal period. Analyzing government press conferences, state media, and social media discussions, this research examines key terms like "战疫" ("war on the pandemic"), "英雄" ("hero"), and "谣言" ("rumor"). Findings suggest that as official rhetoric evolved from crisis management to a nationalistic "heroic resistance" narrative, public discourse shifted from skepticism to increased compliance, emotional resilience, and proactive health behaviors such as mask-wearing and voluntary isolation. By combining qualitative and computational methods, this study highlights the power of language in shaping public health responses. It underscores how historical and cultural contexts influence crisis communication, revealing the ghosts of past governance strategies that haunt present-day health outcomes. Ultimately, this research contributes to broader discussions on trust, systemic inequities, and the role of healthcare narratives in building a more equitable future.

2435 Lenticular Perspectives of Diaspora and Empire

Start Date: 11/21/2025 10:15 AM **through** 11/21/2025 11:45 AM

Venue: Marriott **Room:** MGB - Salon C

Type: Roundtable/Town Hall

In recent years, Western politicians, think tanks, and NGOs have re-channeled their efforts into "saving" Middle Eastern Christians, as violence against minoritized communities continues to rise in the wake of the American invasion and occupation of Iraq, the Arab Spring, the war in Syria, the emergence of ISIS/Daesh, and ongoing conflicts over territorial sovereignty and self-determination

throughout the region. To the extent that Middle Eastern Christians have registered in Western political imaginaries at all, they are either invoked to justify military intervention, or as an exemption to anti-Muslim immigration policies, because of their putative kinship as Christians with the West. Moreover, in the Middle East, Christians have also been instrumentalized by authoritarian rulers and the state in the service of national unity politics. All the while, local inter-communal tensions and incidents of violence are either utilized or eschewed by those in power, further marginalizing such communities from political action and collective flourishing. In this context, permanent migration to Western countries and the rapid growth of diasporic communities have become an integral feature of transnational Middle Eastern Christian social, political, and religious life. Diaspora expansion has had devastating impacts on Muslim-Christian relations in the Middle East, as their instrumentalization grows by right-wing, conservative actors abroad. Yet, these minority migrant communities also face forms of racialization, exclusion, and securitization in the West that either glorifies their ancient and martyrical sacrifice or effaces the vitality of their distinctive forms of life. This complex paradox lies at the center of two recent books: *Sonic Icons: Relation, Recognition, and Revival in a Syriac World* (Fordham University Press) by Sarah Bakker Kellogg and *Martyrs and Migrants: Coptic Christians and the Persecution Politics of US Empire* (NYU Press) by Candace Lukasik. Both books are the first of their kind, utilizing multi-sited, ethnographic methods, historical anthropology, and conceptual work on the intersection of race and religion to think about pluralism and minority politics in and beyond the Middle East. This roundtable gathers together interdisciplinary scholars of migration, religion, race, and kinship to think through the shared political, social, and theological dynamics and stakes of these two texts, bringing to the foreground how such communities exemplify the transnational workings of empire through migration and exclusionary regimes of recognition.

5514 Coastal Land and Beach Politics: Contested Histories, Uncertain Futures, and Critical Ethnographies

Start Date: 11/21/2025 10:15 AM **through** 11/21/2025 11:45 AM

Venue: Marriott **Room:** MGB Salon D

Type: Oral Presentation Session

This session examines the political, economic, social, and ecological stakes of coastal land as a historical space, shaped by competing imaginaries and claims. Across diverse coastal geographies, presenters explore the dynamics by which land and water along coasts and beaches are produced, structured, historicized, and contested over multiple scales, creating new material and symbolic realities that refract through histories of racial capitalism and environmental intervention.

As climate change accelerates sea level rise and intensifies storms, it exposes the fragility of shorelines and amplifies existing inequities, making critical, place-based ethnographic inquiry all the more urgent. What new political possibilities or constraints emerge in response to the emergency of climate change? What forms of resistance arise when public lands and beaches are closed off and made inaccessible? What new rationales, planning instruments, and discursive legitimation strategies are employed to hide the real economic and political stakes at play? By addressing these questions, this session aims to illuminate the forces shaping coastal land, its histories, and the futures imagined for it.

Presentation(s): Ethnohistories of Struggle Against the Privatization of the Beach

Black feminist scholar bell hooks (1952-2021) gave us innumerable conceptual tools to understand the complexities of race, gender, and place. Her critical essay "Homeplace: A Site of Resistance," first published in the 1990 *Yearning: Race, Gender, and Cultural politics*, illustrates how the homeplace can represent spaces of oppression as well as liberation. In this paper, I narrate stories from coastal cities across the Americas to explore the neighborhoods where the cultural imagination and radical politics flourish even as the poor and people of color experience the brutality of white supremacist violence and spatial displacement. In hooks' formulation, the oppressed make home in inhospitable places, resist the gendered racial domination of space, and demand a sense of cultural and political belonging. I tell the stories of how social movement activists fight to keep beach lands as Black home spaces, where they have forged communities and survived amidst the violence for generations. I focus on localized struggles against the privatization of beach lands in Jamaica, Brazil, and the United States. Based on comparative ethnohistorical research, I examine Black communities' historical relationship to coastal lands, the emergence of women's political agency in fighting forced displacement, and demands for public access that recognizes expansive notions of culture, rights, and leisure.

La Playas son del Pueblo: The Struggle for Puerto Rico's Coast

Puerto Rico's beaches are an ongoing focus of a multi-pronged fight for popular sovereignty and a sustainable future. On an island nation ringed by 800 miles of shore, community and environmental struggles over coastal resources in Puerto Rico are intensifying. The struggle over coastal resources, development, and access to the shore reveals the intersection of Puerto Rican history,

culture and political economy. The paper describes the historical understanding of Puerto Rico's coast and coastal resources which animates current clashes. A developmentalist approach post WWII, which envisioned the beach as a site of leisure, particularly for a foreign elite, stimulated the earliest protests against privatization of the beach in the 1960s. Then the paper highlights several ongoing battles over the beach that point to this arena as an ongoing site for competing views over Puerto Rico's sovereignty and future.

Presenter(s): Katherine McCaffrey

Haunting the High Ground: Structuring Climate Mitigation in a Coastal American Metropolis

This paper presents research on factors structuring the social order and access to housing in Norfolk, Virginia, a coastal American metropolis bisected and surrounded by waterways that are increasingly vulnerable to sea level rise and climate related flooding. We combine historical ethnography in archives of 20th-century city planners and housing activists with a database of contemporary housing permits filed in the city in the last five years for residential building projects associated with Norfolk's changing climate. We highlight the idea of hydrostatic pressure, ask how mitigation projects attempt to address it, and watch it develop as a discursive companion of climate change. Looking at these very different sources, we ask: who in Norfolk is mitigating risks to housing and where? Who can protect equity in houses? And, ultimately, how is the idea of climate change, lived in part as the experience of sea level rise, affecting ideas about housing, property values, and investment in mitigation?

Presenter(s): Landon Yarrington

Co-author(s): Jonna Yarrington

Cultural Repertoires and a Beach Dispute in Southern California

This paper explores some of the socio-political actions and coalitions that shrinking shorelines, beach erosion, and collapsing bluffs have been created for a beach town in Southern California. It builds on a local mediatic dispute over access to the beach and over rail tracks in the city of Del Mar to engage the beach as a political and politicized terrain where multiple constituencies with seemingly disparate interests come together. The Del Mar beach dispute is a case study in a preliminary effort to develop analytical tools to make sense of broader refusals to state infrastructural projects that might encroach the use of public space in the age of climate change. It proposes the concept of cultural repertoires, or the supply of skills, and devices, used by different social actors to enunciate and communicate competing views and demands on the beach as a physical, symbolic and affective social space. It discusses three different yet related cultural repertoires at play in Del Mar fencing dispute: (a) repertoires of cultural fixation, intended to secure the hegemonic white, enclosed, tourist beach of the status quo; (b) scientific repertoires, that monitor and predict cliff activity according to Western-centric tools such as metrics and projections aimed at climate mitigation; and (c) fugitive repertoires, that emerge broadly in Indigenous-led relational enunciations of water-stewardship.

Presenter(s): Matilde Cordoba Azcarate

A Gulf Divides Us - "America" Along Mississippi's Beachfront

On the first day of Donald Trump's second presidential term, he signed Executive Order 14172 "Restoring Names That Honor American Greatness" and designating, for the first time, the Gulf of Mexico as the "Gulf of America" in the parlance of the U.S. Federal Executive Branch. This revision would soon be taken up by other federal agencies, as well as corporations and NGOs. For many residents in Mississippi's Gulf-adjacent Harrison County, of whom 64 percent of active voters supported Trump in 2024, the move did not sit well. This paper will draw on critical ethnographic fieldwork along Harrison County's beaches to explore ways that residents' sense of place inflect with MAGAism's performative politics of the moment. While the Gulf's suggested renaming in some instances deepens existing political fissures, it also creates a space for new connections as diverse coastal residents attempt to preserve their homes. Myriad environmental, social, and economic crises carry on apace, each facing challenges for consensus about their nature—and very existence. As residents speak up to protect this place in large and small ways, what openings are created to negotiate these broader concerns?

Presenter(s): Theo Hilton

Troubling Tourism & Coastal Conservation of the Sea Islands

Island space as a precarious, ever changing, and fluid geographic formation remains an essential analytic from which to think through McKittrick's notion of Black livingness. The Sea Islands of coastal Georgia occupy multiple roles – living laboratories, pristine beach destinations for tourists, conservation land, and sites of deeply embedded Black ecologies. This condition is particularly poignant on the coastline where compounding issues of sea level rise, conservation priorities, and coastal gentrification generate a paradox – the white spatial imagination imagines futurity, but only amongst white lives. To be Black in the diaspora is to have deep spiritual and emotional connection to specific land and waters, while not being fully recognized as indigenous to space. This paper will focus on the context of the US Sea Islands where intersecting conditions of racial capitalism and climate change threaten the future recognition of Black communities as connected to place. It will discuss the implications of prioritizing conservation and tourist imaginaries of the post-plantation Georgia waterscape and the notions of Black livingness that emerge in the interstice.

Presenter(s): Adrian Cato

1056 When The Dead Aren't Ghosts: The Ethical-Political Dimensions of Communicating with Spirits

Start Date: 11/21/2025 10:15 AM **through** 11/21/2025 11:45 AM

Venue: Marriott **Room:** MGB Salon E

Type: Executive Roundtable/Townhall

The dead cannot be reduced to haunting; they are often animated and mobilized in future-oriented projects that aim at new life not by reproducing the past but by radically transforming it. These projects are often carried out in ritual interactions through which death and life are configured within and against each other. Just as people draw upon figures of the dead and revoice their sentiments to make political claims and evaluate their ethical entailments, so, in interacting with figures of the dead, do the living find themselves pressed to revoice concerns and explore political directions with surprising ethical dimensions. These directions and dimensions may turn out to offer novel perspectives and tools for investigating inequitable and exclusionary systems and processes-or, in some cases, may create inequities and exclusions of their own. In this session, participants consider the communicative and ethical demands that the dead and the living put on one another: how they talk to each other, what they demand of each other, and what happens when either dead or living fail to carry out the responsibilities expected by the other side. Conversations between living and dead are found in a diverse constellation of cross-cultural contexts, and participants in this roundtable aim to generate new scholarly discussion and analysis focused on enduring questions about how death reconfigures sociality: What communicative practices stimulate the political dimensions of mourning and remembrance? What role do traces and remains play in animating and agitating relations with the dead-and, conversely, what material forms do conversations between dead and living call new attention to? What happens when the dead are insistent in their demands or require ethical reorientations from the living that the living may be hesitant to accept? What temporalities do communications with and from the dead produce, how are physical and metaphysical worlds articulated across time, and what futures do these necro-chronotopes presage?

Session members include anthropologists with expertise on African diasporic spiritual and aesthetic practices that counter the necropolitics of misogyny and anti-Blackness; AI companions that serve to replicate deceased humans but are also said to die themselves when their companies go bankrupt; Spiritualist mediums who articulate visions of the astral plane as the site of our most intimate companions who, in death, mark their new existential distance in speaking distinctly and losing sense of time; secular humanists who work to articulate death's significance for living and dead alike without recourse to the sacred; and how people in Cambodia cope with life's difficulties, including but not limited to the effects of war and violence, by using music and sound to maintain relations of mutual care with the dead. Together in conversation, all participants explore emergent ethical-political dimensions of spirit communication.

3708 Queer emergent: Thinking with Justin Perez on queer worlds in transformation, ethnographic collaboration, and the ending of AIDS in Peru

Start Date: 11/21/2025 10:15 AM **through** 11/21/2025 11:45 AM

Venue: Marriott **Room:** Regent

Type: Roundtable/Town Hall

Justin Perez's *Queer Emergent: Scandalous Stories from the Twilight of AIDS in Peru* (Duke University Press, 2025) explores the transformations and contradictions gay and transgender communities in urban Amazonian Peru experience as the ambition to "end AIDS" unfurls across their lives. Amid entrenched forms of racism, pervasive homo- and transphobia, and everyday violences, Perez examines how gay and transgender communities respond to and subvert the impasses and predicaments brought about by shifting global priorities and new forms of HIV prevention. Through their transgressive, embellished, and "scandalous" stories, gay and transgender communities challenge both the underlying moral assumptions of "end of AIDS" triumphalism as well as imagine and inhabit emergent social worlds. This roundtable brings together experts in medical anthropology, queer anthropology, and the anthropology of Peru to discuss the conceptual contributions and ethnographic possibilities posed by *Queer Emergent*. Likewise, as we observe a changing socio-political landscape today marked by a withdrawal of support for community-based organizations that support marginalized and stigmatized groups like LGBTQ communities, and intensifying transphobia, we consider how *Queer Emergent* poses meaningful tools for analyzing the forces threatening to erode the meaningful progress made at mitigating vulnerabilities to HIV/AIDS and imagining space for queer social worlds to thrive.

2434 Anthropology of White Supremacy Book Roundtable

Start Date: 11/21/2025 10:15 AM **through** 11/21/2025 11:45 AM

Venue: Marriott **Room:** Studio 10

Type: Roundtable/Town Hall

White supremacy is not a ghost of the past—it is alive, moving through our institutions, shaping our economies, policing our borders, and dictating who lives and who dies. It is not just lingering; it is living. A number of contributors from the recently published book, *The Anthropology of White Supremacy* (Princeton University Press, 2024), gather in this roundtable to confront how white

supremacy continues to structure global politics, everyday life, and the very discipline of anthropology itself.

Our focus on anthropology of white supremacy began with a panel in 2016 and has since evolved into both a special issue of *American Anthropologist* and this recent volume. At the time, some critics dismissed the use of "white supremacy" as an outdated or anachronistic analytical framework. Nearly a decade later, however, few would deny that what we are witnessing in the United States is the culmination of a white supremacist mode of governance—one that operates through fascist and authoritarian means to revive a vision of white-settler empire that was never fully dismantled.

Drawing from research in Brazil, Iceland, Japan, Mexico, Nigeria, Palestine, Senegal, South Africa, and the United States, panelists reveal how white supremacy operates through finance, advertising, militarism, policing, migration, and development—not as a spectral remnant but as a present, on-going, embodied and systemic force. We ask: How do we reckon with white supremacy's continued animation? How does anthropology's own history make it complicit in sustaining this force? And what will it take, before it is too late, to bring another world into being?

Engaging the AAA's theme of Ghosts, this roundtable insists that the ghosts of white supremacy are not dead. They breathe through our institutions, speak through our media, and dictate our futures. To understand them is not enough; we must decide whether anthropology will continue to host them—or finally become a site of transformation and liberation.

8883 "Monsters, Devils, and Survival: The Persistence of Plantations and People in

the Scholarship of Pujo Semedi"

Start Date: 11/21/2025 10:15 AM **through** 11/21/2025 11:45 AM

Venue: Marriott **Room:** Studio 3

Type: Late-Breaking Roundtable/Town Hall

This roundtable brings together American scholars influenced by the impact and influence of Professor Pujo Semedi's scholarship on capitalist extraction and colonial afterlives. Pujo Semedi is

Professor of Anthropology at Universitas Gadjah Mada in Yogyakarta, Indonesia, and Fulbright Scholar-in-Residence at the University of Colorado Boulder during Fall 2025. His work interrogates the curious contemporary formations of plantation cultivation, a form of extraction designed under colonial conditions which has outlived that era. His individual and collaborative ethnographic research broadly analyzes the monstrosity of extraction and the sociality of survival over long historical periods and varied geographic settings. From oil palm plantations in Kalimantan and tea plantations in Java to vineyards in Germany, he broadly asks how forms of extraction which were designed to maximize accumulation at the cost of human sociality may in fact produce the inverse: financial loss and human survival. At the crux of these questions are the entangled fates of the human and the more-than-human. In addition to the timely nature of his analyses, his research also suits the annual theme and location of this year's annual meeting remarkably well. His research on the monstrous haunting that the plantation form generates, around the world, will dovetail well with the plantation legacies of the greater New Orleans area.

As a Fulbright Scholar-in-Residence at the University of Colorado, Professor Semedi is working closely with faculty and graduate students, generously sharing his scholarship with US scholars whose research on extraction and imperial formations benefit from his global and post-colonial expertise. Professor Semedi's expertise is urgently valuable in the current moment when political and economic imaginaries face crises of authority, legitimacy, and belonging. Professor Semedi's Fulbright status was approved in Fall 2024 but was stalled for several months in early 2025 while US foreign policy budgets were frozen. We received final approval for his fellowship two days after the April annual meeting submission deadline, thereby obliging us to fulfill our initial promise to Fulbright to host a session in his honor via the late-breaking submission process. Although Professor Semedi collaborates widely with scholars in Asia, Europe, and North America, this is his first visit and introduction to the US.

All proposed panelists are enthusiastic about engaging his work and his impact. The roundtable includes Professor Semedi as respondent, Jerry Jacka as chair, and six presenters, Carla Jones, and five advanced doctoral students in Anthropology at the University of Colorado: Kathleen Donlan, Yuxiang Lin, Jessica Misiorek, Chilton Tippin, and Sanggay Tashi.

Organizer: Carla Jones , Jerry Jacka, University of Colorado, Boulder, Department of Anthropology

3779 The Social Properties of Concrete

Start Date: 11/21/2025 10:15 AM **through** 11/21/2025 11:45 AM

Venue: Marriott **Room:** Studio 4

Type: Roundtable/Town Hall

Concrete is the most ubiquitous human-made building material in the world. What might be

learned about social life from thinking through the manifold ways that concrete is brought to bear on the world? What might be learned about concrete by understanding how social, political, and economic practices embed themselves in particular ways within the material? The recently published volume, *The Social Life of Concrete* (punctum books, 2025) considers these questions by developing conceptual insights from a range of globally situated case studies. Across its 40 chapters, the authors in the volume reveal concrete's local impacts, its global history, and its planetary reach. Read together, the book develops new insights into the materiality of infrastructures, modernization, democracy, settler colonialism, militarism, ecological transformation, and more. In this roundtable, the authors and editors of the book come together to explore the insights their work has developed and the questions the book has produced. We will debate our conceptual findings, explore their limits, and speculate about the material's future(s).

2709 Being "at Home": Constructing Belonging in Settled Worlds

Start Date: 11/21/2025 10:15 AM **through** 11/21/2025 11:45 AM

Venue: Marriott **Room:** Studio 6

Type: Oral Presentation Session

Anthropological approaches have proven especially fruitful for understanding the ways in which home denotes more than a geographic site or physical structure. Home takes material and imaginative forms that are inhabited across multiple temporalities, or felt through daily routines and ties to family, culture, and community. Home appears as a locus of human kinship and multi-species relations, a microcosm of gendered labor divisions, and a form of affective or sensory experience. This panel moves toward more capacious definitions of "homemaking" and "placemaking" by exploring different processes of constructing and asserting a sense of belonging. It draws from our ongoing research in Africatown, Alabama; Cooperation Jackson in Mississippi; seabird nesting grounds on Kaua'i; the sertão of northeastern Brazil; and urban farmland in Seattle. We bring into conversation this range of sites to ask how communities inscribe themselves and their stories into particular landscapes, histories, and social worlds.

Placing focus on contexts of settler colonialism, racial inequality and exclusion, and structural violence, we consider how these conditions give rise to disparate—and often competing—spatial claims and constructions of home. As Ananya Roy (2017) describes, home takes form through practices of emplacement, or acts of occupation, habitation, and domesticity with the potential to challenge exploitative systems of property and precarious tenancy. In reflecting upon the broader political and ecological terrains that shape lived experiences of home, we look to Black and Indigenous communities' land reclamation, labor movements, environmental governance, cultural

resurgence, and heritage work to help us understand home as an expression of rootedness, relatedness, and resistance. How might these projects affirm belonging in ways that disrupt present structures of dispossession and disenfranchisement?

Presentation(s): Inherited Belonging: Cultural Heritage and Placemaking Counternarratives

Africatown, Alabama— a community founded by the captives of the last slave ship to reach US shores— is externally defined by its historical significance and cultural heritage. Tourists, documentarians, history buffs, and anthropologists alike flock to the community in hopes of meeting a descendant of those 110 captives, someone they might recognize from a Netflix or National Geographic documentary. These outsiders, myself included, arrive(d) in Africatown in search of some sort of 'Africanness' , an assumed heritage and identity ascribed historically and described by the likes of Zora Neale Hurston. Yet conversations with descendants and generational residents of Africatown reveal a much different story. One in which belonging hinges on things far removed from the confines of a ship hold, and memory focuses on traumas and triumphs far removed from slavery and emancipation. As an archaeologist, I approached the community in search of these traces of West African identity construction in the fabric of Africatown's modern identity, but as a Black feminist practitioner I was moved to adjust my research focus to better understand those things that arose through oral history and ethnographic observation, as most central to Africatown's identity construction both past and present. The inheritance of belonging, cultivated by a people cast off.

Presenter(s): Madison Aubey

Presentation(s): Seizing Home: Localizing MST and "Productivity" in the Brazilian Sertão

Over the past 40 years, Brazil's Landless Workers' Movement (Movimento dos Trabalhadores Rurais Sem Terra, or MST) has become one of the world's largest land reform movements. Yet even as MST organizes land seizures involving hundreds of thousands of people, its nationwide project grows from countless small-scale agricultural encampments operating in highly local contexts. Specific encampments' local contexts encourage different understandings of "productivity," which is also a federal requirement for legalizing land seizures. I therefore examine MST encampments in northeastern Brazil's arid sertão: an ecologically distinct, rapidly desertifying, and perennially rebellious "backland" region that demands localized research. How do MST encampment residents in the sertão negotiate different conceptions of productivity—as understood through federal requirements, subsistence needs, and sociohistorical practices—while they attempt to legalize land

seizures? I examine the physical remains of these approaches to productivity, focusing on archaeobotanical traces from farming and the materiality of encampment homes. This research not only studies the material changes necessary in creating "successful" productivities for MST encampments, but also aims to better understand local ideas and practices of land productivity amongst those individuals who choose to seize land.

Presenter(s): Gabriel Silva Collins

“For Birds, Not You”: Multispecies Placemaking and Resistance to Settler Colonial Dispossession

The north shore of Kauaʻi is home to many of Hawaiʻi's endemic seabirds, including endangered or threatened species like the ʻaʻo (Newell's shearwater) and ʻuaʻu (Hawaiian petrel). With rising sea levels and other impacts of climate change jeopardizing major seabird colonies in the northwestern Hawaiian islands, the higher elevation cliffs along the north shore provide increasingly critical nesting grounds for species like the mōlī (Laysan albatross). Yet escalating rural gentrification in this region further threatens its seabird populations, as the construction of multi-million dollar oceanfront mansions continues to transform unique coastal ecosystems.

In this current wave of US settler colonial incursion, luxury real estate development encroaches upon vital seabird habitat while at the same time displacing Kānaka Maoli (Native Hawaiians) from their homes and communities. For many, remaining in the locale means navigating skyrocketing living costs and ever-eroding access to land, water, and resources. If the ongoing process of colonization induces experiences of dispossession among human and nonhuman residents alike, how might resistance, too, prove to be a multi-species affair? My ethnographic research at this site examines how encounters with seabirds figure into the notion of home as people mobilize to defend nesting grounds. In turn, I explore how interspecies relationships frame the struggle over who gets to call a place home.

Presenter(s): Amber Chong

The Soil is a Portal: Urban Agriculture as Insurgent Reclamation of Space and Power in Seattle

Across time and space, Black and Indigenous land relations encode intertwining narratives of ancestral memory, homemaking, and resistance to oppression. This project—woven through poetry, photographs, and collage—engages Black Feminist ecologies and Afrofuturist storytelling to trace how urban farmers in Seattle are tending to the soil as insurgent acts of placemaking and mutual aid. Here, farming is alchemy and a pathway towards rematriation; stewardship being a way to confront and disarm the enduring forces of settler-colonial displacement and erasure in the city. This work maps the mycelial networks created by local farmers and food sovereignty advocates, where the logics of land-and-water-as-capital are rejected. Within these spaces, people are creating new choreographies of care in response to state-sanctioned neglect of marginalized communities. The soil is indeed a portal; gateways to alternate "Seattles" where needs are met and surpassed. In these alternate universes land and waterways are stewarded collectively and the engine of capital accumulation made defunct. Through this project I seek to better understand how

urban farming in Seattle is simultaneously an act of ecological and communal repair and a proclamation of Black and Indigenous refusal to disappear.

Presenter(s): Yveline Saint Louis

Black and Native Feminisms toward Liberated Placemaking

Black and Native feminist literature, scholarship and activism attend to the ways communities manage structurally distinct formations based on their cosmologies and ontologies. Harris (1993) and Goeman (2009) explore how the concept of property connects race, gender, and land/space as similarly conceived objects of dis/possession. Black women, Black matriarchs and Black communities, in their agentic imaginations and performances of life beyond the limits of the white ideal, exemplify possibilities of sociality beyond the perversity of anti-Blackness. For Gilmore (2022), the normative concept of family remains contentious for Black freedom dreams; she instead locates potential in mutuality for "nonfatal power-difference couplings" (136). King (2018) finds cause for hope and radical, revolutionary Black relationality conceived beyond the narrow structure of Western family. In addition to feminist and ethno-sciences, Black and Indigenous spiritual formations bear transformative consequences on community formation. Black and Native feminisms prove science and knowledge, like space and time, are mutable; they can be employed toward injustice as well as toward our collective liberations. Here, I discuss the unboundedness and alterability of these feminisms. They show us that expanded realms of liberation will be gained in the present and future as they have been in the past: through communal interdependence.

1990 When the Past Collides with the Present: Historical Legacies, Cultural-Ecological Landscapes and the Spirit(s) of Resistance

Start Date: 11/21/2025 10:15 AM **through** 11/21/2025 11:45 AM

Venue: Marriott **Room:** Studio 7

Type: Oral Presentation Session

When the past collides with the present, the immaterial shapes landscapes in tangible ways, and influences future aspirations. Colonialism, state formation, climate change, top-down development, land grabs, and deterritorialization and reterritorialization can impact livelihoods, coping strategies, rights, and ecological conditions, as well as future lives and incarnations. This panel explores the ways in which cultural-spiritual beliefs, norms and practices intersect with colonial and historical legacies and struggles over resources to become inscribed onto the landscape. Responses and expressions of power and knowledge concerning land and livelihood-making thus play out in the daily practices of human communities on registers both mundane and beyond the human. Papers in this panel explore the way the past haunts the present – how the ancestors, deities, spirits, and historical figures, legacies and policies in and across temporal and spatial contexts manifest in cultural practices, geographies, and relationalities. The panel

investigates, at the interface of development and indigenous knowledge, various modes of meaning-making, cultural-spiritual articulations, ontological frictions, contestations over and resistance to discourses, and representation. The spirit(s) of resistance take different forms, from the verbal to the non-verbal, the tangible to the intangible, from the human to the more than human, and the living to the non-living. Ethnographies from and across the Himalayas and Sub-Saharan Africa allow for the opening of theoretical space, dialogue, comparative cross-cultural analysis and reflections on assemblages of power and knowledge that go beyond borders (i.e. actors, institutions, forces, discourses, etc.), but that shape local cultural-ecological landscapes, as well as anthropological engagement. The spirit(s) of resistance becomes integral to understanding and representing the voices and perspectives of interlocutors in our ethnographic analysis, but also of the anthropologist in articulating responses, activism and forms of expression in relation to them – from pen to paper, thought to action, and academia to activism. Reflexivity opens space for contemplation of the struggles and dilemmas of the anthropologist as an intellectual, academic and practitioner in responding to events and crises, such as shifting political and economic landscapes, climate crises, and threats to freedom of expression and academia. Such issues are not only relevant during field work, writing and analysis, but have become urgent in recent months in representing the lives and struggles of differently positioned interlocutors in turbulent times and fractured spaces.

Presentation(s): Remaking Spiritual Landscapes: Resettlement and Religious Expression among Tibetans in Northwestern China

Rural development, urbanization, and state environmental policies have changed the lives of Tibetan farmers and pastoralists in China in myriad ways. This paper examines how those changes have affected placemaking through spiritual engagements in both new and ancestral sacred spaces. Case studies examine efforts to create new religious institutions and practices in resettlement towns and sustain connections to important sites on ancestral lands. The first part of the paper describes spiritual practices being worked out in a farming community whose homes and monasteries were demolished during government-led programs of mechanized agriculture and reforestation in the name of environmental conservation. Against the backdrop of state interventions that have altered community-deity-land relationships, villagers have refashioned spiritual expression through new village temples and elaborate private shrine rooms in their rural

homes and urban high-rise apartments. The second part of the paper focuses on pastoralists who have abandoned a mobile herding lifestyle for town resettlement and modern occupations. This change also marked an end to the traditional mobile tent monasteries that had traveled to meet the needs of the laity—now replaced by imposing monastic buildings and temples in resettlement towns. Town dwellers also have adopted a new cosmopolitan aesthetic for home shrines, while maintaining ties to old territories and their unique spiritual landscapes.

Normalizing the “Global Land Grab”: Theoretical Insights from the Politics of Knowledge and Ontology

In this talk, I draw on the politics of knowledge to explore the trajectory following the civil society outcry in 2008-09 over the "global land grab" to the consolidation of a set of international norms governing land rights by the mid-2010s. This transition was hailed as a great achievement in forging a consensus on the need to respect customary land rights, and indeed some good may have come from it. Yet I argue that this transition has also (1) shifted blame for tenure insecurity in significant ways, thereby deflecting attention from root causes, while (2) advancing and institutionalizing tenure constructs that are compatible with ongoing land loss and work to wipe other securities, relationalities and worlds off the map. I explore these dynamics globally with a focus on Africa, using discursive vignettes to locate (i) the dynamics relevant to each of three theoretical lenses (power/knowledge, ontological anthropology, coloniality) within dominant discourses; and (ii) the worlds brought into being by each set of practices. To heed Eve Tuck's call to "suspend damage" (Tuck 2009), I also locate other world-making projects and possibilities from both the pluriverse and spaces of epistemic privilege.

With post-truth politics ratcheting up to a fever pitch, there is need for concerted action to counter dominant discourses and their effects across fields of vision and practice. I conclude by drawing on my own methodological praxis as an initial scaffolding for such an endeavor.

Presenter(s): Laura German

The Spirit(s) of Resistance and Development Incarnations in Remote Cultural-Ecological Highland Landscapes

In remote pastoralist landscapes of northwest Bhutan, the past collides with the present in the realm of deities, spirits and reincarnations of past lives. From the benevolent to the ominous, their omnipresence manifests both ecologically protective and destructive powers requiring appeasement and supplication through rituals. However, other contesting forces are at play, and a complex, layered history of actors and forces resonates in the present. Powerful deities, spirits, historical figures, legacies, policies, reincarnations and cumulative karma shapes the local environment, and human inter-relations. Historical entanglements collide with contemporary forces – from the effects of state formation and crypto-colonialism, to development interventions

directed from the lowlands and international organizations, climate emissions generated from the Global North, and global capitalistic discourses of sedentarization and secularity. The paper investigates, at the interface of critical political-ecology and spiritual-ecology framings, modes of indigenous meaning-making, more-than-human articulations, ontological frictions, and resistance to dominant narratives, policies and representation. Reflexivity, subjectivity, fluctuating embodiment of vulnerability of the anthropologist and interlocutor, and comparative conclusions from fieldwork in Madagascar, elucidate ethnographic dilemmas of research and writing critical ethnography in contexts of academic control and narrative closure.

Presenter(s): Ritu Verma

Spirits of the Land: Cosmopolitical Resistance in Bhutan's More-Than-Human Landscapes

In the Eastern Himalayas, Vajrayāna Buddhism and Indigenous 'Bon' traditions are relationally interwoven within spiritual-ecological landscapes shaped by complex cosmopolitical ontologies. Territorial deities- yul lha (ཡུལ་ལྷ་); gzhi bdag (གཞི་བདག་); gnas bdag gzhi bdag (གནས་བདག་གཞི་བདག་)- wield tenurial power in trees, forests, cliffs, mountains, lakes, and springs, and their palaces (pho brang) are sites of enforced relational governance and moral geographies. We inquire how past and present collide in Bhutan's more-than-human landscapes, and how territorial deities resist and are sporadically subsumed by homogenizing logics of capitalist development and non-western conservation paradigms that can inadvertently overwrite local ontologies. Our effort foregrounds the spirit(s) of resistance not only via political or material agents, but also as cosmological- manifest in ritual practice, visionary cartographies, and spatial ontologies. Drawing on participatory mapping, oral histories, and iconographic traditions such as thang kha and ldebs ris, our research illuminates how communities articulate counter-geographies and reclaim ontological space for localized knowledge and non-human kin. Such cosmopolitical engagements offer critical reflections on conservation governance and anthropological responsibility, calling for reflexive scholarship attuned to the voices, worlds, and cosmologies that persist and resist at its highest peaks.

5356 New Books Roundtable: Sex Work, Law, and Rights in India

Start Date: 11/21/2025 10:15 AM **through** 11/21/2025 11:45 AM

Venue: Marriott **Room:** Studio 8

Type: Roundtable/Town Hall

This roundtable will bring into conversation two new books that examine the contested meanings and politics of sex work—as governed by law and NGOs, and redefined by rights movements—in contemporary India. Both Simanti Dasgupta's *Prophylactic Rights: Sex Work, HIV/AIDS, and Anti-Trafficking in India* (Cambridge University Press, 2024) and Vibhuti Ramachandran's *Immoral Traffic: An Ethnography of Law, NGOs, and the Governance of Prostitution in India* (Cambridge University Press, 2025) are ethnographies examining the laws, politics, and modes of intervention shaping the governance of sex work in India, and how sex workers navigate this terrain. The relationship

between sex workers and Indian state agencies, the role of a range of interventions from public health to anti-trafficking in shaping this contested field, and the new subjects that emerge within it resonate across both books. Despite these substantial overlaps, there are also significant departures in the methods, sites, interlocutors, and conceptual frameworks and contributions of both authors. For instance, Ramachandran's book is situated at the complex intersection of India's anti-prostitution law and global anti-trafficking campaigns, and how they impact both trafficked and voluntary sex workers in New Delhi and Mumbai. On the other hand, Dasgupta's book is about the lived experiences and labor rights activism of the sex workers' movement in Sonagachi, Kolkata, at the complex intersections of law and medicine, surveillance and subversion.

The roundtable will place these two books in conversation to discuss their overlaps, departures, and contributions to the study of law, sex work, the postcolonial Indian state, NGOs, and global regimes of aid and advocacy. The conversation will also reflect, more broadly, upon the books' collective and distinct contributions to the fields of law and society, gender and sexuality studies. The two authors will also comment on each others' books. Each panelist will bring their unique academic background and training, disciplinary location, theoretical repertoire and methodological expertise to the conversation.

8339 (Un-)black-boxing AI Agencies: Ghostly and Ghosted Machines, Part 2

Start Date: 11/21/2025 10:15 AM **through** 11/21/2025 11:45 AM

Venue: Marriott **Room:** Studio 9

Type: Oral Presentation Session

The collection of technologies routinely thrown into the "AI" kitchen sink has become as ubiquitous as the value-laden narratives about them. While contemporary computational systems present genuinely new techno-scientific, machinic affordances, many of their supposed novelties are anything but—nor are the narratives, values, or interpretations assigned to them by individuals, groups, and institutionalized personae across both expert-technical and nonexpert domains. This panel explores how regimes of value, narratives, and implicit-to-explicit understandings of personhood and/or agency, reflexively framed as belonging to prior social spacetimes, continue to haunt AI in the present, not despite, but because of diverse narratives asserting its radical novelty (Choi and Babcock 2024). We ask: what enfolded, immaterialized, or absented agencies trail

behind or snake through AI? How do epistemic and systemic violences-racism, sexism, anti-Blackness, white supremacy, ableism, and other intersectionally compounding oppressive structures (Wilf 2023; Seaver 2022; Semel 2021; Benjamin 2019; Noble 2018)-linger, become ghosted from, and interpenetrate with the functioning and uses of, as well as narratives about, AI? And how does the functioning of AI get rendered inscrutable in some contexts-made "invisible by its own success" (Latour and Woolgar 1979)-while in others, it is opened wide to explanations with varying degrees of "truth," "facticity," or legitimization? This panel contributes to ethnographic explorations of AI by synergistically bringing together grounded-theoretical approaches to technological (un-)black-boxing from scholars across fields and (sub)subfields of anthropology (with a particular focus on linguistic and semiotic anthropology; Wortham and Reyes 2015), along with diverse (inter)disciplinary approaches to techno-scientific and material agencies, from STS and HCI to interactional sociology, sociolinguistics, the history of technology, and beyond.

Presenter(s): Edward Maclin, University of Memphis, Department of Anthropology, Hilary Dick, Arcadia University, Wee Yang Soh

Discussant: Angela Reyes, CUNY, Graduate Center, Department of Anthropology

Presentation(s): Possession and the Spirit of AI

In 2024, Memphis became the home to the world's largest Artificial Intelligence (AI) supercomputer, built by Elon Musk's xAI amidst ongoing local environmental controversies. Around the same time, the University of Memphis announced a new multidisciplinary minor titled "AI for All." As an anthropologist with interests in both environmental justice and critical pedagogy, I have followed these developments closely. This paper is an autoethnographic view of AI as something more than a simple tool. Within technocratic circles, AIs are often described as a value-neutral in essence, with any ethical challenges being a result of their use. In this paper I argue that AIs should be taken seriously as value-laden non-human actors. Building on Ivan Illich's (1973) ideas of tool logic and Miller's (2021) critique of the Value-Neutrality Thesis, I suggest that AIs act as beings of spirit: ghosts of predominantly Western, capitalist technologies with the capacity to possess people and organizations, leading to changes in thought and behavior. Looking at AIs from this perspective provides a way of naming and describing these entities within anthropological work, and raises questions about how we can protect ourselves from possession and what an exorcism of AI might involve.

Presenter(s): Edward Maclin

Calling Out the Spector: Black TikTok, Digital Fluidity and the Defiance of Algorithmic Whiteness

This paper explores Black fluidity on TikTok as a political refusal that disturbs white supremacy produced from the platform's algorithm. This form of artificial intelligence analyzes user behavior to

generate personalized For You pages (FYP). As such, it is a ghostly presence outlined through what does, and does not, appear on one's feed. We focus on content produced by Black TikTok, or Blacktok, users critically addressing acts of white possession that position Black people as property, concentrating on posts that call out TikTok's artificial intelligence (AI) itself. We unpack a central tension in TikTok's affordances. FYP require algorithmic uniformity, a process that makes feeds seem to organically align with a user's stances and desires. This process tends to center the cultural norms of whiteness, mirroring for Black users historical pressures to conform by "acting white." Yet, FYP also enable to creation of domains, such as Blacktok, in which users refute algorithmic whiteness. Thus, TikTok is a site of struggle between manufactured consensus and the emergence of radical resistance. Blacktok creators draw on the deep archive of Black revolutionary thought and action to counter the violent misrepresentation of Black humanity endemic to white supremacy with critical commentary that is also rooted in humor, play, and joy. Such Black fluidity not only defies algorithmic whiteness; it provides a window into the possibilities of political transformation.

Presenter(s): Hilary Dick

Human After All: AI, Idol Labor, and the Ghost Work of Virtual K-pop

As AI becomes a central imaginary in K-pop's future, virtual idols like SM Entertainment's Naevis and Pulse9's Eternity are promoted as post-human solutions to the risks of mortal, fallible stars. These figures claim to exceed human limits—yet their creation relies on remixing the faces and voices of past idols, layered onto human movements via motion capture. Fans are quick to notice this disjuncture: while "AI" is marketed as disembodied, flawless, and novel, its production is deeply rooted in invisible labor, aesthetic histories, and socio-technical patchwork. Drawing on ethnographic research in South Korea, this presentation explores how AI in K-pop is not just a technical shift but a technofuturist fantasy haunted by prior ideals of femininity, aspirational labor, and celebrity. I argue that the ghost work behind these virtual idols—modeling, choreography, affective engineering—reveals a fantasy of neoliberal self-actualization: a perfected being sculpted from collective human effort, yet forever unattainable by any single person. These idols invite us to question what "artificial" means when its very form is constituted by human traces, and how anxieties over authenticity, precarity, and idealized labor shape the aesthetics and moral claims of AI in pop culture.

2850 Histories Haunting Industrial Cultures

Start Date: 11/21/2025 10:15 AM **through** 11/21/2025 11:45 AM

Venue: Sheraton **Room:** Edgewood AB (4th fl)

Type: Oral Presentation Session

This panel explores the enchantment of industrial cultural production, examining how historical forces and spectral presences persist within spaces commonly framed as bastions of 'modern' and

'secular' rationality. Drawing on Walter Benjamin's (1935) insights into capitalism's dreamworlds and modern enchantment, contributors investigate how past relations of power, creative practice, and cultural knowledge haunt contemporary industrial cultures.

Through ethnographic studies across industries of archaeology, fishing, television, and fashion, papers examine how institutional structures and creative practices are shaped by histories and presences that their modernist self-presentation often disavows (Bear 2018; Bhattacharyya 2024; Klima 2019; Martin 2017; Parry 2015; Silvio 2019). While industries are positioned as forward-looking and innovation-driven (Irani 2019; Wilf 2019), our research reveals how colonial legacies, labor histories, and displaced cultural and religious traditions continue to manifest in present-day practices, aesthetics, and power relations.

Contributors explore various manifestations of these hauntings: indigenous creators navigating histories of appropriation while asserting contemporary agency; workers confronting the spectral presence of past labor regimes in current production systems; and institutions whose claimed rationality is undergirded by persistent mythologies and ritual practices. Together, these perspectives challenge simplified narratives of secular industrial modernity, revealing how enchantment and rationalization intertwine in contemporary cultural production.

Key questions include: How do historical patterns of extraction and appropriation continue to structure relationships between centers and margins of cultural production? In what ways do creators and workers mobilize historical knowledge to challenge dominant industrial narratives? How do past struggles materialize in contemporary working conditions and creative practices?

Drawing from fieldwork across multiple sites, papers examine how these spectral presences manifest in material practices, creative processes, and labor relations. In doing so, we contribute to broader and longer-standing anthropological discussions about materiality, temporality, power, and enchantment (e.g., Munn 1992; Myers 2002; Ong 2010; Scott 1998). By examining how the past haunts industrial cultural production, we gain new insight into the reproduction of power dynamics and emerging possibilities for transformation, expanding theoretical frameworks for analyzing cultural production in late capitalism.

Presentation(s): Enchanting Time: Archaeological Narratives and Past-Present Rivalries in India

In January 2025, M.K. Stalin, Chief Minister of the south Indian state of Tamilnadu, made a dramatic announcement befitting his cinema-industry lineage: the Iron Age, hitherto dated to the Fertile

Crescent, had its earliest beginnings "on Tamil soil." This temporal recalibration, crafted into a "news event" (Cody 2023), carries profound implications for contemporary Indian political discourse. Modern statist archaeology in India navigates between neoliberal rationalism and romantic patriotism, seeking to maintain scientific rigor while constructing narratives of an enchanted past. This tension is further complicated by India's current Hindu nationalist regime, which seeks to establish a direct correlation between territory and religion, such as in the Indus Valley Civilization (IVC)—South Asia's oldest known state-level society— which needs to be Hindu, Sanskritic, and continuous with the Indo-Aryan identity claimed by contemporary (caste) Hindus. Stalin's announcement directly challenges this narrative by foregrounding southern archaeological sites that suggest a non-Hindu proto-Dravidian history, and potential links to the IVC itself. This paper examines how political conflicts unfold at the chronotopic intersection of archaeology and media—two rational, neoliberal industries that construct temporal narratives of world-ordering propensity. At this junction, neoliberal Hindutva and rationalist Dravidian past-presentisms compete to enchant India's ancient heritage.

Presenter(s): Sowparnika Balaswaminathan

Haunted Enclosures: Ghostly Presence in the Sundarbans' Aquaculture Industry

Capitalist transitions are often approached through reference to disenchantment. This paper develops an alternative account through a study of aquaculture in the Indian Sundarbans delta. My research with fishers shows that the creation of private, export-oriented fisheries in formerly common water bodies does not necessarily entail disenchantment from a more-than-human social world. Instead, I explore how these processes reorganize relationships between people, fish, and supernatural entities, including deities and ghosts. I argue that the creation of private property in water is a cosmologically rich process, and I demonstrate how—contrary to expectations—fishery owners have continued to maintain and negotiate relations with supernatural entities amid enclosure. I analyze these shifts through attention to fishing rituals, which did not simply reflect an age-old cosmology, but signaled important changes in relations between humans, nonhuman animals, and supernatural beings. Through these rituals, fish have become commodities to be exchanged between gods and humans rather than the sentient agents they were in the past, and certain supernatural entities have also transformed. Simultaneously, many have lost their previously intimate connections with the water commons. In this context, ghost stories (bhuter galpo) about "awakened" (jagroto) waters continued to circulate, haunting contemporary capitalist transitions and sustaining alternative visions of place and personhood.

Presenter(s): Calynn Dowler

Mediating Abundance: Confronting Specters of Scarcity in Indigenous Television Production

In January 2025, Taiwan's Chinese Nationalist Party proposed sweeping budget cuts across cultural sectors, including Taiwan Indigenous Television (TITV)—a public station by and for Taiwan's diverse Indigenous peoples. This mirrors similar state cuts to Indigenous media production budgets in Aotearoa, the US, and elsewhere. Cultural producers have long found creative ways to assert visual

sovereignty within settler systems (Raheja 2010). But contemporary populist politics and scarcity economics are placing even well-established Indigenous broadcasters at risk. Drawing on fieldwork with Indigenous media producers in Taiwan, I explore how producers at TITV respond to these precarities through what I call "media abundance." This paper is inspired by emergent studies of Indigenous economies of abundance in environmental, legal, and cartographic studies (Fujikane 2021, Kimmerer 2024). With an ethnographic focus on the daily practices of production at TITV, I show how, from children's shows to health programs, producers mediate abundance by forging relations of reciprocity and inclusivity, embedding production in extended kin relations with ancestors and future generations, lands and waters, and more-than-human persons. I argue that abundance activates an entwined politics of refusal and possibility: a refusal to let capitalist specters of scarcity define media production, and the production of Indigenous futures that flourish far beyond the limits of colonial imaginations.

Spectral Secularism: Paradoxes of Enchantment in Hindu Nationalist Aesthetic Production

This paper examines the tension between religious nationalism and secular modernity drawing on ethnographic research at a state-run fashion school in New Delhi. By analyzing how designers create clothing styles for the Hindu nationalist Bharatiya Janata Party, I identify a fundamental contradiction: the more aggressively the BJP state attempts to purge secular-cosmopolitan references, the more designers must employ secular principles in their creative processes. Drawing on Walter Benjamin's concept of 'dialectical images,' I theorize how designers strategically traverse competing value systems to arrange and 'enchant' ethnonationalist dress symbolism. While generating "Hindu supremacist" images (Baviskar 2023), their culture of production (Caldwell 2005; Ganti 2012) remains fundamentally structured by cosmopolitan training, global fashion sensibilities, and secular institutional histories. Thus, I suggest that the Hindu nationalist aesthetic project paradoxically depends on and reproduces elements of the secular frameworks it aims to displace; affirming not just the incompleteness of ideological projects, but the impossibility of achieving cultural purification. By analyzing how contemporary Indian designers traverse negotiations of style, politics, and career opportunities, this paper contributes to anthropological reconsiderations of secular/religious binaries, illuminating how competing temporalities materialize in aesthetic production under authoritarian rule.

7196 Resurfacing Feminist Genealogies of Care: Illness and Haunted Critique

Start Date: 11/21/2025 10:15 AM **through** 11/21/2025 11:45 AM

Venue: Sheraton **Room:** Gallier AB(4th fl)

Type: Oral Presentation Session

In the much-loved 1970s children's animated series, Scooby-Doo, there is frequently a moment in which one of the main characters removes a simple bedsheet to reveal that a ghost – haunting a pirate ship or a spooky mansion – was really Old Man Whittaker all along. Zinks! Gotcha! This iconic moment of revelation provides an unlikely but useful metaphor for understanding knowledge production in anthropology influenced by feminist accounts of political economy since Scooby-Doo started its run. In this panel, we are specifically interested in how care – as work, as relation, as emotion, as kinship webs – has been portrayed in studies of disability and illness and how feminist anthropology might better attend to its haunted critiques. While unveiling has its place, in this panel, we attempt to work with the step beyond the reveal. If we see care everywhere we turn in intersectional disability worlds, this entails intellectual and aesthetic work (itself a form of care) in which haunting is not the province of spectres and the unknowing, but of real people, in complicated, complicit relationships with one another. Meddling with the politics of care without any satisfying conclusion, this panel offers rich ethnographic examples (relationships to disabled relatives; labor and chronic illness; ancestral healing spaces; "functional disorders"; Sikh martial arts practices) to resurface how feminist political economy, and in particular Black feminist thought, not only illuminates relations that were there with us all along, but demands our acknowledgement of how things come to be hidden to begin with.

Presentation(s): The Ones Who Stayed and Fought: What does a feminist perspective on care add to histories of deinstitutionalization?

Several essays and books in recent years have generated wide public conversation of what Atlantic feature writer Jennifer Senior calls "the ones we sent away," referring to children with disabilities who were institutionalized, especially in the early post-WWII period. Based on feminist and queer critiques of biological relatedness and normate structures that exclude those with non-normative bodyminds – of which infamous "schools" are a very visceral example – these authors ask readers to unearth and embrace disabled kin. For disabled readers who may have kinship ties (genetic, care-based, regional, affinal) to ancestors who experienced the violence of institutionalization, these stories land quite differently. People with disabilities are concerned that these revisionist histories do the thing they are trying to combat: erase disabled voices. The "disappeared relative" becomes what Mitchell and Snyder call a "narrative prosthesis"; further, those individuals and families who historically performed the difficult work of resisting the push to institutionalization is erased in favor of a narrative that stresses the role of journalistic reportage in changing public attitudes about disability and care. In this paper, I consider how stories of expanded kinship might work differently if told from the perspective of "the ones who stayed and fought," including

contemporary disability activists who fight state-backed projects for medical and disability incarceration.

Presenter(s): Megan Moodie

Wages Against Sick Work: Chronic Illness and Economics of Exhaustion

Drawing from feminist critiques of reproductive labor and fieldwork with people with chronic fatigue syndrome (otherwise known as myalgic encephalomyelitis or ME/CFS) in the US, this paper presents a provocation: what if we recognized the labor of being ill, and paid for people to be sick, beyond the meagerness of the welfare state and the cultures of suspicion and shadow of malingering that surrounds it? I take lessons from Black feminist critiques of the welfare state (A. Davis 1981; D. Davis 2006), disability anthropology (Hartblay 2020; Durban 2022), disability studies (Kim 2024, Price 2015), and disabled activists (Hedva 2022; Piepza-Samarasinha 2018) to argue that for my interlocutors with ME/CFS, being sick is, itself, work. Faced with unrelenting symptoms of exhaustion, people with ME/CFS must work simply to sit upright; to fill out forms so that they can get disability insurance; to travel to doctors and ME/CFS specialists, some of whom may be halfway across the country. Just as Marxist feminists took wages for housework into wages against housework (Federici 1975), I show that to propose sickness as work is to resurface the iatrogenesis of the American healthcare system and welfare state themselves. Richer ethnographic descriptions of the complex and frequently-failing support systems surrounding an isolating chronic illness may well show feminist political economy has always been just under the surface of current debates around care.

Presenter(s): Emily Lim Rogers

On fluctuation and flickering – functional disorders, feminist epistemologies, and care

Functional disorders index the phenomenon in which someone is seriously ill – seizures, paralysis, complex pain, – and yet no pathophysiological cause can be found. Traditionally approached as psychic distress manifesting through the body, a contemporary language for hysteria, a multitude of explanations currently compete within Western biomedicine. These disorders evade and exceed clinical epistemologies and containment, causing unease wherever they appear as clinicians feel threatened and patients become rendered illegible and suspicious.

This presentation explores the reciprocal, murky attachments between illness, gender, knowledge, and the body. Drawing from ethnographic fieldwork with patients with suspected functional disorders and clinicians in a Canadian neuropsychiatric clinic, I ask how functional disorders are refigured if we look to feminist theory rather than biomedicine. Drawing on theorists such as Mel Chen, Teresa Brennan, Nancy Scheper-Hughes and Margaret Lock, and Octavia Butler, I argue that a feminist reading of functional disorders opens a radically different figure of relation with the world – one defined by porosity, non-innocent spatial and temporal attachments, and refraction. Furthermore, I am all too familiar with the violent and diminishing effects of biomedicine's approach to these disorders; as such, in the second half of this presentation I also explore a feminist approach to care.

Presenter(s): Daisy Couture

Homegirl Hauntings: The Sacred Geographies of Ancestral Conjuring in Black Feminist Healing Arts Praxis

This presentation explores the material and metaphysical healing spaces of Black women who are engaged in ancestral, astral, and inner child healing. It is grounded in what I call Black Feminist Healing Arts – the sacred practice of using art and ritual to cultivate spiritual, ancestral, and somatic healing. I use the term "homegirl" to honor everyday Black women who unapologetically engage in hood cultures of healing through aesthetic and linguistic praxis. Additionally, I use the term "hood" to celebrate the communal locales where these homegirls go to heal. I also provide an analysis of the ghetto as sacred, and the sacred as ghetto. By mapping sanctity onto the ghetto and mapping the ghetto onto sanctity, I expand understandings of everyday space making by locating transcendence within the neglected underworlds of Black women's intimate and interior lives.

I place these communal geographies in conversation with the interior geographies of the psyche where spirit space and imaginaries meet across varying ruptures in time/ space continuums. In locating these multiple sites of refuge, I illuminate how these women's sense of their own divinity affirms a right to humanity amidst the dehumanization of interlocking oppressions. As such, I argue that one of the most liberatory models of healing might be found within the creative refusal of these homegirls, whose spatial imaginaries of care challenge disciplinary assumptions about what it means to be well.

Presenter(s): Ree Botts

Uses of the Stick

The experience of mass torture permeates the affective field that gatka (Sikh stick-fighting) constitutes in California. I take gatka in California as a lens for the study of collective identity formation in the wake of state violence. Despite the community's ethnic, caste, and linguistic diversity, the category "Sikh" retains gendered and racialized valence. As a tool of capture, racialization reduces the diversity of Sikh culture and practice to a martiality that is masculine and loyal at best, and pathologically violent and unintelligent at worst.

This reputation continues to frame Sikh conflict with the modern Indian state. In the chaos of anti Sikh genocide in India - and a decades long Sikh resistance - many Sikhs fled Punjab and settled across the globe. Gatka in California was born of this fugitivity, as Sikh sought new ways to continue the fight for self-determination in Punjab.

Abolitionist scholarship, Black feminist anthropology, and crip theory grounds my photoethnographic exploration of the significance of gatka as a mode of empowerment, healing, and political action that is simultaneously collective and embodied. I remain attentive to the way images have not just circulated but produced knowledge about racial difference. I try to create images and videos that disrupt the sedimentation of gendered and racial common sense about

Sikhs, and instead reflect the affective regimes of care and resilience that sustain this community and its movements.

4665 Ethnography as Hauntology Across the Borderlands and the Black Atlantic

Start Date: 11/21/2025 10:15 AM **through** 11/21/2025 11:45 AM

Venue: Sheraton **Room:** Grand Ballroom D (5th fl)

Type: Roundtable/Town Hall

The in-between is a subject of investigation and speculation. The borderlands, the Black Atlantic – these unsettled territories and haunted waterways serve as metaphors for violent encounters, enslavement, and death, but also cultural convergence, mediation, creative survival, and transformation. The category of the in-between is itself a specter that offers an "ontological-like category that hovers between being and non-being, real and unreal, present and absent. Not quite ontological but hauntological" (Klima 2019, 19). In this sense, anthropologists stalk the spirit world for answers, for evidence of our ancestors, to know them, to document their stories, and to make them speak to us in a language we can understand. Experimental ethnography is a speculative practice of trying to make sense of experiences and events that are ineffably real, at once visceral, and beyond language. What responsibility do we have to these specters, these ancestors, these monstrous beings, besides waking them up, conjuring them into existence, and writing them into the real?

This roundtable brings together interdisciplinary Black Atlantic and US-Mexico Borderlands scholars to consider how ethnography, refashioned as a curative practice of anthropocura, might attend to events, spaces, or experiences that are ineffably real in that they escape traditional forms of empirical investigation or representation. Forged in the unruly, marginal, and fugitive folds between borderlands and Black Atlantic epistemologies, anthropocura traffics in contradiction, alternate realities, speculative imaginaries, time travel, and delirium. Its locuras (or theories) are inherently undisciplined. They emerge from methodologies cultivated in the fault lines of anthropology – Africana Studies, Critical Ethnic Studies, Feminist and Queer Studies and subjugated other/othered knowledge.

From the aftermath of the burning of a black church in Tennessee to migrant deaths and disappearances on the Texas-Mexico border to encounters/discounters with otherworldly beings in haunted thresholds, and the multivocal play of Black masking in New Orleans vis-à-vis the liminal spaces of Mardi Gras/Carnival, this roundtable explores methodological reimagining of ethnography not as mere observation or documentation, but as an engagement with the spectral, the unspoken, and what lingers -- the afterlives of trauma, silenced histories, and fugitive presences. At its heart is decolonial sanación, an anthropocura que cura.

2793 Narrating the Ghostly Temporalities of Korea

Start Date: 11/21/2025 10:15 AM **through** 11/21/2025 11:45 AM

Venue: Sheraton **Room:** Grand Ballroom E (5th fl)

Type: Oral Presentation Session

"After you died, I could not hold a funeral,

And so my life became a funeral." From Human Acts (Han 2014)

In her 2024 Nobel Prize Lecture, Han Kang reflected on two leitmotif questions that thread through her body of work: "Can the past help the present? Can the dead save the living?" Inspired by these questions, this panel explores how ethnographic narratives illuminate-and bind together-the porous boundaries between life and death, as well as between past, present, and future in Korean history and culture. It asks: How do narratives serve as conduits for memory, transmitting the past across generations? How do pain and trauma become legible, indelible, and meaningful through the acts of writing and recitation? And in what ways do narratives reclaim and reveal names, voices, and dignity from the ruins of erasure, violence, and historical trauma?

Bringing together papers that engage these questions, this panel examines how narratives become sites of grappling and (re)imagining Korea's past and present, trauma and healing, and violence and dignity. Through ethnographic case studies-including the work of commemorating and inheriting lives within the Korean LGBTQ+ community (Im), the creative activities of North Korean migrants to reconstruct their painful memories to develop emotional resilience (Shin), a grassroots arts project grounded in narratives by and about the Post-Korean War Korean ginseng traveling vendor women (Lee), and creative care practices developed by young women with suicidality (Kwon)-the panel explores ghostly temporalities and the spectral presence of history in contemporary Korean life. Together, the panelists invite dialogue on how these haunting pasts and their imaginaries offer an ethnographic lens through which to analyze and make sense of Korea's present and future conditions and forms of life.

Presentation(s): Names: Remembering and Inheriting Lives in South Korean Queer Community

This paper aims to reveal the names of those who have left me too early in the Korean LGBTQ+ community. It is not a metanarrative. Instead, it is a mid-level narrative and an autoethnographic response to Han Kang's question: "Can the dead save the living?" Therefore, the narrator uses "they" and "we" interchangeably throughout the paper. The narrator-ethnographer also asks, "Can the living save the dead?"

In the South Korean queer community, the dead are not necessarily the past. The dead are and always have been the present. The dead are also our dear friends. Thus, death is never the past that we can lightheartedly pass, erase, and move on. Many people fear that those passings might not be sufficiently mourned and that death might be in their community's future as well. Many of us witnessed or experienced the porosity between life and death too frequently and early in our individual and collective life journeys. Therefore, the porosity is overtly recognized and recited in Korean queer community spaces. The paper illuminates how it leads some community members to anchor their political narratives to the concept of "existence" (chonjae). Chonjae encompasses various forms of life with dignity in their narratives about life and death. By revealing the names, this paper shows why and how death is not the past and proposes to reconsider progress-oriented ideologies of time in Korea from a queer ethnographic perspective.

Reconstructing Painful Memories through Creative Activities: North Korean Migrant Artists in South Korea

This paper examines how North Korean migrants (hereafter NKM) process their painful memories and experiences of North Korea through creative activities while living in South Korea. Specifically, I focus on their feeling of longing for separated or lost loved ones as well as emotional debt and regret for leaving their home country behind. Based on the ethnographic research conducted with thirty-five NKM artists in South Korea between April 2021 and May 2022, this paper first addresses how NKM artists gain psychological distance from distressing memories by expressing them in artistic forms. Through these expressive forms, they (re)construct narratives of ineffable traumatic experiences, leading to their understanding of their lived experiences. Second, I examine how NKM artists' creative activities serve as an in-between space where they imagine reunification with their separate or lost families. These imaginary interactions allow them to navigate the feelings of sorrow and sorrowiness toward their loved ones. Ultimately, this study demonstrates how creative activities contribute to NKM artists' emotional resilience toward their past, present, and future by reconstructing their painful experiences and memories.

My Mom's Scent: Qualia and Sensuous Temporalities in Narratives of Insam-Haengsang (Ginseng Traveling Vendor) Women

In Post-War Korea, insam haengsang—women who traveled between cities with a basket filled with insam (Korean ginseng)—distributed Korean ginseng from farm fields to market towns and metropolises. Despite their key role in connecting rural and urban economies, insam haengsang

women have been rendered invisible in dominant historical accounts of postwar Korea. This paper centers on a community-based grassroots art project in Geumsan, South Korea, that commemorates these women, along with collected narratives of those who worked as insam haengsang in the 1960s-80s. Following the grassroots art project's evolving storytelling practices—including a children's book, a stage play, and a song, it analyzes how the qualia of insam scent is not a mere sensorial trace but a historico-political device in community-based history-making practices. The paper examines how the qualia of insam scent enables a sensuous reconfiguration of temporality, bridging the gap between different timelines, genders, and generations in and across the narrated and narrating events. In so doing, it investigates how qualia and sensuous temporalities give form to feminist historical imaginaries, in which silenced and ignored subjects and their voices are refigured not only as remembered but also as re-lived.

Presenter(s): Hyemin Lee

Care Experts: (Self-)Care Practices Among Young Women with Suicidality in South Korea

This paper examines the creative and expansive (self-)care practices developed by young Korean women who have experienced suicidality. Drawing on ethnographic fieldwork (2021-2022) with women in their twenties and thirties, I explore how they transform long-term suffering into innovative care strategies. Many trace the onset of their suicidality to their early teens, describing it as persistent and accumulating distress that has haunted them ever since. However, against this ghosted past, they have crafted practices to navigate the present, critique the past, and envision alternative futures. These include writing fantasy novels, forming "alternative families," volunteering, and engaging in activism that extends beyond the domain of mental health. I conceptualize these women as care experts—a term I coin to highlight their expertise in reimagining care through sustained self-reflection and critical engagement with enduring violence. Their practices blur the line between individual and collective care, expanding self-care beyond individualistic models and framing it as communal, transgressive, and political. By approaching care as both personal and political, these women challenge patriarchal environments, gendered norms, and a society that often fails to accommodate differences. Ultimately, I argue that their everyday care practices position them as potential agents of sociopolitical transformation, offering vital insights into the entanglement of ghosted temporalities.

8593 Proposal Writing for the Wenner-Gren Foundation

Start Date: 11/21/2025 10:15 AM **through** 11/21/2025 11:45 AM

Venue: Sheraton **Room:** Grand Chenier (5th fl)

Type: Workshop

Join us for a conversation on how the Wenner-Gren Foundation is facing these difficult times. Funding for research is in short supply, but we remain committed to supporting anthropologists.

We'll offer an overview of our programs and some tips for applying for our research grants. There will be plenty of time for discussion.

3323 Michel-Rolph Trouillot in the World Economy: Peasants and Capital, Revisited

Start Date: 11/21/2025 10:15 AM **through** 11/21/2025 11:45 AM

Venue: Sheraton **Room:** Maurepas (3rd fl)

Type: Roundtable/Town Hall

Michel-Rolph Trouillot, our late colleague, historical anthropologist, and Caribbean theorist par excellence, is venerated as an intellectual ancestor across our discipline. Where his writings on history and historicity, anthropology and the savage slot, the culture concept and its malcontents have earned him pride of place on introductory courses and core graduate curricula, the canonization of Trouillot has often neglected his earliest writings on Caribbean peasantries laboring at the so-called peripheries of a capitalist world system. With an eye toward the 2025 AAA Conference Theme, "Ghosts," this session considers how the uneven incorporation of Trouillot into an anthropological canon generates its own erasures and silences.

This roundtable takes the publication of a new edition of Trouillot's first English-language monograph, *Peasants and Capital: Dominica in the World Economy* (Hau Books, 2025), as an occasion to meditate on the development and legacy of Trouillot's earliest field research on banana cultivators in the Eastern Caribbean. Where the influence of *Peasants and Capital* endured in the decades since its initial release in 1988 with homages to its multiscalar analysis by anthropologists Deborah Thomas and Vanessa Agard-Jones, this legacy coincided with the retreat of Trouillot's monograph and studies on the Caribbean peasantries, more broadly, from anthropological view. The decimation of Caribbean banana economies in the aftermath of the "banana wars" waged by the World Trade Organization in the 1990s dealt a final blow to the peasant as a fixture of Caribbean ethnography. Convened in the historic banana port of New Orleans, this session returns to *Peasants and Capital* to forge an agenda for an anthropology of the 21st Century informed by Caribbean transformations and their resonances in archipelagic regions beyond the Atlantic.

In turn, this session considers what anthropology could have been (and may still yet become) if we embrace the model of historical anthropology modeled by *Peasants and Capital*. Anthropology, for Trouillot, embraced archival methods and multi-sited ethnography along the commodity chain of Dominican bananas. Extending this model to their research in the Caribbean, Africa, and Southeast Asia, participants in this roundtable will offer urgent revisions to anthropological theory and method at a moment of structural adjustment, climate disasters, and novel repertoires of workers' autonomy and autogestión at the so-called peripheries of the world economy.

3784 Population Aging and Its Discontents: Gendered & Gerontological Imaginations 'On the Make'

Start Date: 11/21/2025 10:15 AM **through** 11/21/2025 11:45 AM

Venue: Sheraton **Room:** Napoleon BR A1 & A2 (3rd fl)

Type: Oral Presentation Session

Once presumed to be a problem limited to wealthy, welfare states, population aging has become the dominant global discourse used to raise alarms that rising numbers of "old" people are unsustainable for national market-economies and families (as "informal care systems"). Gendered presumptions add that female-identified people face a "double jeopardy" of sexism and ageism through maturity past adulthood. The state tasks itself as source of solutions, replacing imagined loss of interdependencies and agency. Despite academic research challenging claims that biology separates sociality into the dependent (as young, old, and female) from the productive (as adult, male), population aging in gerontological imagination has manifested through state level interventions, such as age-care policies and technologies, and responses from older adults. Through international networks and globalizing political-economies, how people experience age and gender collapses into a dominant narrative used to naturalize structured dependencies of inequality and social injustice. Thus, gendered and gerontological imaginations have been 'on the make.' Yet, reifications of identity, agency, and dependency require replication, which can invite resistance and re-imaginings. The papers on this panel explore reifications, resistance, and re-imaginings of aging at the levels of state intervention and research engagements with older adults. We find an active, innovating state as well as varying levels of agency and innovation among people stratified by age, gender, racialization, and class. For example, papers variably describe discontent over presumptions in population aging discourse of lost tradition and of gains through modernization. Attention to intersections of social class and migration experiences demonstrates how fears of aging as unsupported longevity, coupled with loss of intergenerational solidarities (and entanglements), contributes to socio-economic precarity and epistemic uncertainty. At the same time, extended longevity in the midst of affluence can pressure re-negotiations of gender, race, and heteronormativity. Contrary to "double jeopardy" myths, retirement and widowhood can provoke transformation more akin to adolescence than abandonment. These papers challenge and transcend the classic modernization ontology of "old" age as gendered dependency and naturalized discontent, while calling for more intersectional study of gerontological imaginations "on the make."

Presentation(s): Technological Care and the Gendered Politics of Aging in China

In contemporary China, elderly care is shifting from family-based filial piety—historically carried by the unpaid labor of women—to a marketized, technology-driven commodity. Digital platforms, wearable sensors, and smart home systems promise "silver economy" growth, transforming older adults into both consumers and subjects of surveillance. This commodification of care unfolds with the imperative to "expand domestic economic demand." Care becomes a site of economic productivity, while "caring for the elderly" shifts from interpersonal presence to the management of potential risks, dependency, and uncertainty. In this shift, technological innovation—commonly framed as rational, masculine, and future-oriented—enters the domain of care as a technocratic solution to structural challenges. Yet, this technocratic infrastructure does not eliminate gendered labor; it redistributes and renders it invisible. The language of efficiency, scalability, and optimization often obscures the continued reliance on women's labor, now mediated through digital tools. Women continue to bear primary responsibility for coordinating care, now mediated through remote monitoring tools, scheduling applications, and affective labor via digital interfaces. Aging women thus find themselves caught between two worlds: the erosion of intimate, reciprocal caregiving, and the rise of a digitized, datafied future still marked by structural inequalities and invisible work.

Memories of Respect, Stories of Neglect: Aging Among Older African Immigrants in the United States

This paper analyzes anxieties and desires among older Africans living in the US as they negotiate divergent approaches to health, knowledge, and family. Many who came to the US before the 1990s view older Africans as knowledge holders who support family and community. Through ontological imaginations of "tradition" and "gender," male elders are public leaders and cultural custodians, while female elders are respected for their wisdom in family matters, caregiving, and community cohesion. More recent immigrants, however, have experienced seeing older members of their communities in Africa isolated, marginalized, and in poor health. The frequent circulation of stories of older individuals asking younger generations for financial support for medicine, for instance, undermines the types of respect that were once anticipated. Those working in US health care see that many of their American patients rarely receive guests and, in other situations, suffer neglect and abuse in nursing homes or hospice care. Given the tenuous position of many members of the African immigrant community, the multiple views of aging often brings diverse anxieties including being a burden on their own families, encountering personal neglect in healthcare systems, and/or losing respect as knowledge holders as one ages. These anxieties often create a desire among African immigrants to return to their home countries and to a time where positive memories of being a respected elder once existed.

Women Rewriting the Hindu Perspective on Aging in India

My 90-year-old mother lives in her ancestral home with two full-time helpers in Odisha. At 58, she lost her world when my father passed away. In the traditional Hindu system, a widow becomes rudderless and dependent on her sons. My mother has rewritten the normative model of aging and widowhood. She has learned to be independent, defying the normative expectations of old age and widowhood. Based on ethnographic research in Odisha, I examine older women's resilience and strategies for constructing selfhood in terms of choice of residence, lifestyle, and companionship given the absence of adult sons and the disintegration of joint families under the pressure of global capitalism. Along with the AAA 2025 annual meeting theme 'Ghosts,' I argue that in aging India, older women construct new ways of living in the capitalist society while sons are haunted by their inability to perform their dharma (duty) to care for their older parents. This paper will focus on the innovative older Hindu women across region, class and caste, rewriting the normative script on gender and aging. Through auto-ethnography, I incorporate insights I gained by taking care of my 90-year-old mother as her overseas daughter.

Presenter(s): Annapurna Pandey

Transforming the ageless self: Re-framing aging related identity crises in China

In western social science traditions, the pursuit and cultivation of a personal identity is generally understood to be the province of adolescents. Once people reach adulthood, it's assumed that personalities have stabilized into an "ageless self" (Kaufman 1986) that should be maintained throughout the life course and into which new experiences and insights can be integrated. While such a concept challenges population aging discourse, in which old age is simply a period of decline, casting radical departures from earlier versions of the self as "crises" can also lead older adults to fear the specter of age-related shifts in relationships, priorities, and desires. In this paper, based on research conducted on retirees' efforts to pursue new dreams and re-imagine their identities in urban China, I argue that conventional wisdom about the interaction between age and identity are in large part influenced by history and economics: in mainland China, it is older adults—not youths—who are afforded the space and understanding to experiment with different ideas and aesthetics. I contend that major developmental leaps are not possible in later life, and these leaps can improve gerontological imagination through deeper understandings of how people create meaning throughout the life course.

Presenter(s): Claudia Huang

Age, death, and disabilities as generative challenges to gendered dependency in an affluent retirement facility in the U.S.

Feminist gerontologists have long argued that much of what makes "old" age difficult is more about social constructs and less about time. And, despite an "aging enterprise" in the U.S., in which the state promises to assume the risks of old age decline and loss, growing "old" continues to bring fear and stigma. "Healthy" and "anti" aging public and private initiatives promote extending the productivity associated with adult maturity well past retirement ages of 65+. In this study, wealthy

retirees and spouses have selected a U.S. "life plan community," which promotes extended activity and provides care as needed. Yet, those who live into 85+ ages experience limits to life as a planned enterprise. Such limitations can become generative: Losses to bodies and minds, coupled with that of long-term spouses, creates crisis and opportunity to re-imagine gendered norms, compulsory heterosexuality, and racial privilege through the unlikely protagonist of unrelenting discontent. Extended longevity in this five-year field study (2020-2025), experienced by far more women than men, has invited innovation of mind and body-selves through acceptance of irrevocable loss.

Venue: Sheraton **Room:** Napoleon BR A3 (3rd fl)

Type: Oral Presentation Session

The anthropology of education has a long history of engaging critically with ideas about "success" and "failure" in schooling—documenting how the success of some is premised on the failure of others (Varenne and McDermott 1998), interrogating the conditions under which success is produced in elite contexts (Demerath 2009), pointing to students' resistance to the success/failure binary (Valdés 2001), confronting individual identities associated with academic success (McDermott 2004), demonstrating competence outside the norms for success (Gilmore 1985), showing that apparent success may mask enduring inequalities and hierarchies (Brown 2015), and troubling the equation of success with "schoolish exchange value" (Blum 2024)--to name just a few.

In this session, we present new ethnographic findings from a wide range of educational contexts, including out-of-school time nonprofit organizations, secondary schooling in the Solomon Islands, undergraduate research experiences in observational astronomy, and land-based teacher professional development, that productively problematize assumptions about how success is defined in education, who gets to decide those 'metrics', as well as who is eligible to succeed and on what terms.

Abbie Cohen's paper investigates how prevailing definitions and measurements of success shape the practices and processes of out-of-school time organizations—educational spaces that aim to distinguish themselves from traditional public school classrooms, yet increasingly adopt the very accountability structures they aim to resist. Her research, however, reveals that the pressure to demonstrate particular success measurements are driven not by state mandates, but by the influence and power of private philanthropic actors. Examining the secondary school experiences of students in Solomon Islands, Rachel Emerine Hicks identifies obstacles to the educational success of students while showing the family relationships that motivate students to do well in school despite these obstacles. Vanessa Anthony-Stevens and Philip Stevens present a vision of academic raiding as the appropriation of academic goods to rehistoricize and resituate knowledge

production in order to uphold Indigenous communities. Brendan O'Connor probes the conditions under which undergraduate researchers in astrophysics come to be regarded (and regard themselves) as qualified novices, or agents capable of becoming more knowledgeable, responsible, and useful within their research groups. More broadly, Peter Demerath explores how anthropology can help narrow the distance between what we know about how humans learn, and how Western schools have historically developed.

This year's conference theme of "Ghosts" offers an opportunity to look to the past—the impacts of normalized (but oftentimes limited and narrow) notions of success— and a gaze towards the future—where success might be more humanized, generative, and built from communities most impacted.

Presentation(s): The art and science of academic raiding in higher education: Ethnographic observations from Indigenous education

In response to cultural chauvinistic pedagogy and knowledge-making within "Whitestream" culture education and pedagogy (Urrieta, 2004), this paper will explore the particulars of academic raiding, an on-going teaching and learning method utilized by Indigenous faculty and students, and applied in curricular programming designed around needs and desires of U.S. based Tribal Nations. Academic Raiding (Stevens & Anthony-Stevens, 2025), an Apache practice of engaging in intelligent and necessary action in appropriating goods—material, intellectual, and relational—to sustain their community's culture and way of life, is analyzed as a dynamic praxis transforming the conditions of place-less and de-historicized knowledge production. We draw from ethnographic observations in two examples of collaborative participatory research design within higher education collectives serving interdisciplinary STEM graduate students and a land-based teacher professional development programming to examine the delicate interface between the material conditions of settler-colonial institutions and the Indigenous imagination to dream beyond the confines of colonizing university. Examples of academic raiding build on centuries of relational and adaptive 'know-how' and provide hope within harmful institutional technologies to re-assemble place-based and epistemologically diverse lenses of knowledge production in formations that further the well-being of Indigenous communities, not the academy.

Defining Success in Out-of-School Time Programming

This paper explores a growing educational site that supports public school students: youth-serving out-of-school time (OST) organizations. This paper asks: How do different organizational

stakeholders define success? Based on an ethnographic study in partnership with an OST program, this paper found that as some OST programs were designed to counteract the oppressive and racialized logics of traditional school, they started to be shaped, measured, and defined in similar ways. My qualitative analysis reveals how a multiracial group of stakeholders most intimately tied to the organization (staff, mentors, parents) define success collectively oriented towards systemic change, relationships, compassion, care, and fun, whereas more distant, yet powerful elite white stakeholders (funders, board members), define success at the individual level proven by quantifiable numbers. This paper illustrates how the data-driven and numbers-obsessed metrics imported into public education during the neoliberal turn have also begun to transform OST learning spaces. In OST spaces, importantly, the metrics are defined by unelected and oftentimes unaccountable private philanthropic stakeholders. This paper advances critical research on the way privatization, marketization, and datafication has exacerbated OST learning spaces through a racialized lens, and wrestles with what can be done to reimagine stories of success from those experiencing OST programming.

Presenter(s): Abbie Cohen

The intersecting obstacles to student success in Solomon Islands

In Solomon Islands, students regularly emphasized that they must "skul gud" (do well in school) to give back to the families who supported their education. For these young people, doing well in school meant passing your exams and continuing your education as long as possible to find a well-paid job. For these young people, success in school was more than individualized advancement, it meant being able to give back financially to the family who invested in their schooling. However, the design of the education system in Solomon Islands made it difficult for students to succeed in school. In this paper, I describe what I call "The Cycle of Obstacles to Student Success" – obstacles such as exam-based education, overcrowding, and absenteeism that intersect, lowering the quality of education. The effects of these obstacles meant that students lacked readiness for school exams and career opportunities after schooling. When the obstacles limited the students' opportunities for educational success, students considered other ways that they could still contribute to their families financially. By sharing the educational journeys of youth in Solomon Islands, I consider what success means on an individual and community level and what drives students to "skul gud" amidst the obstacles they face.

Presenter(s): Rachel Emerine Hicks

The role of Anthropology in making schools more human

For over 200 years Western schools have been guided by a set of assumptions and practices that have had corrosive and delimiting effects on the lives and futures of millions of children worldwide. Anthropology, as the "study of ways of being human" (Helm, 2005, p. 6), offers perspectives that can correct many of these faulty beliefs about who we are and how we learn. In our research studies, we can center Anthropology's commitment to interrelatedness and context, and its understandings of people as social, emotional, curious, and adapted to learn, yet deeply affected

by visible and invisible flows of power. In our studies of schools and educational processes, we can bring to the surface and question beliefs and practices still guided by the long reach of individualistic psychology, external motivation, competitive and neoliberal individualisms, patriarchy, coloniality, and most importantly, norms of whiteness and Eurocentrism. We can ferret out the "rot" that persists from older and more exclusive models of schooling. We can use our research evidence and the tools of interpretive science to show how schools can ensure their students always see themselves in their curriculum and teachers, how they can help their students locate hope, and how they can develop more expansive communities and solidarities that can counter new radical individualisms. In this way we can contribute to the enduring project of making schools, in anthropological terms, more human.

3002 (The George Stocking Jr. Symposium) The New Negro @ 100: Anthropology and The Anthology That Catapulted a Movement

Start Date: 11/21/2025 10:15 AM **through** 11/21/2025 11:45 AM

Venue: Sheraton **Room:** Napoleon BR B1 (3rd fl)

Type: Oral Presentation Session

In 1925 Alain Locke published the "The New Negro," which brought together artists and social scientists of the emerging Harlem Renaissance or the New Negro movement. Zora Neale Hurston, Arthur Fauset, and Melville Herskovits all made contributions. Elsie Clews Parsons, The Hampton Folklore Society, and the "Journal of American Folk-Lore" were routinely cited, and Franz Boas and American Anthropology heavily influenced each. For the first time, anthropology was used to celebrate, explore, and describe African American culture as distinctive, specific, beautiful, and rooted to an African past. These papers directly or indirectly interrogate how anthropology was positioned as an academic discipline in the 1920s as a liberating discipline that showcased, celebrated, and interrogated Black culture and folklore -- pioneering the anthropology of diasporic cultures and performances today.

Discussant: Tracie Canada, Duke University, Department of Cultural Anthropology

Presentation(s): Beyond B'rer Rabbit: Arthur Fauset and Scientific Folklore

Arthur Huff Fauset wrote "American Negro Folk Literature" as his chapter in Alain Locke's anthology. He argued that Folklore must be collected and analyzed systematically and scientifically, not left to the literary amateur. Beyond critiquing amateurs, he specifically challenges Joel Chandler Harris who "assumes to interpret Negro character instead of simply telling his stories. The result is a composite picture of the ante-bellum Negro that fits exactly into the conception of the type of Negro which so many white people would like to think once existed." This paper will explore Fauset's contribution to the volume as well as his critique of "entertaining" interpretations of Negro Folklore, and his collection of stories from "Cugo" [sic.] Lewis," who becomes Zora Neale Hurston's informant in "Baracoon."

Presenter(s): Lee D Baker

Zora Neale Hurston's Interpretation of New Negro Womanhood

As the editor of *The New Negro: An Interpretation*, Alain Locke shaped the themes that would undergird Black cosmopolitanism and Black modernism, and he wrote the script for what became known as the Harlem Renaissance. Locke's vision for the emergence of the New Negro meant the birth of a new set of ideas. One of those was that African American life had moved away from aggressive emulation of White American values toward the search for an alternative, healthy, more self-accepting value system.

Only six out of thirty-five authors in Alain Locke's *The New Negro* were women. While only seventeen percent of the content, the inclusion of Black women in this volume was an important testament to Locke's commitment to Black women's position within new imaginings of the race. One, Zora Neale Hurston, is probably the most well-known of those women and one of two anthropologists.

. I argue that while we hear a great deal about Hurston's work with Boas as important to her development as a folklorist, ethnographer, and author, being published in *The New Negro*, and mentored by Alain Locke who also had a patron relationship with Charlotte Osgood Mason and introduced Hurston and Hughes to "the Godmother" also plays an important role that has not been fully explored. Centering Zora Neale Hurston's biography and her reoccurring themes on Black love, male-female relationships, and gender norms across class, this paper interrogates Hurston's "New Black womanhood."

Presenter(s): Riché Barnes

Anthropology and the Harlem Renaissance: The New Negro and Zora Neale Hurston's "Spunk"

Zora Neale Hurston's short story "Spunk" represents a significant contribution to Alain Locke's landmark anthology, *The New Negro* (1925), which helped define the Harlem Renaissance. What makes Hurston's work particularly distinctive is how she infused her literary output with her anthropological training and field research.

Through a close reading of "Spunk," with African American culture in mind, this paper highlights specific ethnographic approaches - linguistic preservation, participant-observer perspective, and

documentation of folk epistemologies - that transformed rural Black cultural expression from object of study to subject of artistic and cultural legitimacy. It can be argued that Hurston's fiction established an early model of merging insider cultural knowledge with rigorous anthropological approaches. A complete understanding of The New Negro's century-long impact compels us to acknowledge Hurston's groundbreaking methodological contributions demonstrating how her fiction, enhanced by anthropological approaches, helped create the intellectual framework that supported the cultural, political, and artistic ambitions of the Harlem Renaissance.

Presenter(s): Kimberly Simmons

Records of Existence: Arturo Schomburg Documenting Black Diasporic Cultures

Alain Locke presented the historic critical record of diasporic cultures, "The New Negro," as a corrective to early 20th century narratives of Black lives—in so doing, shifted the discourse on Black cultures. The New Negro also marks larger discussions around Black representation in the historical record and scholarship of the twentieth century. Archivist, curator, writer, and historian Arturo Schomburg contributed a chapter addressing his dedication to collecting and curating artifacts and studies from anthropology and other disciplines to document a historically accurate record of Black people. Schomburg's work signals the significant movement of, but not limited to, Black scholars, activists, archivists, writers, and poets of that period who challenged exclusionary knowledge production practices by preserving documentation/evidence of the diaspora to prevent the erasure of representative Black and Latinx experiences in the historical record and archives. In this paper, I explore Schomburg's foundational role in developing diasporic archival practice and Black knowledge production. Also considered are critical understandings of Black knowledge production represented in fields of study such as mid-20th-century Black Liberation Anthropology, and how questions about knowledge construction are being brought forward today in ethnographic and living archives of Black communities. His archives became the basis for the Schomburg Center for Research in Black Culture.

Presenter(s): Kamela Heyward-Rotimi

Identity at the Intersection: New Pathways Through Poetry

Identity at the Intersection: New Pathways Through Poetry is an essay that examines a new interpretation of The New Negro Movement. Coined by philosopher Alain Locke in the early 20th century to characterize African American Life and Culture, I argue that the poetry of contemporary African American poets is a continuum of this cultural phenomena. In this essay, I will illustrate how the New Negro Movement has survived through cotemporary poetry, evidenced in the poetry of several writers.

In his day, Locke was most interested in how African American writers addressed issues of race consciousness, activism, and leadership and I will examine these same themes. From a contemporary, socio-cultural lens, my essay will illustrate how African American poets use their voices in a political climate not dissimilar from the writers of the New Negro Movement, beginning in 1925. I created a course, Rhyme & Reason: African American Poets in Dialogue with Notions of

Slavery, Identity and Existence, and in it, I teach about the significance of the New Negro Movement and its relevance in our current social – political landscape.

Identity at the Intersection: New Pathways Through Poetry will not only provide readers with how contemporary poetry mirrors similar issues of the New Negro Movement, but will also provide classroom activities and tools to be used while having difficult conversations. In effect, meeting people where there are, at the intersection of difference.

Presenter(s): Jason Vasser-Elong

Sounding the New Negro: Music, Respectability, and Black Intellectual Praxis

Creative expression and innovation were central to Alain Locke's paradigm of the "New Negro." He recognized the political potential of music-making practices, framing this new mode of intellectual contribution as a pathway to African Americans' "spiritual emancipation." Yet Locke's analysis reproduced sonic hierarchies, ambivalently demoting Black artistic forms like jazz and blues in favor of the concertized Negro spiritual. Through this performance of sonic respectability politics, he overlooked the ways that vernacular Black music functioned both as cultural memory and as rich ethnographic material. This paper traces the productive tensions between Harlem Renaissance figures—Locke, Paul Laurence Dunbar, and Zora Neale Hurston—whose writings and performances variously theorized Black musical forms as sites of knowledge production. I analyze how these intellectuals navigated issues of legibility, class, and cultural authenticity, and how their engagements with music prefigure Black anthropological thought. In doing so, I argue that Black musical praxis served not only as creative expression, but as an intellectual method for theorizing race, community, and the politics of representation.

2815 Interrogating photography's in/visibilities: A roundtable on Photography, Power, and the Politics of Visibility in Anthropology

Start Date: 11/21/2025 10:15 AM **through** 11/21/2025 11:45 AM

Venue: Sheraton **Room:** Napoleon BR B2 (3rd fl)

Type: Roundtable/Town Hall

Moving away from a singular focus on the politics of representation, contemporary anthropological engagements with photography consider how photographic images and practices can actively engage with what cannot be seen, what remains invisible, or what has been rendered absent. This inquiry is particularly timely, as contemporary visualities are haunted not only by enduring specters of the past but also by new "ghosts" in political and technological realms. These include the simultaneous rise of generative AI and fascist political regimes globally, as well as emerging procedures associated with operational images and nonhuman photography. These new specters challenge traditional notions of visibility, representation, and reality, making it crucial to question the politics of the invisible in understanding emerging technologies.

This roundtable takes seriously the relationship between photography and forms of knowledge production by critically engaging with photography's indexical and evidentiary qualities. It seeks to explore how photography - as media, medium, and practice - can make visible what cannot be seen. In this sense, it examines alternative visual practices that challenge conventional ways of seeing. We explore how photography can expose social tensions and challenge dominant narratives, evoking spectral presences, unsettling fixed meanings, and inspiring new ways of knowing that maintain the tensions enabled by the photographic image. This performative aspect positions photography as an active agent in cultural and political dialogue.

By engaging with artistic collaborations, archival interventions, and experimental ethnography, this roundtable emphasizes the aesthetic, sensory, and narrative strategies that bring absences into view. It examines alternative visual practices that challenge conventional ways of seeing, broadening ethnographic practices and enhancing the understanding of non-conventional visual research in anthropology.

Drawing on specific case studies - such as forensic photography in post-violence contexts, analog practices that use plant chemistries to explore histories of toxicity, migrant visualities through photography and jewelry-making, specters of thermic inequalities through thermal photography, photographic traces in conflict and counterinsurgency contexts, and "agitating images" in Indigenous and Soviet contexts-this roundtable invites reflection on the transformative potential of photography to resist visibility, evoke the unspoken, and open new spaces for imagining the invisible.

3347 The Enchanted Politics of Ghosts, Spirits, and the Dead

Start Date: 11/21/2025 10:15 AM **through** 11/21/2025 11:45 AM

Venue: Sheraton **Room:** Napoleon BR B3 (3rd fl)

Type: Oral Presentation Session

Ghosts, spirits, and the dead are often used as metaphors for social critique. Anthropological approaches that take ghosts seriously have provided an important intervention in our understanding of human experience, but have fallen short because of the primacy of a secular political frame in anthropological imagination. This has hindered a more radical version of this departure. We propose that these other-than-human entities cannot be reduced to the politics of the living. In this panel we ask-how might an enchanted world inform a disenchanted anthropological approach to politics?

Anthropology sees itself as the most reflexive social science, and yet those expectations of ethnographic reflexivity are largely limited to a secular humanist politics. Despite these expectations of ethnographic reflexivity, anthropologists resist the interrogation of their own cosmological positionality. Our papers collectively reframe these questions to include enchanted worlds in a more expansive imagination of what the political entails for the anthropologist and their interlocutors.

These papers are rooted in the region and communities of Southeast Asia, where ghosts, spirits, ancestors, and nonliving beings have always been interconnected with the living. Southeast Asian ontologies, cosmologies, and epistemologies articulate complex interplays between humans and these other-than-human entities. They intervene in an unjust human world, offering up power to resist and challenge systems of abuse such as sexual assault and marginalization. Spirit interventions in human ordeals suggest that it is not so much the dead to be feared but humans themselves. Humans also capture the potentiality of utilizing the ghostly or the dead's speech patterns to subvert the moral expectations of the humanly world they live within. Those who are stateless draw on their memories of ancient kingdoms and their future deaths as a reminder that life is only granted through the dead, and that the living is the soon-to-be dead. In a stateless ontology of the dead, nation-states and their borders do not hold a monopoly on sovereignty, and political struggle continues in the afterlife. As life is only possible through the dead, ultimate sovereignty too is only granted by ghosts, the dead, and ancestors.

Presentation(s): Abnormal Speech and the Morality of Wild Spirits

The performance of "abnormal speech" animates the moral landscape of Human-Other interactions. In this presentation, I analyze the morphological marking of speech to frame human encounters with wild spirits in upland Laos. First, I present a story called "Person and Nya Wai Become Friends", told by a speaker of Ksingmul, an Austroasiatic language spoken near the Lao-Vietnam border. The story tells of a competition of trickery between a human and a wild spirit. In the telling of this story, the narrator marks the words of the spirit with a br- prefix that marks the "abnormal speech" of a non-human. To further unpack this semiotics of abnormality, I then discuss the expressive marking of morally ambiguous situations in Bit, a language related to Ksingmul. Bit storytellers mark narrative with a kr- prefix that animates the implications of ritual transgression. Another prefix br- is used to evoke feelings of disgust in the depiction of human-spirit conflict. Such linguistic performances are indexical of how power structures are negotiated, constructed and subverted in the depiction of sociality in a multi-animate landscape.

Presenter(s): Nathan Badenoch

Weretigers are a girl's best friend

Across Southeast Asia, weretigers are said to be invasive spirits who enter a human host from where they can attack their victims. My focus is on a twist on this idea of a threatening spirit, where being possessed by the tiger spirit instead offers security against a dangerous world. Three films from Thailand during 1963-1976 concern a girl/woman who unwittingly hosted a tiger spirit. Whenever she was threatened with sexual assault the tiger would take over and kill her attackers, after which the young woman would regain consciousness. The spirit was a protector of its host and did not present any danger except to those wanting to harm her. The three versions of the drama combine horror, fun, reflexivity and social commentary. In the first two versions, the tiger spirit gets the woman safely toward a promising future by age 20. However, she is killed at the end of the latest film, where loss, harm, and grief seem inevitable.

Presenter(s): Hjorleifur Jonsson

Cosmo-politics, Ancestral Personhood, and Broadening the Frame for Political Action and Critique

The everyday rituals that saturate Hmong life are pervaded with political critique and political action. However, the anthropological tendency to reduce religion to politics—and specifically to the immanent, secular humanist political imagination that dominates our discipline—misses the point entirely. Rather, we need a broader cosmo-political frame to understand the cosmologically expansive political projects in which my Hmong interlocutors are playing out their lives. In this paper, I unpack ethnographic experience and ritual actions that delineate Hmong political projects that transgress the immanent frame imagined by the secular humanism that underwrites anthropological political economic theory. The broader frame of Hmong cosmopolitics includes ancestors, ambient spirits, an expansive life course that precedes human birth and extends beyond the parting of the three souls at death, and a spiritual domain in which the ancient oppression from the Chinese empire continues as a political and military threat in the afterlife. I unpack a range of ritual and healing practices to demonstrate the depth and breadth of this cosmopolitical project, including shamanic healing (ua neeb), funeral rites (Txiv Xaiv, Zaj Qeej Ntaus Suav) and grave construction, ancestral rituals (Npua Rooj), and even the Sudden Unexpected Nocturnal Death Syndrome (SUNDS) epidemic as a cosmopolitical protest.

Presenter(s): Jacob Hickman

Becoming the Dead: Hmong, Type 2 Diabetes, and Sovereignty

The cure for type 2 diabetes and the true return for Hmong Americans is "the Hmong shovel and the dirt." In diabetes groups, adult daycare, and interviews, older Hmong Americans with type 2 diabetes articulate themselves becoming the dead as both cure and return. Having left Laos after the America's Secret War, older Hmong Americans experience diabetes alongside their life in the US. In diabetes management, life is fostered through continuous monitoring of biological measures such as blood glucose, weight, blood pressure, diet, and exercise. However, older Hmong Americans find this chronic model unsatisfying, especially, as refugees who must live out life in the empire where they experience ongoing economic precarity, social isolation, and the undoing of

marital and familial relations. Drawing on scholarship on the dead, haunting, and critical refugee studies, this presentation argues that the refugee's future death is paradigmatic, revealing the chronic workings of US imperial violence in the empire. As well, the refugee's return is not a return to a place that is lost but to the refugee's own eternal sovereign power. Thus, older Hmong Americans' relationship to becoming the dead are how they are able and empowered to reimagine life as otherwise.

3372 Haunted Bodies, Healing Worlds: Ethics, Invisibility, and Moral Labor in East Asia

Start Date: 11/21/2025 10:15 AM **through** 11/21/2025 11:45 AM

Venue: Sheraton **Room:** Napoleon BR C1 (3rd fl)

Type: Oral Presentation Session

This panel explores how invisible forces-spiritual, affective, chemical, technological, and ethical-become entangled with the textures of everyday life in East Asia. The papers examine how people grapple with phenomena that cannot be easily seen or measured yet are acutely felt: moral uncertainty, ambient harm, spectral memory, and embodied distress. These forces linger in moments of transition-between life and death, illness and recovery, labor and automation, ecology and ritual-where boundaries between presence and absence are porous, and where ethical life is negotiated amid partial knowledge and indeterminate affect.

Rather than treating the invisible as a mere metaphor or mystery, this panel interrogates how it becomes materially and morally consequential. Invisible agents-whether toxins, ghosts, AI systems, or affective residues-generate demands for care, responsibility, and interpretation. They exert pressure on both the body and the conscience, reshaping how agency is imagined, suffering endured, and repair enacted. In this sense, the invisible is not simply something that escapes perception, but a force that is unequally distributed, misrecognized, or disavowed-by institutions, by scientific frameworks, and at times even by those who suffer its effects.

Anthropological accounts from across the region illustrate how such forces become socially and morally legible. In Taiwan, the uneasy silence of a donated body raises questions about familial agency and the ethics of posthumous care; in engagements with the environment, religious practices involving "eco-tea" articulate cosmological responses to ecological harm, while in another case, the invisible threat of pesticides looms large in the questionable metaphor of the ghost. In South Korea, AI-driven call center systems generate new forms of moral distress among female workers engaged in increasingly disembodied forms of labor. In Japan, recovery from eating disorders emerges as a moral and affective practice shaped by the enduring force of embodied trauma.

These papers examine how unseen forces become palpable in the bodies, practices, and moral worlds of those who must live with them. They raise critical questions about visibility, agency, and ethics: How do people make sense of suffering that eludes conventional diagnosis? What forms of care emerge when institutional frameworks fail to respond adequately? And what does it mean to act ethically when the sources of harm are obscured, intangible, or actively denied? In making the invisible legible, this panel calls for a deeper anthropological engagement with the subtle yet powerful forces that shape everyday life in contemporary East Asia.

Presentation(s): The Invisible Moral Career of a Dead Body: Familism, Emotions, and Ethics in Bodily Donations in Taiwan

Dead bodies are inherently social, in spite, and by virtue, of their embodied silence in liminality. In Taiwan, traditional Chinese funerals designate detailed ritual procedures for handling the remains of life. Bodily donations – either for organ transplants or medical education – run counter with the existing itineraries for the dead bodies. The liminality of the dead body perpetuates since, in Taiwan, the bereaved have the de facto final decision on bodily donations – with or without the donor's living written decision. This family's agency has led to differential results: an over-supplied whole-body donation for medical education and, as in most countries with an opt-in policy, a high discrepancy between diseased organ transplants and the number of people on the waiting list. My preliminary ethnography shows that the key lies in emotional ethics: Would the dead body suffer in the procedures and the afterlife? Is the suffering a good or bad death? What would the dead body become after the donation? In this paper, I will discuss the family's agency in expanding the capacity for changing the course of a lived life through a medical procedure on the dead body.

Presenter(s): C Julia Huang

Healing the Seen and Unseen: Nature-Based Shennong Myth and Ritual in Taipei

In the post-COVID era, environmental perception has gained renewed significance—not only as a mode of ecological awareness but also as a means of healing. The case of the Shennong belief practiced at Qingyun Temple in the mountains of Taipei exemplifies the green transformation of a traditional religious tradition. In response to escalating environmental degradation and the concurrent rise in disasters and diseases, followers of the temple have reconfigured their practices through the framework of divine revelation. This transformation is enacted through new discursive and embodied forms—for example, the ritual preparation of eco-tea, believed to carry sacred efficacy and serve as a therapeutic agent for healing humans, ecosystems, and wandering ghosts.

This paper examines the symbolic and ontological entanglements among environmental perception, religious reform, and spiritual healing, using Qingyun Temple as a case study. By attending to the worldview, moral practices, and reformative efforts embedded in this tradition, the study illustrates how cultural and ethical imaginaries inform modes of care for both the self and the environment.

The Invisible Threat of Pesticides: Ghostly Metaphors and Toxic Uncertainties in Taiwan

The metaphor of ghosts is commonly used to describe the danger of pesticides, for example in saying that consumers are haunted by pesticide risk. In some cases, the metaphor is apt and helps us describe the sense of foreboding among farmers and consumers. Like ghosts, pesticide toxins are invisible and can be dangerous. But the metaphor can be misleading because not all pesticides are equally toxic or toxic to humans, and the metaphor makes us think in binary terms (present vs absent), while with toxins, the dosage is critical to understanding the danger. Toxicologists are quick to dismiss the dangers of pesticides, if they are used correctly, and thus dismiss pesticide risk much like skeptics and materialists reject ghosts. And yet misuse of pesticides and excessive exposure to them is demonstrably dangerous. Does the ghost metaphor help us see and understand pesticides better, or is it more like an intellectual parlor game of anthropologists, detached from the reality of farmers and consumers? This paper examines how Taiwanese farmers and consumers deal with the uncertainty and invisible threat of pesticides, questioning recent anthropological use of the ghostly metaphor.

Presenter(s): Joseph Bosco

Breathless Labors under AI: Spectral Work and Techno-Moral Sickness in South Korea

In South Korea's AI-driven call center industry, labor has become spectral. For female agents, ghosts appear as hostile voices from past calls—memories that linger as residues of exhaustion and shame. They must speak warmly while remaining voiceless about their own pain, performing emotional labor as disembodied presences—present yet invisible. With the arrival of AI, this condition has worsened. Agents were first tasked with training AI meant to replace them, and now apologize for its failures. While AI lacks the "human touch," it creates new affective burdens: workers absorb customer anger while their own distress goes unseen. Rather than easing precarity, AI deepens it—eroding job security and accelerating workloads under algorithmic control. What is commodified now is not emotion but "goodness": moral endurance expected of those who must endure injustice with grace. I call this techno-moral sickness—embodied suffering produced by the intersection of ethics and automation. Call centers act as affective sewers, where social anxieties are dumped onto precarious workers. In Korea, breathlessness is more than overwork—it is a ghostly affect moving through labor, illness, and life.

Presenter(s): Kwanwook Kim

Loosening the Grip: Tracing “recovery” from Eating Disorders in Japan

In the throes of eating disorders—when food becomes intolerable or when bingeing sets in—it is as though an invisible, relentless force has taken hold. Are there any ways to break free from this force? If so, how?

Anthropologists have long depicted the haunting experience of eating disorders by attending to embodied practices and cultural logics that shape them. The experience is marked by a persistent entrapment in food and flesh, with past trauma echoing into the present, rendering mere existence unbearable. Yet, as survivors' accounts suggest, eating disorders can come to an end. What remains underexplored are the practices through which "recovery" is enacted.

In Japan, social scientific analyses of eating disorders have expanded since the 1980s, often adopting feminist or cultural lenses. By the late 2000s, however, social scientists began to acknowledge that "social determinants" were insufficient to address eating disorders. This prompted patients to value their own notion of "recovery" as a personal journey, distinct from the standardized biomedical model that focuses on symptom reduction. Yet, for patients on the brink of death, whose bodies are giving way, do these alone offer pathways to "recovery"?

To explore how "recovery" from eating disorders unfolds in practice, this paper draws on fieldwork in clinical settings and self-help groups in Japan. Ethnographic observations can trace how the invisible force of eating disorders loosens its grip—and why it matters

7727 Spectral Subjects: Conjuring Spirited Anthropologies

Start Date: 11/21/2025 10:15 AM **through** 11/21/2025 11:45 AM

Venue: Sheraton **Room:** Napoleon BR C2 (3rd fl)

Type: Roundtable/Town Hall

Spectral preoccupations are essential to human culture, and our propensity to cast them in material form is an impulse we can't resist. Anthropologists have long been drawn to reflect upon the materialities of the ineffable. The spectral subjects conjured by our ancestors reflect our relational subjectivities and phantasmic imaginings of human relevance. In ongoing reciprocities with sacred and spirited landscapes, we struggle to manage the indeterminacies of nature, climate, environment and multispecies kin. Ethnographers have long been the witnesses of uncanny agency, ghostly beings, objects, places and anticipatory sensibilities. In trying to make sense of spectral subjects, we have conjured spirited anthropologies. What monsters lurk in our ineffable entanglements? What shadowy presences weave through our visions of the past, present and future? As we summon the words, data, images, and energies that give body and fuel to cultural imagination, how do we ourselves enchant the world? This roundtable is a séance of intrepid mediums who invoke spectral subjects to consider the hauntings given shape through our disciplinary practice. We seek to explore personifications of the marketplace and spectral divinations of stock trading; ghosts that track in the mud of industrialization, environmental restoration, and contamination in the Midwest; large language models as necromantic

technologies haunted by the voices of non-consenting human subjects who provide training data; the phantasms of fossil fuels and dreams of renewable energy that power European imaginaries of the Anthropocene; the fate of earth-dwelling Klu and the afterlife of Tibetan ceremonial scarves; and the incantations of singing duets with ancestors in the hopes of language revitalization. New Orleans is a spirited place of memories, its real and fictional landscapes thronged with embodiments of the fantastic, from ghosts and vampires to Bacchus, Orpheus and Endymion. What better place to confabulate and contemplate the new, spirited Anthropologies we might bring into being?

7174 Debris of Futurity: Unfinished Makings of Our Pasts and Futures

Start Date: 11/21/2025 10:15 AM **through** 11/21/2025 11:45 AM

Venue: Sheraton **Room:** Napoleon BR C3 (3rd fl)

Type: Oral Presentation Session

Visions of the future are never only about what lies ahead, they are also shaped by what is left behind. In *Theses on the Philosophy of History* (1942), Walter Benjamin famously describes the angel of history as propelled into the future with their back turned toward the debris of the past, accumulating in a storm called progress. This panel invites papers that sit within that storm and ask: What does it mean to have a future? Drawing inspiration from the anthropology of futurity and historicity, we seek contributions that interrogate the costs, consequences, and configurations of "having" a future. How is the future imagined, constructed, or contested? What is left behind or rendered obsolete in the name of progress? What losses are folded into futures that appear inevitable, and what remains, resists, or emerges in their wake?

Presentation(s): Echoes of a Language: Mongolian language survival in China

On a scorching hot afternoon, in a community center in Inner Mongolia, China, twelve elderly people come together to learn Classical Mongolian. It was the language of their parents and grandparents, but one that they never had the chance to learn due to over seventy years of state-led

assimilationist agenda promoting Mandarin Chinese (Curdt-Christiansen and Gao 2021). One might imagine that they strive towards fluency or hope their dedication ignites a broader revitalization for future generations. However, I found that learning Mongolian in their case has shifted in meaning from mastery of the language to its use in performance (Bauman 1993) and as a performative act (Austin 1962). The elderlies focus their daily meetings on cultivating the feel of speaking Mongolian, through repeating basic phrases and singing Mongolian songs to tourists, without understanding most of the Mongolian they utter. What happens when an endangered language itself is not actively spoken yet otherwise lives on? In what forms beyond simple restoration to daily conversational use can language survival manifest? This project examines the future of a language by foregrounding survival, rather than revitalization, looking into the intersection between minority people's performative, symbolic engagements and the state's paradoxical stance.

Back to the future: nostalgia and futurity in rural China

Svetlana Boym writes that nostalgia is not about the longing for an imagined past, but a different imagined present. In this paper, I explore what happens if we think about this longing as the desire for a different future to an imagined past. In many ways, rural Chinese already live in the future imagined by Chinese leaders at the beginning of the Reform and Opening movement in the early 1980s. China is now a global superpower and a manufacturing powerhouse with the world's second largest economy. Large-scale urbanization projects have turned hundreds of millions of peasants into urbanites. My paper explores how, despite a shared sense of national progress, rural Chinese grapple with the ambivalence of living in a previously desired future that has drastically increased the temporal rhythms of daily life and that has stigmatized rurality as a sign of "backwardness." As rural Chinese become part of a new urban working class and lose their ability to control their own time, it is ownership of time, rather than material wealth, that becomes the focus of nostalgia and an object of desire.

Producing Futurity through the Here and Now: Group Speech in the People's Republic

This paper explores notions of futurity that emerge from encounters in Group Relations Conferences. First pioneered in post-WWII Britain before expanding to over twenty countries, GRCs in China today claim to offer paying participants the opportunity to explore the unconscious group dynamics that undergird everyday institutional life. In ritualized group events designed to evoke raw, phantasy-laden, often confrontational speech, everything from experiences of geopolitical tensions to intimate daydreams come to be spoken and made available for attendees to connect, critique, and reflect upon in group encounters. Drawing on Daniel Stern's phenomenological exploration of the "here and now" temporality of the psychoanalytic clinical encounter, this paper offers an interpretation of how conference staff and participants rely on a particular, shared experience of

the present to produce new notions of individual and collective futurity in these China-based conferences.

Presenter(s): Nick Bartlett

“They Can’t Come Back to Fix It”: The Posthumous Reverence for East Coast Graffiti Writers

I look at futurity in the context of death among east coast graffiti writers. I ask, what can we learn about futurity through the lens of mortality among NYC graffiti writers? Answers here are based in four years of ethnographic work with graffiti writers in New York City, urban New Jersey and Philadelphia. One emergent theme is the phenomenon of writers caring for the written names of dead writers that have been defaced, because, as they say, "Dead writers can't come back to fix it." This reverence offers connections to Anna Tsing's (2015) examination of survival in capitalist ruins. The care might be what Tsing calls the "arts of noticing," or the attentive practices that create meaning within erasure. While Tsing explores how matsutake foragers forge meaning in post-industrial forests, I analyze how graffiti communities preserve memory in urban spaces considered liminal, what graffiti writers call "cutty"; abandoned buildings or non-functioning train tunnels. I show how cleaning dead writers' graffiti names indexes a value system. It forms what Tsing calls an assemblage, a meaningful constellation of practices, materials, and relationships that create memory work within precarious conditions. These create continuity between the past and future of communities denied historical recognition beyond the label of pathology. The community's protection of these writings demonstrates how value and significance persist in spaces of erasure and impermanence; thus, futurity.

Water as way, water as labour: Fluidity and futuring among Hong Kong immigrants in Vancouver

"We are people in a borrowed city on borrowed time." This paper explores futurity through intergenerational narratives of Hong Kong immigrants in Vancouver, focusing on how they learn to and practice "be water" in navigating uncertain futures. Bruce Lee's "Be water, my friend" exhorts one to be formless, shapeless, and fluid, emerging in Hong Kong spheres as shared instruction, encouragement, and reflection. With the city as economic and ideological port, I examine migration as context where Hong Kong people use water as way to face barriers and borders, highlighting challenges to "flow" and resulting debris. How do Hong Kong people in Vancouver learn about and use "water" as way– of culturing and futuring– to make and articulate their lives? How do they respond to barriers they encounter? When is 'water' labour?

I find that love and family are important motivators for Hong Kong people migrating to Vancouver, where parents ai (endure) as one way to adapt and secure their children's future of tan (relax, enjoy). They face struggles to flow in everyday life, education, work, and relationships, evoking Biehl and Locke's (2017) anthropology of becoming and emphasis on human plasticity and constraints in making unfinished worlds. As water's mutability and diversity invites various interpretations (Helmreich, 2011), this paper shows how Hong Kong immigrants in Vancouver use water as way of futuring and considers the labour and costs of making with their pasts.

4148 Inhabiting Conditions of Violence: Seeing Anew through Cultural Horizons

Start Date: 11/21/2025 10:15 AM **through** 11/21/2025 11:45 AM

Venue: Sheraton **Room:** Napoleon BR D1 (3rd fl)

Type: Oral Presentation Session

What are the stakes of describing how one lives through deleterious conditions and structural violence? How might ethnographers see anew the difficult and creative work which sustains a life with others? This panel takes up these themes, among others, as some of the horizons of the discipline embodied in the SCA's 2024 Cultural Horizons prize-winning articles by David C. Thompson and Tarini Bedi. Thompson's article engages with key concepts in Black and Trans Studies to reckon with his interlocutors' movements "across rather than against a set of tensions shaped by slavery and incarceration" (2023, 52). Situating evasion within a broader genealogy of negotiating landscapes of captivity, Thompson's ethnography reverberates with echoes of the long history of Black fugitivity and focuses on how his interlocutors live with captivity, shifting what punishment "could and could not take" from them (49). Bedi's article introduces the concept of "sensate ecologies" to capture the often overlooked sensory and ecological dimensions of labor as drivers navigate through the ecological onslaught, or gadbad, of urban driving. By centering the perspective of urban drivers within a polluted ecology, Bedi urges us to pay attention to the different orientations, particularly the ethical and pragmatic ones, towards compromised ecologies.

The panel considers both articles' innovations to ask, concretely: how do these horizons take shape in the panelists' ethnographic projects? How do the descriptions and methods developed in these articles find resonance in our own work? Nomaan Hasan traces how a neighborhood dispute in the north Indian state of Uttar Pradesh activates competing claims to belonging. By shifting attention from the content of historical claims to the mode through which the past is inhabited, his paper offers a conceptual vocabulary for analyzing the politics of temporal form. Wan Yin Kimberly Fung's paper considers the afterlife of Japan's first major industrial pollution in the Ashio-Watarase River region, attending to the regenerative practices which embody in-betweenness: not an exit from toxicity but an inhabitation of ambivalence. Austin Bryan reflects upon the figure of the peer educator in Uganda's HIV response, specifically tracing how, through the labor of peer educators, a political and ethical horizon emerges where the work of care is inseparable from the struggle to survive. Marios Falaris' paper traces how unemployed young men tarry with the lethal everyday of militarization in Indian-occupied Kashmir, ultimately describing how young men invest the everyday with pleasure, fantasy and possibility. Engaging with the "cultural horizons" in Thompson and Bedi's articles, this panel thus takes up a range of methods for detecting the effects of violence, not only as spectral presences, but as intimately bound up with our interlocutors' efforts at making a life livable.

Presentation(s): The Politics of Temporal Form: An Ethnography of a Neighborhood Dispute in India

While scholars have long described how the past is mobilized for political legitimacy, this paper argues that the normative force of such claims derives not only from historical content but from the temporal forms through which the past is apprehended. Drawing on ethnographic fieldwork in the north Indian state of Uttar Pradesh, I examine how a neighborhood dispute that erupts into Hindu nationalist violence activates competing claims to belonging. Majoritarian discourse leverages a temporal form predominant in both political and academic discourse, which is governed by the norm of priority wherein legitimacy is secured through chronological precedence. In contrast, residents articulate an alternative temporal imagination in response to the violence enacted in the name of priority. To characterize this, I develop the analytic of density—a temporal form grounded not in origin but in the sedimentation of shared life and continuous entwinement. By shifting attention from the content of historical claims to the mode through which the past is inhabited, this paper offers a conceptual vocabulary for analyzing the politics of temporal form. In doing so, it furthers reflection on the chronopolitics of anthropological theory, illuminating how its temporal forms capacitate and constrain relational possibilities.

What Cannot Be Unearthed: Edges of Recovery and Surfaces of Action

This paper engages with the century-and-a-half afterlife of Japan's first major industrial pollution in the Ashio-Watarase River region. Over time, sedimentation has caused mining residues to settle into the river's chemical infrastructures (Murphy 2013), from dams to riverbeds. The surfaces above these heavy-metal layers have been declared restored: sites of agriculture, livelihood, and wilderness. These surfaces bracket the violence of past dispossession and buried threats while also bearing uncertain leakage of toxins through rainfall, seismic shifts, and decaying infrastructure. They are part of the region's public secret (Taussig 1999), yet what cannot be unearthed is not an erasure of harm but surfaces that communities have acted upon and reshaped into edges of possibility. I ask: what kinds of ethnographic attention allow us to stay with instability, not to redeem it, but to trace how different futures emerge in late industrialism (Fortun 2014; Ahmann & Kenner 2020)? For instance, reeds grown in the wetland, which is also a reservoir built through eviction and layered with toxic residues, are harvested and returned as compost to Ashio's mountains, reversing the flow of pollution. These regenerative practices do not resolve the tension between Ashio and downstream areas affected by the mining legacy and corporate impunity, but render the sedimented surfaces actionable. They embody in-betweenness: not an exit from toxicity but an inhabitation of ambivalence.

The Peer: Community Health Workers and the Underclass of Global Health

This paper explores the figure of the "peer educator", locally called "peers", in Uganda's HIV response as both an agent of care and an embodiment of global structural abandonment. Recruited from the very communities targeted by donor interventions, such as LGBTQ+ Ugandans, sex workers, and people living with HIV, peer educators are positioned as the face of "community-led" and "community-owned" global health. Yet beneath this framing lies a deeply extractive labor regime. Peers perform counseling, contact tracing, and adherence monitoring, often without contracts, protections, or recognition. Drawing on ethnographic fieldwork with peer educators in Jinja, Uganda and NGO directors and donor agencies in Kampala who debate and broker their stipends, this paper traces how peers become symbols of empowerment, nodes of containment, and extensions of a global health system that relies on their proximity to risk but denies them structural stability. Peers are praised for their resilience even as they navigate burnout, community mistrust, state surveillance, and arrest. Situating this analysis within a broader critique of racial capitalism and humanitarian governance, the paper argues that containment in what I described as "global medical apartheid logic" is not only spatial or epidemiological but deeply labor-based. In tracing their labor, this paper reflects on what kind of political and ethical horizon emerges when the work of care is inseparable from the struggle to survive.

Presenter(s): Austin Bryan

Inhabiting Suspicion and Fantasy: Masculinity and the Everyday in Indian-Occupied Kashmir

This paper starts by considering how Kashmiri masculinity is shadowed by the figure of the militant, and thus young men in Kashmir must contend with an everyday suffused with suspicion. I track how state-led development initiatives, intended to curb high unemployment in Kashmir, reproduce these lethal suspicions for young men. Any number of mundane activities they engage in, which had previously been unremarkable, may suddenly come under suspicion through shifting surveillance mechanisms. I then describe how young men navigate such a militarized everyday, and come to make it livable for themselves. Specifically, through their investments in ephemeral forms of masculine intimacy—on the road, watching the match, at the shop ledge—young men re-worked their sense of the everyday as an everyday that was pleasurable, fantastical, and in which they could sense possibility. These possibilities were not necessarily tied to a clear future, but rather, their significance was registered through the ways that they altered the very texture of the everyday, where young men could more readily detect a kind of hope in the present moment.

2509 Viability: Love, death, and animal afterlives

Start Date: 11/21/2025 10:15 AM **through** 11/21/2025 11:45 AM

Venue: Sheraton **Room:** Napoleon BR D2 (3rd fl)

Type: Oral Presentation Session

In 2008, Donna Haraway reminded us that it is a "misstep to pretend to live outside killing". For to do so, she suggested, would be to forget "the ecologies of all mortal beings, who live in and through the use of one another's bodies" (2008: 79). In one sense, of course, this is a truism. To the extent that human beings need to sustain themselves, how could we ever avoid violating other lives altogether? For Haraway, though, this simple intuition served as an invitation to think about the ethical, political, and material processes by which certain living beings become violable and even killable in certain times and places. And by which others do not. Indeed, for Haraway, the problem is to learn to live responsibly "within the multiplicitous necessity and labor of killing"

From early accounts of sacrifice to contemporary studies of leisure hunting, animal experimentation, and industrial meat production, deaths of animals sit uneasily on us and require elaborate reasoning and calculation to negotiate the weight of their death. As Govindrajana (2018) has described, this burden may be shouldered through daily acts of care that deepen the cost of the sacrifice, making the life of the animal grievable. Indeed, it is grievability that Cary Wolfe (2019), drawing on Judith Butler (2004), identifies as a vital way to make animal deaths count where vulnerability is not simply a recognition of fragility, but involves a becoming vulnerable together (Despret 2016). This contextualizes, indeed nuances the politics of bearing witness pioneered by animal rights organizations that seek to counter the 'deanimalization' of the animal (Vialles 2005; Lockwood 2018). Thus, whilst we may indeed always live at the cost of another's life, such inevitability does not mean that death ceases to matter (Singh & Dave 2015). Such deaths may indeed continue to haunt us, and the questions remain as to what it might look, feel, and taste like to live and work off others with openness to the ongoing (in)calculability of the associated such ethical dilemmas.

The panel invites papers that tend ethnographically to ways in which, the places in which, and the moods through which animal killing transpires – the inevitabilities, vulnerabilities, and violences of deaths and their afterlives. In thinking with killing and loving animals and the awkward flourishings of multispecies ecologies (Chao 2021; Ginn, Beisel, & Barua 2014), we examine the everyday ethics that emerge when certain species meet and vitally move towards what comes after the entanglement of companion species and what a multi-species anthropology of indifference might involve (Giraud 2019; Dave 2024).

Presentation(s): Death of a Manatee: The Forensics of Ecotourism in the Dominican Republic

It was tourism – the darling of the Ministry of Environment – that killed the manatee – the other darling of the Ministry of Environment. In the hotly contested, warming waters of the northern coast of the Dominican Republic, manatees graze on the seagrass along the shallow coastline, their

backs barely submerged in the water. Once a quiet fishing town, one coastal outpost has experienced a boom in (eco)tourism in the last decade, where attention to the marine environment has played a central role in drawing visitors to this place. Increases in boat and jet ski traffic pose dangers to the region's longstanding diver fishermen, but also to the charismatic fauna – such as the manatee – that are cited as one of the ecological treasures of the region. This paper explores the obscured and contested accidental killing of one manatee, which occurred at the crosscurrents of state relations with the nation's seascapes. Tourism, marine conservation, and the institutional entanglements between them posed problems for reckoning with the manatee's death in what I term the forensics of ecotourism. This paper examines narratives of charismatic species and inconvenient evidence of a killing to explore how conservation's optics of love can obscure environmental crimes in the name of ecotourism.

Presenter(s): Kyrstin Mallon Andrews

Killing them softly: ethics and apologies in lethal biologist practices

This presentation focuses on the kinds of human-animal relations that emerge from various forms of violent enterprises within biology practice, both inside and outside laboratories. Over the course of long-term fieldwork among biodiversity-oriented biologists, I witnessed and participated in lethal encounters with everything from beetles to sharks. Again and again. And I remain puzzled about how interlocutors reacted to and went about all this death-dealing. How is it that a group of self-professed lovers of life comes to exercise or subscribe to all this suffering? The talk exhibits how biologists, as they do so, try on various mitigating or legitimizing logics, such as de-animalization and sacrifice, but also that such frameworks fail to assuage fully the ethics involved in these lethal encounters. Indeed, the presentation shows how the ethical potential of ants and hagfish, sea squirts and frogs, despite clear asymmetries in terms of power and autonomy, is not so easily domesticated. It is argued, ultimately, that violence executed by biologists is realized in an ethically ambiguous yet deeply engaged mode of apology whereby perpetrators accede to the complexity of entangled multispecies relationships and take on responsibility for their actions in order to nurture the care-full potentials of responsivity.

Everyday Eradication: Conundrums of Killing, Combating Mosquito-borne Dis-ease, and Building a 'City in Nature' in Singapore

The day-to-day labour of eradicating mosquitos is commonly presented as apolitical and morally irreproachable. Indeed, it's hard to take issue with efforts that potentially save hundreds of thousands of lives worldwide each year. In Singapore, dramatically transforming the landscape, through smothering mangroves in concrete and saturating the city in insecticides, this island nation was official declared malaria free in the 1980s. Likewise, the daily work (known as vector control or 'housekeeping') to keep the jungle at bay and destroying all bodies of stagnant water that may harbour mosquito larvae, has kept the transmission of diseases low compared to neighbouring states. In the process, however, vector control has perpetuated large-scale habitat destruction, and

the extinction of untold numbers of native species: trapping this island nation in seemingly endless cycles of habitat destruction, extinction, and disease outbreaks. This conundrum becomes particularly apparent in the Singaporean Government's ongoing efforts to transform this island nation into a 'City in Nature', restoring its ecosystems and bolstering its biodiversity. In this paper I focus on ordinary places around Singapore, examining the ambiguous affects and effects of eradication, and explore local attempts to overcome them.

Presenter(s): Tomas Cole

'I don't like it, but I have to do it': Existential apologies, affective injustice, and the everyday ethics of killing in industrial pig farming

27,000 piglets die prematurely every day on Danish pig farms, a result of the industrialization of porcine bodies being pushed to their limits within an intensive system, and Aleksandra apologizes as she kills one more. A pig with a bad leg cannot stand, so must be shot, and Daniel apologizes for the act. 'My best friend', the six-month-old '24', is being sent to slaughter, and Andreas offers no apology for the death that is to come. What are these apologies doing? Are they simply speech acts? Are they attempts to save face, in the Goffman sense, in a social situation where everyday acts may be exposed to scrutiny? Or might killing the Other in the presence of another operate as an existential prompt that provokes an apology (or not) revealing an existential equivocation as well as an irresolvable 'affective injustice'? I have my doubts and so did they.

This presentation considers how industrial agriculture imposes profoundly difficult normative conflicts on marginalized individuals forcing them into doing things they don't want to but feel they must. Through this perspective, the apology is anaesthetized by the inevitability and necessity of killing itself and is symptomatic of unrecognized injustice rather than a gesture towards forgiveness.

5649 Diagrams in anthropology: haunting the canon? Exploring critiques and possibilities of diagrammatic work.

Start Date: 11/21/2025 10:15 AM **through** 11/21/2025 11:45 AM

Venue: Sheraton **Room:** Napoleon BR D3 (3rd fl)

Type: Roundtable/Town Hall

Diagrams appeared in some of the earliest works of anthropology and are still frequently used across the discipline today. This persistence alone warrants attention, especially since certain diagrammatic forms have remained largely unchanged over many decades. Given this longevity, studying diagrams is a way to engage with the disciplinary history of anthropology itself, as in the recent book "Burning Diagrams in Anthropology" (punctum 2024). While other visual components

of anthropological work – especially photography, cartography, and film – have been subject to significant critical scrutiny, diagrams have received far less reflexive attention. What are the ethical, political, or epistemological implications of these gaps? What have been – and what might be – the roles that diagrams perform in anthropological work, e.g. the diagram as method, as representational technique, as conceptual tool? This Roundtable conversation will explore how practitioners across diverse fields enliven, enact, extend, and inhabit diagrammatic work – pointing towards potential futures for (re)visualizing relational, conceptual, and social worlds.

7003 Smoke Signals: Fire, Air, and Atmospheres of Pollution

Start Date: 11/21/2025 10:15 AM **through** 11/21/2025 11:45 AM

Venue: Sheraton **Room:** Nottoway (4th fl)

Type: Oral Presentation Session

This panel explores the anthropology of air through the lens of smoke-its production, perception, and politicization. As wildfires, waste incineration, and domestic practices release visible and invisible pollutants, smoke emerges as a physical and symbolic entity that influences sensory environments and regulatory systems. From the fire-affected wildland-urban borders of Colorado and the Pacific Northwest to the ritualistic and recreational use of incense and wood burners in London, presenters explore how smoke is understood, contested, and managed. In Northern Thailand, the seasonal agricultural burning creates haze that is addressed through local traditions, spirits, and mobile apps, while in Bulgaria, racialized blame for smoke production highlights the political use of air quality data. Across these locations, smoke signals intersect with regulatory frameworks, environmental risk, and moral evaluation. Presenters trace how people interact with smoke as it moves into, through, and out of homes-as a danger, a tradition, or a means of livelihood-amid disputed evidence and uneven responsibility. Papers explore how bodies act as sensors, how wildland fire managers, restoration industries and government entities define contamination, and how air becomes a platform for discussing racial, economic, and environmental justice. By viewing smoke as a symbolic and affective medium, this panel positions the anthropology of atmospheric pollution as a crucial area for theorizing environmental justice and the perceptual politics of environmental degradation in a smoke-filled world.

Presentation(s): Cultures of Combustion: Wood Burners, Incense, and Air Pollution in London

This paper contrasts two forms of domestic combustion in London: wood burners and incense. Drawing on a year's ethnographic research in the UK, I explore the political and cultural dimensions of these burning practices that both produce particulate matter, a major air pollutant concern. Wood burners, used primarily for ambience rather than heating, are relatively common in middle and upper class households, and are the focus of air quality activists' ire for the particulate matter they release outdoors. Incense, typically heated over burning coals and used to scent the home, is common in North and East African communities in London, and the focus of public health experts' concern for the particulate matter it releases indoors. Looking at these two practices together offers an insight into cultures of combustion and the affective and material atmospheres produced through burning in the home. I examine the role that smells – perceived by some to be pleasurable and by others to be toxic – play in both the continuance of these practices and opposition to them. I consider the contrasting interpretations of these practices as polluting and harmful versus cleansing and comforting and what this means for experts' efforts to intervene. Through this analysis, I highlight the varied political alliances, toxic entanglements, and social worlds generated in and through domestic smoke.

Presenter(s): Jessica Barnes

Smoke Signals: Semiotic Ecologies and Fire Politics in Northern Thailand

This presentation explores Chiang Mai's seasonal haze crisis through a semiotic and phenomenological lens, drawing on an ethnographic analysis of smoke and fire conceptualizations. Instead of framing air quality solely through scientific data, I contend that smoke and fire are intricately woven into the cosmologies, livelihoods, and power dynamics of Northern Thailand. From official bans and mobile apps to traditional proverbs and forest spirits, I reveal how local categories mediate experiences of smoke and its contaminating properties. Terms such as ching pao (early burning), fay arom (emotional fires), and kleng pao (slandorous fires) encode competing narratives about ecological knowledge, authority, and control. Grounded in STS, political ecology, and phenomenological anthropology, this work traces how haze becomes a contested atmospheric condition—measurable through PM2.5 monitors, sensed through smell and sight, and interpreted through deeply situated cultural frameworks. In doing so, it highlights the ontological entanglement of breathing, environment, and governance. This paper reveals that Chiang Mai's smoky season is not merely a public health issue but a political and semiotic landscape where notions of pollution, purification, and propriety are continually redefined.

Presenter(s): Mary Mostafanezhad

Smoke, Pollution, and the Racial Politics of Evidence-Making in Urban Bulgaria

Sofia, Bulgaria is among the top 25 most polluted cities in the world according to the Air Quality Index (AQI). In 2023, the city's average PM2.5 levels were 2.6 times higher than the WHO's annual air quality guideline. Within Sofia, Romani communities—one of the country's largest and most marginalized minority groups—experience disproportionately polluted air and related health issues. Yet, instead of addressing systemic sources such as industrial production and car emissions, populist narratives blame Romani neighborhoods for the city's poor air quality. Rather than acknowledging the impact of urban air pollution on Romani communities, political campaigns falsely attribute the city's degraded air quality to the everyday practices of Roma residents, particularly the burning of waste for heat. This presentation analyzes how evidence of air pollution is made, contested, and racialized in Bulgaria. I argue that smoke is not only a material index of polluted air but also a tool through which political actors weaponize air-quality data for right-wing agendas.

“My daughter is my canary”: Smoke Contamination, Sensory Expertise, and the Ambiguous Semiotics of Toxicity

Air seems immaterial, until it isn't. The increasing prevalence of wildland-urban interface fires, like the 2021 Boulder County Marshall Fire, has prompted new ways of knowing the air, including how chemical products of fire transform homes and bodies into ambiguous repositories of toxicity. This presentation draws on an emergent archive, the Louisville Historical Museum's Marshall Fire Story Project, as well as textual analysis of new smoke restoration guidelines and interviews with policy makers and people affected by smoke contamination. Individual bodies are not understood as equally reliable witnesses to contamination: the most sensitive are the "canaries" whose physical manifestations index invisible capacities for harm. The effects of smoke contamination are knowable though diverse bodily symptoms and chemical analysis, where these epistemes produce zones of uncertainty for residents and scientists alike, even as they offer opportunities for industry expansion by restoration and insurance companies. Here, we focus on the semiotics of toxicity within contested fields of expertise: how restoration guidelines regiment interpretations of the qualia of smoke contamination, which linger as ghostly traces; how people's bodies act as variously attuned sensors for contamination; and the affective ways toxicity might be understood, through the embodied experience of inhabiting a space and the anticipatory logics of public health or biomedical frameworks of future health risk.

How Smoke Travels

This paper discusses how wildfire smoke travels as a concept, from the birth of the measurement techniques used to determine the amount of PM2.5 (particulate matter less than 2.5 microns in diameter) in the air to the feeling of being in a forest as the air fills up with the smell and soupiness of chainsaws whirring, fir trees coming down and biomass burning. Based on fieldwork in the U.S.

Pacific Northwest, including work as a wildland firefighter on suppression and prescribed fire assignments, and interviews with fire managers, wildland firefighters, and scientists, this paper articulates three critical questions for wildfire smoke, asking what the measurement of smoke hides and reveals, how and why regulatory frameworks create different levels of pollution that are deemed acceptable for different people, and what fire managers want to know about wildfire smoke. Analyzing how regulators engage with thresholds for wildfire smoke (Liboiron 2021), who counts as an appropriate group for the state to protect from smoke and why (Nelson 2015), and how fire managers work to weave trust with the public through publishing air pollution numbers (Porter 1995), the result of this analysis offers ways to think about wildfire smoke that are relational, blending qualitative and quantitative data, including ethnographic experience (Roberts 2021). It also offers ways to understand how current regulatory and social frameworks produce high levels of exposure for frontline workers.

3335 Sovereign Futures: Uneven Geographies of Postcolonial Financial Regimes

Start Date: 11/21/2025 10:15 AM **through** 11/21/2025 11:45 AM

Venue: Sheraton **Room:** Rhythms I (2nd fl)

Type: Oral Presentation Session

Anthropologists have long traced how postcolonial states have served as sites of economic exploitation, experimentation, and speculation (Appel 2019; Chalfin 2010; Elyachar 2005; Ferguson 1990; Rabie 2021). This panel explores these concerns through regimes of finance in Africa, the Middle East, and the Caribbean where postcolonial states and international financial actors are reorganizing sovereign debt and jurisdiction to generate new forms of value and extraction. Specifically, this panel examines tax havens, bond markets, and special economic zones, which host a range of financial activities, from tax avoidance and wage evasion to debt-swaps and speculation on emerging markets.

Tax havens emerged with the post-WWII reorganization of economic relations between empires and former colonies (Ogle 2017). Yet monetary practices central to offshore finance can be traced back to extractive economies at the turn of the 19th century when multinational companies with mining operations in South Africa were legally ruled to have corporate residence in London. These colonial-era financial practices were predecessors of today's tax havens, which continue to shield mining companies from taxation and deprive African states of revenue.

While special economic zones have proliferated worldwide since the 1980s, in recent years they have mutated in ways that pose new challenges to state sovereignty. As tech entrepreneurs in crypto and biotech exit the U.S. and Europe in search of "friendlier" jurisdictions, a growing number of countries are scrambling to host them by pursuing a path of radical deregulation. Honduras has

paved the way, launching the first semi-autonomous zone on the Caribbean island of Roatán, where foreign companies can design their own laws and self-govern.

Emerging bond markets and debt swaps are instruments issued by countries to finance their development or in the case of Lebanon reduce its sovereign debt. Emerging markets have become sites of power struggles between China and Western lending institutions as China claims the title of the world's largest investor in emerging markets. Simultaneously, new forms of racial capitalism in the Chinese century use the surplus produced by African labour and resources through a development-underdevelopment dialectic characterizing Sino-Africa relations (Huang 2024).

The regimes of finance explored in this panel raise new legal and ethical questions regarding corporate rights and sovereignty. What rights and obligations do foreign investors and host states have to each other? How do international regimes enforce these obligations? How do indebted states assert agency in the face of fiscal discipline? The study of these places and their legal-financial configurations begs for a rethinking of postcolonial statehood and racial capitalism against the backdrop of a global backlash against democracy and escalating Sino-U.S. rivalries over geopolitical influence in emerging market countries.

Discussant: Gustav Kalm , Mingwei Huang, Dartmouth College

Presentation(s): Regulating the Future: Legal Experimentation in Honduran Semi-Autonomous Special Economic Zones

In 2013, government officials in Honduras created a new type of special economic zone that allowed foreign and domestic companies to self-govern within a designated area. They hoped the zones would attract new types of foreign direct investment and high-tech industries to propel Honduras beyond the maquiladora (duty-free factory) sector where it had been floundering since the 1980s. Based on ethnographic research, this paper examines Próspera, Honduras's (and the world's) first semi-autonomous zone, which broke ground in 2019 on the island of Roatán. Started by a group of U.S. investors, Próspera explicitly aims to transform Roatán into a "Hong Kong of the Caribbean" for Web3 technology, cryptofinance, and biotech. They position Próspera as a sandbox for piloting the governing structures, laws, and regulations for these emergent industries. As entrepreneurs and venture capitalists increasingly turn their attention towards decentralized financial and legal technologies, how do they understand the sovereignty and the state? What are the stakes of their experiments beyond Honduras as libertarian technologists in the U.S. seek to remake governance from within? Through examining the activities and ideologies of the investors, lawyers, and entrepreneurs building Próspera, this paper traces the intellectual genealogies informing their designs, as well as how their visions and ideals come into confrontation with the social, environmental, and infrastructural realities of Honduras.

Ordering International Taxation Through Wage Evasion: South African Mining and the Advent of Offshore Finance

Regimes of extraction in Southern Africa have often been located within the circuits of migrant labour economies with little regard for the global flows of capital they are embedded in. Similarly, global histories of financialisation in the late 19th century seldom connect the extractive regimes of mining in Southern Africa with the advent of specialised financial practices that came to characterise offshore financial centres and modern tax havens. In this paper, I use a case deliberated between the British Exchequer and De Beers Consolidated Mines in 1901 to locate wage evasion as an analytic concept that was anticipated in a seminal decision of corporate residence in international taxation. De Beers was registered in the Cape Colony in 1888 with head offices in Kimberley where it ran operations. The company also had an office in London chaired by Cecil Rhodes and a board of directors. The ruling that "real control" of the company was executed from London anticipated contemporary uses of modern tax havens. For South African trade union officials, shop stewards, and civil society activists, the use of offshore financial centres is wage evasion because the base for paying living wages to workers is eroded. By tracing the colonial era regime of monetary and exchange controls, I locate the advent of Southern African mining with the modern formation of offshore finance.

Presenter(s): Simon Rakei

Moral Economies of Obligation and Power: Debt, Transparency, and the Struggle for Mozambique

The imposition of conditionalities and liabilities on sovereign governments in exchange for multilateral or private debt financing raises major questions in the political economy of indebted states. The anthropological literature on "moral economies" offers a rich lens for analyzing how notions of improvement, responsibility, and "good" governance animate and justify programs of fiscal discipline. This paper takes up the case of Mozambique's oscillating relationships with IMF and Chinese state creditors after the 2016 "tuna bond scandal," when \$2.2 billion of undisclosed government guarantees to private European banks came to light, leading to the withdrawal of IMF support. Examining Euro-American investor discourses on the debacle, drawn from public reports and data collected during fieldwork with an investor group in 2022, I show how transparency and disclosure conditions associated with the IMF and Western capital markets are contrasted with "hidden" liabilities attached to Chinese lending through the Belt and Road Initiative. The analysis reveals how normative assumptions in liberal governmentality disavow and displace the exercise of power onto the Chinese other while negating the material benefits and terms that make Chinese credit attractive. I conclude that moral discourses must be read in tandem with political economy to understand the agency of developing countries navigating competing regimes of imperial investment and control.

Building a Future by Trading the Past?: Debt-Swaps and Reconstruction in Lebanon

Since Lebanon's sovereign debt prompted an economic collapse in 2019, the country has been beset by compounding problems. Questions of recovery have a new urgency, however, after nearly 14 months of warfare, which has caused over \$14 billion in damages and left tens of thousands homeless. Now, Lebanon's new government has promised that reconstruction is a top priority, but it is unclear where the financing for such an undertaking will come from. However, a novel form of financial instruments, known as debt-swaps, has been offered by international stakeholders as a solution. Debt-swaps, or bilateral agreements where creditors buy-back sovereign debt in exchange for commitments to environmental protection, were first piloted in Central and South America for conservation. These early successes have prompted the IMF and other stakeholders to explore applying debt-swaps to sectors beyond climate mitigation, including infrastructure development. In the context of Lebanon's financial history, shaped by colonial ties with France and regional relationships with Gulf-based banks, what are the political consequences of debt-swaps in post-conflict environments? Through ethnographic research with development bankers and NGOs in Beirut, I will show the novel forms of transnational obligation that debt-swaps are weaving into processes of reconstruction.

8161 Immaterial Entanglements and Spectral Presences in Agrarian Transformations

Start Date: 11/21/2025 10:15 AM **through** 11/21/2025 11:45 AM

Venue: Sheraton **Room:** Rhythms II (2nd fl)

Type: Oral Presentation Session

Whereas the research on agrarian transformations has largely focused on material shifts in rural livelihoods, agrarian societies invoke immaterial agents and spectral presences when making sense of the precarities of change. This panel explores how the immaterial dimensions of agrarian transformations are entangled with shifting global markets and state forces. We examine how absences in the agrarian landscape are felt alongside what is materially present, be it the current absence of past entities like mangrove forests, maize fields, or a holy blessing, or the unrealized futures evoked by an abandoned power plant or a state intervention. We attend to these past losses and future uncertainties as specters that haunt each of our field sites and animate our interlocutors' responses to change.

This panel asks: What can we learn from the immaterial entanglements of agrarian transformation? By examining the spectral presences of agrarian life, we aim to reveal the more-than-material (and indeed more-than-human and more-than-secular) relations through which marginalized agrarian communities respond to the precarities of change:

In northern Mexico, metaphors of the monstrous serpent Sinowi reveal how Rarámuri and Mestizo communities navigate a national program that seeks to redefine rural life while striving to sustain their own life projects. In Eastern India, the half-constructed site of a thermal powerplant – a sign of

a future replete with employment opportunities and social mobility – never came to fruition due to the changing energy transition policies and left the community haunted by the ghosts of a future that now seems out of reach. In Chanthaburi, Thailand, the creation of a state-sponsored ecotourism site has successfully showcased sustainable shrimp farming but has also transformed the surrounding shrimp farms into living museums, where traces of past livelihoods linger and farmers navigate the uneasy shift from independent cultivators to curated participants in a state-managed vision of rural sustainability. In Morocco where a blight devastating heritage cactus varieties has forced peasants to reconsider the role of remote and unseen forces as agents of agrarian change. In the Cuchumatán highlands of Guatemala, Mam Mayan smugglers ascend sacred mountaintops with their clients to intercede for the precarious migration journey to the US, with the outcome of smuggler-mediated migration determining whether Mam households choose to continue cultivating maize fields or transition their fields to wood lots. Drawing on ethnographic research, this panel highlights how spectral absence and immaterial forces not only shape the agrarian landscapes but also offer critical insights into how rural communities imagine the uncertainties of transformation.

Presentation(s): The Return of Sinowi: Ghosts of rural decline and post-neoliberal futures in the Sierra Tarahumara of Mexico

In 2015, the inauguration of a road in Norogachi—part of broader state efforts to integrate the Sierra Tarahumara of northern Mexico into neoliberal frameworks—sparked alarm among the Indigenous Rarámuri, especially elders who warned of the return of Sinowi, a mythical serpent said to devour children. In 2019, Sowing Life, a self-proclaimed anti-neoliberal program aimed at transforming rural life by addressing poverty and environmental degradation, provoked a similarly uneasy response. If these initiatives reflect opposing visions of state intervention in the Sierra Tarahumara, why did they elicit such comparable reactions? This article argues that these responses are best understood by examining how institutional interventions reshape not only the material landscape, but also the collective interpretations of the past and future embedded in Rarámuri and Mestizo life projects. Drawing on extensive ethnographic research in the Sierra Tarahumara, the article explores local responses to the specters of agrarian transformation as state initiatives attempt to reimagine rural futures.

Presenter(s): Elias Plata Espino

Becoming a Living Museum: Thai State Curated Sustainability and the Constrained Futures of Shrimp Farmers

The shrimp farming boom in Thailand during the late 20th century led to the widespread clear-cutting of mangrove forests to make way for aquaculture. In response, the Thai state established the Kung Kraben Bay Development Study Center in 1981 as part of the Royal Development Project, reimagining the area as a site of environmental restoration and community-based economic activity. This paper explores the immaterial dimensions of agrarian transformation in Chanthaburi, where state-led ecotourism and environmental policy have reshaped shrimp farming into a curated model of sustainability. Drawing on ethnographic fieldwork, the paper examines how shrimp farmers are positioned within narratives of human-nature harmony, staged for touristic consumption and global recognition. While upheld as sustainable examples, the farmers exist as a "living museum" — bound by regulatory constraints that prevent intensification and obstruct the futures they imagine for themselves. Beneath the bay lies the spectral memory of mangrove forests once destroyed for shrimp ponds. This paper examines how these haunted landscapes reveal how state narratives and environmental ideals can simultaneously preserve ecosystems and foreclose rural futures.

Presenter(s): Brianna Porter

Living in the shadows: Reconciling development dreams with the energy transition goals in rural Eastern India

In rural agrarian India, socioeconomic transformations have long been driven by historical aspirations for development through secure job opportunities. However, these visions of progress now appear disrupted by the arrival of energy transition policies, as the Indian state tries to straddle its goals of development and climate crises mitigation. This shift has led rural folks to reimagine their future. Drawing from ethnographic research in rural Eastern India, this paper highlights how the coproduction of development and energy transition has led many to find new ways to get by without abandoning their dreams of social mobility. The village of Srikhanda was to host a thermal powerplant, which sparked hopes of progress. But the project never came to fruition due to evolving thermal power phasedown policies, leaving the community in a state of uncertainty. Haunted by the loss of a promised future, many migrated to cities in search of waged labor, while others turned to the precarious livelihood of driving totos—popular three-wheeler electric vehicles providing local taxi-services. Although the villagers rarely spoke of the powerplant directly, their visions of the future and everyday practices remained shaped by the imagined futures the incomplete project evoked. Living in the shadows of the now-abandoned site, the community continues to grapple with the ghosts of a future that seems increasingly out of reach, even as debates around energy transition and development persist.

Presenter(s): Nikita Das

Geographies of the Blessed and Dispossessed: Moroccan cacti-culture and the unseen

Moroccans once regarded the Province of Sidi Ifni in Southwest Morocco as the Kingdom's Cactus Capital. While the intensive scaling of prickly pear cactus fruit production was a relatively recent result of the 2008 Green Morocco Plan, residents regarded the region's unique suitability for cactus fruit production as a product of divine favor. While the coastal humidity and the purported richness of the soil were both blessings contributing to this region's rare distinction, the cactus was a uniquely holy gift, one brought from overseas. Yet, in 2017, this gift was revoked by the arrival of a novel pest known as cochineal, which in four years has completely transformed the Moroccan landscape – leaving emptied villages and reducing the once iconic cactus hedges that lined the countryside to wilting heaps. This precipitous loss in the region's sole source of rural livelihood has forced agriculturalists to consider the many possible unseen forces at play in reversing their fortunes, be it the will of God or the working of elite conspirators and spirits. Looking toward the future, they ask, will the new cactus varieties bred in government labs possess the same divine exuberance as heritage varieties? Based on 12 months of ethnographic research, Lloyd's paper seeks insight into how shifting local understandings of environmental processes, which exceed secular notions of material causality, respond to perturbations and condition possible environmental futures in Morocco.

Presenter(s): Lloyd Farley

Smugglers, Swidden, and Sacred Mountains: Mam Mayan coyotes as more-than-human mediators

For the Mam Mayans of Guatemala's Cuchumatán highlands, seasonal migration to coffee plantations has, in recent decades, been superseded by transnational migration to the United States. To make the perilous journey across Mexico, Mam Mayans rely on local smugglers, called coyotes. This paper explores the relationship between smuggling and transformations in the landscape of the Cuchumatán highlands, in which maize fields have been increasingly transitioned to alder and pine wood lots. My research shows that the current dominance of wood lots in the swidden cycle is an agroecological response to the high-stakes gamble of smuggler-mediated migration in which coyotes must navigate the ever-changing illicit networks of police, gang, and cartel checkpoints across Mexico. To handle the risks of migration, coyotes and their clients ascend sacred mountains to intercede for the outcome of their future journey. Coyotes, then, mirror the historic role of shamans in Cuchumatán ecology, mediating the relationship between esoteric forces outside the remit of everyday life, be they cartels or malevolent spirits, and their effect on local livelihoods and the swidden cycle. Based on two years of ethnographic fieldwork in San Juan Atitán and its diaspora, this paper examines how coyotes, in mediating the uncertain futures of Mayan migrants, also mediate the relations between maize fields, wood lots, mountain spirits, and God.

8700 A NAPA Professional Development Workshop: How to Facilitate Workshops that Drive Innovation

Start Date: 11/21/2025 10:15 AM **through** 11/21/2025 12:15 PM

Venue: Sheraton **Room:** Waterbury (2nd fl)

Type: Workshop

Innovation doesn't happen in a vacuum - it's sparked by diverse perspectives, shaped by cultural context, and often achieved through structured collaboration. This workshop teaches anthropologists and like-minded practitioners how to design and lead innovation workshops using human-centered design and participatory methods. Participants will learn practical facilitation tools and techniques that help diverse groups think creatively and collaboratively, whether the goal is to design a new product, reimagine a service, or develop an organizational strategy. We'll explore methods for generating ideas, aligning stakeholders, and moving from insight to action. The final activity will be a mini-workshop simulation to build confidence through hands-on practice. Whether you're in UX, organizational design, or simply curious about facilitation methods, this session equips you to lead more impactful workshops grounded in anthropological insight and inclusive design. No prior experience needed, just bring your curiosity and a willingness to co-create.

8699 NAPA/AAA Careers Expo

Start Date: 11/21/2025 11:00 AM **through** 11/21/2025 4:00 PM

Venue: Marriott **Room:** MGB Salon F/G

Type: Special Event

Curious about careers in Professional, Practicing, and Applied Anthropology (PPA)? Join the National Association for the Practice of Anthropology (NAPA) for the 21st Annual Careers Expo. Meet with Career Guides from across our discipline and across industries for lively conversations about how anthropological training positively impacts the public and private sectors. Learn from established professionals and get your questions answered about best practices for putting anthropological skills to work. Networking is encouraged, so get ready to practice your elevator pitches with a friendly audience. Students, academic and applied mentors, and career changers welcome!

8663 The Council on Anthropology and Reproduction (CAR)

Start Date: 11/21/2025 11:45 AM **through** 11/21/2025 12:45 PM

Venue: Marriott **Room:** Beuregard

Type: Special Event

The Council on Anthropology and Reproduction (CAR) was founded in 1979. Our members come from countries across the globe and professions at the center of anthropology and well beyond. CAR facilitates networking through social media, listserv, our biannual newsletter, membership directory, and special events at the American Anthropological Association annual meetings as well as meetings of the Society for Medical Anthropology and the Society for Applied Anthropology.

8660 Anthropological Responses to Health Emergencies (ARHE)

Start Date: 11/21/2025 11:45 AM **through** 11/21/2025 12:45 PM

Venue: Marriott **Room:** Bonaparte

Type: Special Event

Anthropological Responses to Health Emergencies (ARHE) is a Special Interest Group of the Society for Medical Anthropology. The purpose of the group is to network among members to be able to rapidly respond to developing public health issues and emergencies.

8613 Society for Economic Anthropology Business Meeting

Start Date: 11/21/2025 11:45 AM **through** 11/21/2025 12:45 PM

Venue: Marriott **Room:** Galvez

Type: Special Event

Society for Economic Anthropology Business Meeting: All are welcome! Join us for the latest news, updates, announcements, and celebrations of recent awards!

8772 Association for Africanist Anthropology - Board Meeting

Start Date: 11/21/2025 11:45 AM **through** 11/21/2025 1:15 PM

Venue: Marriott **Room:** Lafayette (41st Fl)

Type: Special Event

Meeting for the Executive Board of the Association for Africanist Anthropology

8665 The Dying and Bereavement Interest Group

Start Date: 11/21/2025 11:45 AM **through** 11/21/2025 12:45 PM

Venue: Marriott **Room:** Studio 1

Type: Special Event

The Dying and Bereavement Interest Group has developed in response to the growing body of anthropological research and interest in this area of study. The scholars in this group see as its function the following: organize interest group meetings as the Annual AAA meetings organize and submit panels and other presentations at AAA and other professional association meetings networking, mentoring and collaboration to support research and publication communication (notices of conferences, workshops, grants, etc.) publicize anthropologists' work on dying and bereavement to members of the public, the media, and scholars and practitioners from other disciplines connect to other committees that share the same research interests

8668 Health Professions Education (HPE)

Start Date: 11/21/2025 11:45 AM **through** 11/21/2025 12:45 PM

Venue: Marriott **Room:** Studio 5

Type: Special Event

Our mission is: "To support anthropologists in making a positive and lasting impact on medical and health professions education by creating an organizational space that nurtures healthy

professional identity, promoting lifelong career advancement, and serve as a representative voice for anthropology among the health professions and the public."

9083 Anthropological Theory Journal Editorial Board Meeting

Start Date: 11/21/2025 11:45 AM **through** 11/21/2025 12:45 PM

Venue: Sheraton **Room:** Crescent (4th fl)

Type: Special Event

Informational / networking meeting for the Anthropological Theory Journal Board.

8664 The Disability Research Interest Group (DRIG)

Start Date: 11/21/2025 11:45 AM **through** 11/21/2025 12:45 PM

Venue: Sheraton **Room:** Edgewood AB (4th fl)

Type: Special Event

The Disability Research Interest Group (DRIG) is a network of scholars, educators, activists, and practitioners invested in building ties between people who contribute to disability anthropology. As a special interest group (SIG) of the Society for Medical Anthropology, we foster disability research in and across all fields of anthropology. The DRIG understands disability anthropology to be research that seeks to theorize disability by documenting and analyzing the diversity of everyday life experiences of people with disabilities across space, time, and social and cultural context. We situate the medicalization of disability as a sociocultural phenomenon with political

8640 Society for Psychological Anthropology (SPA) Board Meeting

Start Date: 11/21/2025 11:45 AM **through** 11/21/2025 12:45 PM

Venue: Sheraton **Room:** Estherwood (4th fl)

Type: Special Event

This event is open only to current board members of the SPA.

8839 Society for Visual Anthropology Board Meeting

Start Date: 11/21/2025 11:45 AM **through** 11/21/2025 12:45 PM

Venue: Sheraton **Room:** Evergreen (4th fl)

Type: Special Event

Society for Visual Anthropology Board Meeting

8765 Society for Linguistic Anthropology (SLA) Mentoring Program Luncheon

Start Date: 11/21/2025 11:45 AM **through** 11/21/2025 12:45 PM

Venue: Sheraton **Room:** Grand Couteau (5th fl)

Type: Special Event

The SLA Mentoring Program partners scholars at different stages of their careers who are interested in mentoring or finding a mentor, and to facilitate their mentoring relationship. This luncheon event

offers a chance for new mentors and mentees to meet in person, exchange ideas and reflections on mentorship, and for established mentor-mentee pairs to share their experiences. We also welcome anyone interested in becoming or finding a mentor. Pre-registration is required.

8667 Research on U.S. Health and Healthcare (RUSH)

Start Date: 11/21/2025 11:45 AM **through** 11/21/2025 12:45 PM

Venue: Sheraton **Room:** Orpheus (8th fl) (access via elevator only)

Type: Special Event

Research on U.S. Health and Healthcare (RUSH) is a Special Interest Group of the Society for Medical Anthropology. RUSH invites and encourages scholars from around the world to critically investigate U.S. health policy and practice. RUSH provides a space for anthropologists to engage with the urgent and growing national dialogue on health and healthcare disparities and a platform to interface with health authorities and policymakers.

8745 Beyond the Academy: Mentoring for Impact, Innovation, Career Success and Policy Engagement

Start Date: 11/21/2025 11:45 AM **through** 11/21/2025 1:15 PM

Venue: Sheraton **Room:** Poydras (5th fl)

Type: Special Event

As global challenges grow more complex, the relevance of anthropological insights beyond academic settings becomes ever more urgent. This mentoring session, co-hosted by the Association for the Anthropology of Policy (ASAP) and the Association for Africanist Anthropology (AfAA), supports PhD students in exploring pathways to apply their training in diverse policy, advocacy, consulting, cultural, academic and research contexts. With an emphasis on navigating careers within and beyond the academy, the session focuses on open dialogue on strategic skill-building that will enhance success in transitioning from graduate school, institutional navigation, and personal values and building relevant networks and portfolio.

8814 A&E Graduate Student Mentoring Workshop -Day 2

Start Date: 11/21/2025 11:45 AM **through** 11/21/2025 1:45 PM

Venue: Sheraton **Room:** Rex (8th fl)(Access vis elevator only)

Type: Special Event

Students will submit either: a dissertation proposal, dissertation chapter, or journal article for consideration. Students selected to participate in the workshop will receive feedback from an A&E member mentor and receive comments on their work before the AAA conference.

The second session will consist of group discussion focused on navigating the academic and non-academic job markets, with insights from environmental anthropologists who have recently been on the job market.

8653 ASA Annual Luncheon and Meeting- offsite

Start Date: 11/21/2025 12:00 PM **through** 11/21/2025 2:00 PM

Venue: Offsite

Type: Special Event

As in years past, ASA members will gather from noon to 2 pm on Friday, November 21, at the nearby Red Fish Grill restaurant for a delicious lunch of regional cuisine, announcements, and lively conversation with colleagues. The luncheon is a section membership benefit open to ASA dues paying members. Each member is entitled to bring one guest for \$40 per guest

8619 The Committee on the Anthropology of Science, Technology, and Computing (CASTAC) Business Meeting

Start Date: 11/21/2025 12:00 PM **through** 11/21/2025 1:15 PM

Venue: Sheraton **Room:** Oak Alley (4th fl)

Type: Special Event

Business meeting for members of this group.

2549 Anthropology of/and Universalism(s)

Start Date: 11/21/2025 12:45 PM **through** 11/21/2025 2:15 PM

Venue: Marriott **Room:** Bacchus

Type: Roundtable/Town Hall

Anthropology has a complicated relationship with universalism and universalising language. As a discipline devoted to the study of cultural diversity, the claim that something is a "human universal" is often met with skepticism, if not accusations of ethnocentrism or the whitewashing of meaningful difference. Within the AAA, discussions of ostensibly universal values have led to debates, uneasy truces, and unsatisfying fudges, with the fissure between rights-based universalism and ethnographically-informed relativism never quite fused.

Yet anthropology is also a universalist field. Whether framed in terms of psychic unity or the moral equivalence of vastly different ways of being, ethnographers have long recognised the universal dignity of being human. Moreover, we are often confronted with the universalism(s) of those with whom we work, whether in relation to salvation, globalisation, or the inevitability of certain economic forms.

What is or should be contemporary anthropology's relationship to universalism, whether we encounter it as ethnographic data-that is, in the words and ideas of our interlocutors-or as a philosophical lens through which to interpret these words and ideas? Is universalism best understood in terms of inclusion or as the erasure of difference? How should anthropology-as the scientific study both of what we share and of what distinguishes us from one another-interrogate the universalism(s) we find in the field?

Our roundtable participants approach these questions from a range of perspectives, as ethnographers of religion, philosophy, economics, colonialism (and decolonisation), and the universe itself:

Dr Jon Bialecki is an anthropologist of technology, transhumanism, and US religion. His recent work explores the "universalisms" of both Mormonism and transhumanism.

Dr David Jeevendrampillai is an anthropologist of Outer Space whose research examines the curation, narration, and use of Earth Imagery from the International Space Station. He is interested in the anthropology of the future, technology, and the cosmos.

Dr Miranda Sheild Johansson is an anthropologist of tax. Her research with taxpayers in Bolivia, the UK, and Sweden explores how fiscal systems perpetuate financial logics which are universal and inescapable, yet differently lived within.

Dr Méadhbh Mclvor is an anthropologist of law and religion. Having previously conducted research with a community that draws firm boundaries between "in" and "out," her more recent work explores theologies of inclusivity among US Unitarian Universalists.

Professor Soumhya Venkatesan is an ethnographer of religion and philosophy in India and the UK. Her most recent book is a critical exploration of decolonisation in, of, and by anthropology-a project she frames as a provisional universalism.

Together, our roundtable will explore universalism, relativism, and the contingent, bringing contemporary concerns to bear on a longstanding debate.

7848 Spectral Thinking: Fetishism, Taboo, and the Ends of Structuralism

Start Date: 11/21/2025 12:45 PM **through** 11/21/2025 2:15 PM

Venue: Marriott **Room:** Balcony I

Type: Oral Presentation Session

This panel investigates the problem of the spectral and its relationship to the anthropological objects of the fetish and the taboo. We understand the spectral as the "nonmaterial" (Durkheim 2014) element of social life that gives way to a "necromancy" (Marx 1992) between persons and the objective world. In this sense of the spectral, we examine how objects produce an excess that motivates the desires stoked by fetishism and the social relations that are enabled by the prohibitions of taboo. As William Pietz argues, the fetish is not only a subject of anthropological theory, but emerged through the very encounters enabled by ethnological studies: "The fetish, then,

not only originated from but remains specific to the problematic of social value of material objects as revealed in situations formed by the encounter of radically heterogeneous social systems" (Pietz 2022). Because both fetishism and taboo suggest a kind of spectral matter through which communal value is generated, this panel seeks to critically investigate such matter in relation to political economy and the circulation of specters that it makes possible: the logics of racial subjectivity in the colony, the enigmatic ways that war seeps into the lifeworlds of its subjects, and the redoubling of colonial logics in articulations of decolonial futurity. How do we analytically locate this spectral matter through ethnography, the historical archive, or in political discourses? And what are the conditions that make the specters of fetishism and taboo intelligible as a social reality for its subjects? Do they persist in a purely psychic and symbolic register, no longer supported by the explicit force of law, or does it maintain a structural purchase after formal independence or what Saidiya Hartman calls the (non)-event of emancipation (Hartman 1997)? If so, how, by what means, and with what symbolic or material accompaniments? This panel takes this ensemble of questions as our direct terrain and we turn critical attention to the ways in which the concepts of the fetish and the taboo might make visible the terms of racial order that precede and follow the law of exogamy, reproduction, exchange (Levi-Strauss 1969) and their correspondent political forms (Clastres 1988).

Presentation(s): Heredity, Guilt, Sacrifice

This paper provides a critical interrogation of how feminist science studies and social reproduction feminisms approach epigenetics as a conceptual intervention into kinship. While some feminist science scholars argue that innovations in epigenetic science risk intensifying reproductive constraint, the social reproduction feminisms pose that epigenetics unmoors nuclear heterosexuality, providing fertile ground for rethinking kin toward liberatory ends. Despite this difference, both positions treat kinship as an object to preserve and ultimately protect, with epigenetics evaluated insofar as it contributes to this project. In the paper, I argue that this desire for preservation is structured by a gendered antiblackness haunting its political purchase. Through a reading of *Corregidora*, I argue that because antiblackness is not the denial or withdrawal of kin, but an expression of its total conceptual impossibility, what a Black reproductive politics demands is unflinching antagonism to kin as structural form, a reproductive negativity conceptually generates itself from the unthinkable space of antagonism to reproduction-qua-itself.

The Pig and its Other: A Phenomenology of Enmity

This paper explores the use of the pig as a sign of enmity and terror against Islamic communal life. As a generalized practice, the use of the pig as a weapon that desecrates Islamic holy sites occurs throughout the globe: in India, Germany, South Korea, and in numerous other polities. In many cases, the head of the pig composes the most nefarious weapon used by civilians, shattering mosque windows and glass doors. In other cases, bacon, rotten pork meat, ears, and dead carcasses are left outside mosques and, at times of physical intrusion, thrown inside their places of veneration. And yet in other cases, the pig is determined as a symbol, with hats and shirts that display bacon or other parts of the pig with the ascription "Muslim kryptonite." The pig's availability as a sign of enmity and terror provides an analytical opportunity to critically interrogate its significative and coercive force: why the pig's body? The paper addresses these questions through an ethnographic study of two specific incidents in the United States and draws on the relationship between food taboo, social community, and political force. As such, the paper theoretically explores how a sense and meaning is given to the pig precisely because the aggressor is often unknown and thus absent from the scene. I thus examines how Islamic communities in the aftermath of events of desecration trace this ghostly absence through the aid of law enforcement, political discourses, and intercommunal relations.

Rape culture; or, anti-blackness and the problem of lived experience

A (re)turn to the discourse of sexual violence during apartheid in South Africa turns out to be a (re)turn to the structural contradiction that organizes classical anthropology, and leads to a consideration of the structural contradictions that organize nationalist discourse in the "postcolony" that remains a settler colony. The ethnographic gesture, an inheritance from Kant, which shuttles between the particular –"lived experience"–to a transcendental principle is in pursuit of a mediating third term: culture. In keeping with this ethnographic gesture, I interrogate the concept of "rape culture" as a figuration of the limit of the anthropological axiom that culture is premised on the legitimation of some forms of violent access to women and the foreclosure of others via the incest taboo, that unlocatable process and fantasized moment of rupture from nature that culture was "born." While rape confuses this boundary, I argue that opposing rape through recourse to the rights of women is coextensive with the system that permits both the legalization and the confusion of the law of violence against black women in capitalist colonial modernity. In the idiom of the ethnographic, the paper weaves together intimate and public discourses around sexual violence in contemporary South Africa, scenes of coming-of-age under apartheid, and Fanon's elaboration of the psychosexual arrangement of colonial society.

Presentation(s): "Like a tree without roots": Belarusian women's communities of care and resistance in exile

My multimodal and multisited ethnographic project grows from collaboration with older women from Belarus who were forced to flee their homeland after the 2020 anti-authoritarian uprising and co-create survival strategies in exile in Poland. Drawing on the ethnography of women's and disability movements in postsocialism (Hement, 2007; Kolářová, 2015; Phillips, 2010; Vazyanau, 2023) and anthropology of care and transnational migration studies (Francisco-Menchavez, 2018; Baldassar et al., 2020; Arnold, 2024), this presentation narrates insights from the long-term ethnography of digital and urban community spaces and participatory activities, such as online protest communities and street rallies ethnography, and art-based collaborative workshops. Attending to everyday forms of providing for others (Arnold & Aulino, 2021), the author offers to reflect on how aging and disability shape and reshape relational care infrastructures co-created by women in the past experiences of resistance to structural and authoritarian violence and stretched over borders and in time to cope with present challenges of forced migration. In the first part, the presentation briefly introduces the concept of care infrastructures derived from the interdisciplinary literature and ethnographic data. In the second part, the author shares visuals and brief ethnographic vignette to show how care infrastructures are enacted by women to sustain disrupted relationships across borders and rediscover community roots in exile.

Artificial Intelligence as a Mass Medium

This manuscript proposes a conceptualization of generative artificial intelligence (AI) as a mass medium. In 1996, Morris and Ogan introduced a framework for understanding the internet itself as a mass medium, expanding our understanding of what a mass media is. This manuscript seeks to do the same for AI. First I explore the similarities and differences between AI and the internet, arguing that AI not only mediates and is mediated, but also produces new and novel media. Then, using a multidisciplinary theoretical scoping review of literature across media studies, science and

technology studies, and anthropology, the manuscript at-hand asks: What and when does AI mediate, and what and when does it not? And how might AI mediation (re)configure human subjectivities? These questions, and their provisional answers, open new pathways for media, digital, and virtual anthropology-expanding its analytic commitments and methodological horizons in the face of rapidly evolving media technologies.

Domesticating Chinggis Khan: Political Belonging and Historical Engagement of Mongolians with the Statue of Chinggis Khan

This paper explores the ways in which contemporary Mongolian people engage with the statue of Chinggis Khan in Sukhbaatar Square, Ulaanbaatar, which is at the political center of modern Mongolia. It has been argued that the statue embodies efforts of the modern state to appropriate Chinggis Khan in constructing national identity (Myadar 2017). And yet, there are certain ways of engaging with the statue among Mongolians that go beyond the political and ideological project at the level of the state. In everyday life, many Mongolians have chosen to take their wedding pictures at the square with the statue of Chinggis Khan in the background, which echoes the practice of placing portraits of Chinggis Khan in prominent places in family homes. The ubiquity of Chinggis Khan in everyday life traverses the boundary between public and domestic spheres and challenges this well-established dichotomy. It also speaks to an engagement and entanglement with history at the level of individuals that complicates the notion of the political. How do such practices of engaging with monumental forms relate to the efforts of situating the modern state in history, and those of fostering a sense of belonging? My project will gather information about the statue of Chinggis Khan and trace prominent forms of engaging with it both with and without overtly political underpinnings. Ultimately, I want to revisit the complicated relationship between modern states and premodern ones from the perspectives of historicity and political belonging.

Getting Lost, Navigation and Spatial Precarity: The case of Bangladeshi women in Buffalo, NY

--Dr. Zahir Ahmed, And Fatema Bashir

Abstract

This paper builds upon ethnographic study on our ongoing research on Bangladeshi Diaspora in Buffalo, NY. This is gendered aspect of migration. We will be talking two interrelated concepts: the displacement from Bangladesh and NYC where they first settled and moved into Buffalo and second involves abandonment (single mother/ divorcee) and both throw light on the ways in which gender, space and emplacement work together to produce particular vulnerabilities. In the first, women are considered as dependents of the male migrants and thus being subordinate playing traditional patriarchal values and norms. In the second, women are being placed in inferior region in Buffalo to survive. Sometimes they have husbands, living in NYC and some are abandoned and displaced from their marriages when their husbands divorce/separate them.

The context is a rapidly changing urban environment in Buffalo in which the livelihood cost and housing are surprisingly cheaper compared to other areas in the US. Owning a housing and an unskilled job have led to a cityscape that is never possible in other areas. This environment, and the socio-cultural relations that are constitutive of it, have helped to create the conditions in which certain women survive and others get lost, leading to highly gendered forms of displacement. This neglect of women migrants means that if we only focus on what is visible, some forms of displacement are likely to be overlooked. Indeed, attention to the experience of getting divorce and being abandoned can help foreground questions of gender, class, age and migration status in the analysis of migration/ in-migration.

In this paper, we will argue that attention to lost, abandoned and missing Bangladeshi marginalized women migrants brings new perspectives for the anthropological study of displacement. Arising from dislocated, the journeys they take are largely hidden from the research gaze. As our material shows, being lost and/or abandoned is, in cities such as Buffalo, commonplace if one is female, and, as we discovered during our fieldwork, the fallout is part of

the everyday case load of the government or charities in Buffalo that offer various supports. Breaking 'purdah' (veils) the women's entry into labour market embrace the creative potential of the ghostly and the spectral. The metaphoric 'ghosts' take many forms. They appear in social and work sites like Amazon. Through gossips, they express useful metaphors against the patriarchic power, or hold individual finances that lurk in the shadows of daily life. They can be found in the impacts of using money in their own ways, whether it be of households or epistemologies. They manifest in the forms of disagreement and contestation, through which self-reliant is mediated, masks of all-too-real suffering. They challenge long-discredited patriarchy that fuel religious extremism.

Ghosting the Family Home: Ethnographic Reflections on Heritage, Ruin, and My Family's Return to Vietnam

This paper is an ethnographic account of my "entrance" into my family's home, after seven years of having orally interviewed about it and two years of (re-)relocating in our motherland, Vietnam, from which we were cast as refugees during the Vietnam War. I trace not only the material conditions of our abandoned home-now rumored to be haunted by my great grandmother's ghost-but also its affective resonances. How has this space been made sacred? What is the line between access and trespass in a "haunted home"? And how has the figure of my great grandmother's ghost brought particular meaning to this otherwise meaningless patch of land?

Ultimately, I am interested in "ghost" not merely as a passive, mysterious object but as a creative act of the diaspora-as a verb. How do diasporic families, especially those who experienced traumatic dispossession of their homes, "ghost" the remnants of their lost pasts? What does "return" look like in this context? I understand the term "ghost," then, as an intentional community ritual which seeks to protect a (material) connection to displaced pasts/places/people, and to offer

emotional (affective) reprieve from histories of death. In the case of my family's abandoned home, my entrance itself was long-awaited because it required the coordinated efforts and emotional willingnesses of multiple actors: my grandfather, who bore the right to memory and who the neighbors indeed remembered; my mother's cousin Dì Trang, who possessed the local knowledge and connections to book us a bus into the deep forest; my oldest aunt Dì Hai, who could easily traverse between Vietnamese and English and who was the last of any generation to remember this family past; and finally, my mother, without whom I would have no connection to this "strange meeting place between that which we memorialize[d] and that which we discard[ed]," as Kevin Lewis O'Neill writes.

This year marks 50 years since the Fall of Saigon and the end of the Vietnam War. In 2017, Viet Thanh Nguyen wrote that "for most Americans and the world, 'Vietnam' means the 'Vietnam War,' and the Vietnam War means the American war, with novels written by American men about American soldiers." Since then, Vietnamese scholars, writers, and artists of the diaspora have continued to reclaim our history. My paper contributes to this archive of decolonial remembrance. As an ethnographic account, it further seeks to center oral tradition, family narrative, and ordinary encounters as meaningful ways we might study and think about (contested) history.

Great Expectations: Global Chinatowns, Cultural Transformation and China's Soft Power

China's desire for a stronger presence on the global stage has turned Chinatowns into sites of emerging global city-building that ultimately reflects and promotes a shifting geopolitical framework that prioritizes China's interests. Instead of a cosmopolitan identity in global spaces, China's nationalist approach in international politics indicates the state's efforts in recalibrating notions of Chinese identity. What is especially compelling is how these cultural efforts are extending to Chinese identities beyond its borders. This phenomenon of "calling" overseas Chinese back to the motherland, I argue, has a correlation to China's utilization of "soft power" to gain influence and cultural salience on the global stage. Having overseas Chinese, and celebrities in particular, manifest their loyalty to a specific nationality can translate into a form of soft power through their ability to provide positive attraction to Chinese culture abroad. Ironically, cultivating more soft power to be deployed beyond China's borders comes in the form of "hard power" towards overseas Chinese. This interplay of local, national, and global forces on contemporary Chinese identity is investigated through ethnographic research conducted in several Chinatowns located in San Francisco, London, and Vancouver.

Presenter(s): Jennifer Heung

Specters of Coal: Haunted Cultural Landscapes in West Virginian Mining Towns

Appalachia has long occupied a curious dualism within the American imaginary. Both core and periphery, colony and colonizer, structurally dependent and ruggedly individual, it embodies the myriad contradictions at the heart of American exceptionalism, industry, and development. Beyond the blurry geographic and cultural boundaries of the region, increased extensification in modern

mining practices through the use of Mountaintop Removal (MTR) has created an ego crisis for many of its residents who are no longer able to maintain place-based identity while participating in or supporting the industry that has come to define them. Such uncanny manifestations of self, culture, and place are ripe for performative interpretation – "an interpretation that transforms the very thing it interprets" (Derrida 2012, 63) – wherein traces of labor struggle, relationship to landscape, and embodied social-ecological devastation simultaneously define and disrupt Appalachian identity and belonging. This culmination of repressed past, troubled present, and uncertain futures defies traditional phenomenological inquiry and instead requires conceptions of meaning and belonging within a cultural landscape haunted by the many ghosts left behind by extractive industry. Thus, the histories and identities within Appalachian coal country, long-neglected in the anthropological canon, represent a compelling case study for an hauntological ethnography.

Situated in the rolling hills of southern West Virginia, two small municipalities provide localized examples of the complex political-economic history of Appalachian coal country as well as the entangled histories of labor struggle, extractive industry, and environmental change throughout the region more broadly. Building on theories of cultural landscape through the lens of Derrida's hauntology, I explore themes of solastalgia, meaning, and memory by examining spectral traces of mountaineer mythopraxis in this analysis of pre-dissertation fieldwork.

Presenter(s): Noah Dennison

Staging Cinema in Assam: Ethnographic Encounters with Regional Film Production and Infrastructure

This paper draws on ethnographic fieldwork conducted in Assam, from late 2023, to examine how 'regional cinema' is produced, distributed, and exhibited in the contemporary moment. Focusing on two films, *My Three Sisters* (in Bodo language) and *Local Kung Fu 3* (in Assamese language), both released in 2024 and directed by Kenny Basumatary – I explore how filmmaking practices in Assam reflect and shape an emergent cinematic infrastructure rooted in local networks of labor, kinship, and aspiration. Through these case studies, I trace the development of a regional film industry in flux – one that both contextualizes and challenges dominant narratives of Indian cinema, which are often centered on Mumbai or other larger regional hubs.

My fieldwork involved sustained presence on the sets of both films at various stages of their production. I observed the collaborative and often improvised processes through which films are made under significant financial and institutional constraints. In these settings, filmmaking becomes a form of relational labor, mobilizing not only professional actors and technicians but also family members, friends, and community networks. The production of *My Three Sisters*, a drama centered on Bodo-speaking characters, and *Local Kung Fu 3*, a comedy-action sequel, offered distinct yet overlapping insights into how filmmakers in Assam navigate creative ambitions amid logistical precarity and uneven access to resources.

By following the full life cycle of these films – from conception and shooting through post-production, publicity, and exhibition – I argue that they are not isolated cultural artifacts but active nodes in a dynamic media ecology centered in Guwahati. The city serves as a key hub for regional cinematic activity, hosting production houses, editing suites, digital distribution platforms, and cinemas. Yet much of this infrastructure remains informal, affective, and improvisational: rented apartments become makeshift studios; fan-driven digital networks handle publicity and circulation; and personal relationships with cinema owners facilitate limited theatrical releases.

This presentation uses *My Three Sisters* and *Local Kung Fu 3* as ethnographic and conceptual anchors to map the contours of Assam's regional cinema infrastructure. In doing so, I argue that regional film cultures in India must be understood not only through their linguistic or aesthetic features but also through the material and infrastructural conditions that enable their creation. Attending to the everyday practices, spatial arrangements, and economic logic of filmmaking in Assam contributes to broader anthropological discussions on media infrastructures, regional cultural production, and the political economy of cinema in South Asia.

Presentation(s): Clashing for the Future: How Queer Prefigurative Politics in Idaho Navigate Increasing Hostility

Prefigurative groups that build alternative institutions for future use hope to help their members navigate hostile political environments by preventing, avoiding, confronting, or seeking conflict. However, we do not know if those methods are effective and if groups retain community members using these methods. I explore the practices of a queer prefigurative group in Idaho, with the following questions: First, how does the group navigate physical, structural, and psychological violence in order to support the local trans community? Second, how does the trans community decide between the prefigurative group and a liberal, policy-oriented organization for support in various adverse life situations? Using in-depth interview and participant observational data, I will outline relationships between mechanisms of navigation, support for affiliates, and decision-making processes to illuminate how affiliates choose organizations for support or resources in different adverse life situations or for different needs (financial, health, housing etc.). Understanding the relationship between community conflict resolution and individual decision-making helps bring forward conflict solutions for social movements in hostile political

environments that attract marginalized individuals that would otherwise have little resources for support.

Presenter(s): Sascha Ilin

Ghosted Categories, Lingering Figures: Gender Continuities Among Waria and Transpuan in Indonesia

Anthropologists have long examined local manifestations of queer identities in Southeast Asia (Jackson 2000; Sinnott 2004; Boellstorff 2005; Peletz 2009), highlighting the diverse ways that cultural traditions and gender categories promote fluidity in the region. This paper presents findings from my broader dissertation project on how queer and gender nonconforming communities use embodied and discursive strategies to assert legitimacy in Indonesia. Over the past decade in Yogyakarta, south-central Java, there have been significant social and linguistic shifts in how trans-femininity is expressed. The term waria (a longstanding term associated with transwomen, combining the words "men" and "women" in Bahasa Indonesia) has become particularly contested across generations as queer communities challenge its historical and linguistic roots. Drawing on 12 months of ethnographic fieldwork, including collaboration with waria communities from a trans-led Islamic school, I trace shifting attitudes toward the term waria and the increased promotion of inclusive, globally oriented terms like transpuan (transwomen) in urban and middle-class queer spaces. Rather than creating two divergent streams, I argue that the relationship between waria and transpuan is one of fractured continuity. While waria may function as a ghosted category, a residue of the past and a becoming of historical artifact, it continues to hold lingering significance. Waria is not simply replaced by transpuan but is folded into its very emergence. The DNA of waria (i.e., its histories, aesthetics, bodily habits, and moral discourses) remains embedded in the evolving landscape of trans categories in Indonesia. This paper considers how naming practices become contested sites where legitimacy is negotiated with broader political implications: who gets recognized and who is seen as socially legitimate. In this context, haunting is not only metaphorical but methodological, illustrating the temporal entanglements and archival traces that animate contemporary queer worldmaking in Indonesia.

Presenter(s): Amirah Fadhlina

Spectral Presences and Embodied Absences: Cotita de la Encarnación and Magistrate Baena

This flash presentation brings into dialogue two gender-transgressive figures from Mexican history: Cotita de la Encarnación, who appears in colonial legal archives, and Magistrate Jesús Ociel Baena, the country's first non-binary magistrate, whose death in 2023 sparked national outrage and mourning.

Though centuries apart, both figures haunt Mexico's cultural imagination. Cotita emerges in fragments-trial records, descriptions, silences-reminding us that gender nonconformity existed long before the language we use to describe it today. Baena, on the other hand, left behind a visible legacy of activism and defiant presence, now echoed in street memorials, digital tributes, and legal debates.

I explore these figures as spectral presences that challenge dominant narratives of gender and nationhood. I propose a framework of transgenerational haunting—a way to trace how queer and non-binary lives persist across time, often as ghosts who refuse to disappear. These hauntings not only reveal systemic violence, but also open space for memory, resistance, and political imagination.

The [i]Otaku[/i], the [i]Otokoyaku[/i], and the Ghost of Oscar Wilde: Echoes of the Victorian Queer in 21st Century American Anime Fandom

During Japan's intense modernization period in the late 19th and early 20th centuries, themes of Western individualism as sophisticated and aspirational yet decadent and perverse were exemplified in the figure of Oscar Wilde, an object of (mutual) fascination for Japan, whose work had an influence on literature, theater, and social change. Industrialist Kobayashi Ichizō was able to subdue and domesticate the tropes of same-sex love and gender rebellion that soon emerged in young women's culture when he founded the all-female Takarazuka Revue, a performing arts academy for girls, in 1913. However, the respectability of these performances also gave female masculinity and same-sex desire, previously the subject of moral panics, the ability to hide in plain sight. The Takarazuka Revue, and particularly the [i]otokoyaku[/i] (female actors who play the male roles), have remained popular into the 21st century and have had a significant influence on the way male characters are drawn in manga, or Japanese comic books (particularly those marketed to girls and young women), which are frequently the source material for the anime (animated cartoons from Japan) that enjoys global popularity.

In my ethnographic research among anime otaku (as the Japanese call nerdy superfans) in the United States, conducted between 2011 and 2024, I have observed the emergence of an elegant androgyny that remixes elements of masculinity and femininity in highly idiosyncratic ways, in which visual echoes of the [i]otokoyaku[/i] are apparent, exhibited by persons identifying with a range of genders. This is coupled with what I call a "queer ethos" within the fandom overall, which naturalizes gender fluidity and lionizes LGBTQ+ identities as both exemplars and symbols of brave and authentic selfhood. Thus, ostensibly "straight" and "cis-gendered" members of this fandom subculture not only support non-normative genders and sexualities in others, but playfully cultivate elements of these qualities within themselves, and view their own normativity as "coincidental." This disregard for bounded identity categories, in contrast to older iterations of queer identity in America, moves my interlocutors beyond the notion of an "LGBTQ community" and a set of "allies," and creates a vital structure of support. Although many of my subjects grew up in an era of political gains for these marginalized identities, they themselves point directly to the semiotics and literary tropes they see in Japanese media as inspiration for their own freedom of self-expression and the acceptance of same-sex love within their cohort. Although most of them are not aware of its source, I posit that there is also a frisson of familiarity in the echoes of Japan's fetishization of Euro-American queerness. In this presentation, I will tease out the threads of these similarities and point out the differences that give us cause for hope in dark times.

Presenter(s): Deirdre Clyde

Trans-Haunting: The Spectral Politics of Transness and Mis/translation in Xiaodi

This paper juxtaposes scenes from the documentary Xiaodi with ethnographic scenes from the Q&A session following Xiaodi's public screening in Seattle. I use trans-haunting to articulate the way that both transness and (mis)translation can be intimated through spectral tropes of haunting, ghostliness, and exorcism.

In the first section of this paper, I analyze several scenes from the Sinophone trans documentary Xiaodi. I argue that spectral tropes of haunting can function simultaneously as a site of cisnormative violence of containment and a means through which trans subjects can articulate the complex and elusive experiences of gender dysphoria and an alternative trans temporality. I examine how the spectral tropes of haunting and exorcism are used in conjunction with spatial tropes of containment/escape and inside/outside to justify transphobic violence, where ironically, exorcism is articulated as a form of cure and containment is articulated as a form of care. Yet, these same spectral tropes of ghostliness, haunting, and exorcism sometimes also inadvertently speak to trans folk's own felt relationship to gender-the way that trans life is often felt as being haunted by genders otherwise, and the experience of having a spectral relationship to one's body and temporality.

In the second section, I turn to moments of mis/translation during the screening Q&A as a site of trans-haunting, attending to them ethnographically. Drawing on tropes of spectrality and spatiality again, I argue that mis/translation can also be understood as a form of exorcism and containment. In doing so, I reframe mis/translation not as a failure of authenticity or fidelity, but as a space in which ghosts-things that remain invisible, silenced, or absent-demand the attention and care of listeners, summoning us to question where translatorial ghosts haunt and how ghosts are hosted, cared for, or exorcised by translators, listeners, and others. Attending to the ghostly dimension of mis/translation, I propose, can also illuminate the spectral aspect that constitutes our own practices of voicing and listening.

7373 Eerie Overlaps in Food Sovereignty and Nationalism: Part One

Start Date: 11/21/2025 12:45 PM through 11/21/2025 2:15 PM

Venue: Marriott **Room:** Balcony L

Type: Oral Presentation Session

Food justice, food sovereignty, food security, and efforts to ensure access to good food are generally understood as positive goals, but when people with commitments to ethnonationalist ideologies or advocacy for punitive criminal justice efforts can be under the same umbrella as emancipatory, racial justice, and anti-colonial efforts, then the umbrella concepts deserve greater scrutiny and examination. This panel explores the various ways causes drawing from opposed political viewpoints can fall under the same food politics, and how we as anthropologists should respond to that reality.

Section: Society for the Anthropology of Food and Nutrition

Presenter(s): Ryan Adams, Lycoming College, Anthropology Department, Mandy Muise, Vanderbilt University, Elizabeth Onyango, University of Alberta, Liliana Rocío León

Presentation(s): Reclaiming Our Food: Food Sovereignty in Anti-Colonial Context

This paper examines the rhetoric related to food sovereignty among Puerto Rican activists trying to decolonize their food system. Puerto Rico imports nearly all the food consumed on the island. The food system enriches companies based in the colonizing mainland and impoverishes and endangers Puerto Ricans due to the predominance of fast food and unhealthy processed food. Puerto Ricans are justifiably angry at this arrangement and fighting to establish and rekindle native food sourcing on the island, in particular through agroecological approaches and various alternative food networks. Meanwhile, back in the colonizing mainland of America, anti-foreigner and ethnonationalist rhetoric is becoming disturbingly common. Rhetoric among mainland Americans that opposes globalized multicultural ideals and calls for putting America first in our food system has some overlap with rhetoric among Puerto Ricans working to free themselves from a food system conditioned by their unequal political conditions. That some phrases might sound similar, is of course best understood by recognizing that the phrases are coming out of the mouths of the colonizer in one instance and the colonized in another, but the comparison nonetheless leads to some interesting tensions that this paper explores.

Spectral Foodscapes: Food Sovereignty and Community Markets in Nashville, Tennessee

This paper explores two community markets located in Nashville, Tennessee, that emerged as alternatives to increasingly gentrified farmers' markets. Drawing upon ethnographic fieldwork, archival research, interviews, and oral histories, this project interrogates the ways that urban agriculture, community gardening practices, and local markets are indicative of collective agency and community resistances to food apartheid. Drawing upon Black Geographies (McKittrick 2006; McKittrick and Woods 2007), Black Food Geographies (Jones 2019; Reese 2019), as well as what Gamez and Monreal (2025) call the "palimpsest" of racialized geographies, this project explores the specters of violence that remain embedded in racialized landscapes as they are relived and revived across time and space, reproduced within the food we eat and through the individuals with whom we collaborate.

Criminalization of food and geographies of engagement in community-led initiatives for food secure ethno-cultural communities in Canada

Although food insecurity in Canada is a racialized inequity issue that disproportionately affects marginalized populations, existing food security interventions and policies do not reflect the cultural food needs of the at risk communities. Additionally, the engagement of the racialized

populations in designing and implementing such policies and interventions is an under explored topic in Canada. Yet, the formulation and designing policies and interventions for food security require community-engaged research that concretely identifies cultural values and practices of the disadvantaged populations. Furthermore, such initiatives must go beyond addressing hunger to also combat systemic factors associated with intergenerational poverty, discrimination, and criminalization of food. In this paper presentation, I discuss the shifting definition of food at and across borders and the geographies of engagement of immigrants in community-led and government initiatives for food secure ethno-cultural communities in Canada. The presentation highlights the temporal, place, and systemic factors that influence such definitions and the participation of immigrants in the decision-making processes on food security initiatives. The findings are not only relevant in the formulation of policies and interventions to address the cultural food needs and the social integration of newcomers but also for Canada's current and future sustainable economic and social growth.

Food Justice Strategies of Latino Migrants in Bloomington, Indiana

Bloomington is a hub for local food movements in Indiana and the Midwest, and there are currently several diverse ones. However, these movements continue to focus on white cultural norms, ignoring Latinx food preferences and practices. Given this lack of representation in mainstream food movements, what alternative strategies do Latinx migrants employ to access foods that meet not only their nutritional but also their cultural needs? Food justice involves not only access to healthy food but also a critique of the racial, economic, and political systems shaping that access; it promotes culturally appropriate, sustainable diets for all. This paper has the potential to highlight how specific elements of local food discourse in the United States can foster exclusion and racial injustice and how Latino migrants navigate them.

Presentation(s): Coral, Care, and Climate Change: More-than-Human Entanglements and Ecopolitical Hauntings in Grenville Bay, Grenada

This paper explores how coral restoration in Grenville Bay, Grenada, reveals reciprocal, more-than-human entanglements shaped by climate instability, postcolonial legacies, and everyday practices of care. Based on twelve weeks of collaborative ethnographic research, I examine how local fishers and marine biologists engage in intimate acts of tending and repair-- from toothbrushing coral fragments to seagrass surveys-- as a way of surviving environmental precarity and navigating shared more-than-human futures.

These entangled ecologies are shaped not only by everyday acts of care, but also by the hauntings of repeated colonial intervention, extractive development, and ecological crisis. Grenville Bay's coral gardens are embedded in a landscape marked by multispecies loss: sea turtle nesting sites have disappeared, mangroves have been uprooted by storms, and community beaches are eroding away. An unprecedented heatwave recently devastated much of the coral nursery, leaving the majority of nursery-grown coral fragments bleached or dead. Yet rather than retreat, practitioners responded with adaptation and experimentation: building shade structures, modifying planting techniques, and recovering viable fragments to begin again.

Through these practices, coral emerges not merely as a conservation target, but as kin, collaborator, and archive--an entity entangled with the lives, memories, and futures of the human communities who tend it. The process of restoration is not linear, but cyclical, marked by grief, hope, improvisation, and care. Drawing on co-creative methods of photography and underwater video footage, I reflect on how sensory and embodied ethnography can help make visible the everyday labor and quiet resilience of more-than-human survival.

This presentation argues for an anthropology-and geography-of climate care that centers relational ethics, reciprocal vulnerability, and emergent ecological imaginaries. Grenville Bay offers a case of postcolonial reworlding, where people and coral resist the erasures of climate instability by staying with the trouble-- together. In a haunted but still-living coastal world, coral restoration becomes a radical act of care and co-survival.

Exploring Sea-Level Rise and Flooding in Miami-Dade: A Cartographic and Environmental Anthropology Analysis

Sea-level rise (SLR) has accelerated in recent decades, posing serious threats to coastal communities, ecosystems, and economic stability. Miami-Dade County, the most densely populated and rapidly urbanizing coastal area in Florida, is facing increasing risks due to its geographical exposure, hydrological vulnerabilities, and entrenched socio-environmental inequalities. While existing research extensively examines the climatic drivers of SLR, there remains a crucial gap in understanding the anthropogenic, infrastructural, and policy-driven factors that worsen susceptibility to recurrent flooding. This study employs a mixed-methods approach, integrating historical cartographic analysis, geospatial data, environmental justice frameworks, and

field observations to investigate the intersection of urban expansion, hydrological modifications, and resilience planning. Findings show that adaptation measures - such as road elevation and flood-resilient construction - disproportionately redirect floodwaters into marginalized neighborhoods. Furthermore, the widespread loss of natural flood buffers, including wetlands, has significantly diminished the region's ability to absorb storm surges and tidal inundation, further heightening flood risks in vulnerable areas. This research underscores the inadequacies of current resilience planning, which often overlooks socio-economic disparities and reinforces climate adaptation inequities. The study emphasizes the urgent need for interdisciplinary and justice-oriented SLR assessments and adaptation strategies that contextualize vulnerability within historical land-use decisions and human-environment interactions. Achieving genuine climate resilience requires a paradigm shift in policy that integrates social, environmental, and infrastructural resilience to ensure equitable protection for all communities. Without such an approach, adaptations will perpetuate environmental injustice, widen socio-economic divides, and leave the most vulnerable populations to bear the brunt of an escalating climate crisis.

Keywords: Sea-level rise; Environmental Anthropology; Geographic Information Systems; Miami-Dade; Climate Resilience.

Highlights

1. Historical land-use decisions and socio-economic disparities exacerbate Miami-Dade County's vulnerability to SLR, disproportionately exposing low-income and marginalized communities to recurrent flooding.
2. Resilience measures often benefit specific areas and individuals, resulting in adverse outcomes for lower-income neighborhoods, worsening existing vulnerabilities.
3. Current climate resilience policies fail to address systemic inequities, underscoring the urgent need for interdisciplinary, community-centered solutions that integrate environmental, sociocultural, and economic considerations.
4. The destruction of wetlands and other natural flood buffers has significantly reduced Miami-Dade's ability to mitigate storm surges and tidal flooding, increasing long-term risks.

Presenter(s): Nilver Tovar

Ghosts of Green Colonialism

The Sami Parliament President, Ailo Keskitalo, described the decimation of Indigenous land from wind farms as an act of green colonialism. These colonial policies exacerbated the loss of land from climate change (Normann 2020). Scholars began to utilise this term to conceptualise states placing the burden of the Green Transition and climate change onto Indigenous peoples, causing further marginalisation of groups across the globe. However, green colonialism did not arise alongside green new deals (GNDs). Indigenous groups have protested the construction of green, hydroelectric dams since the 1970s (Fearnside 2006). One of the most significant protests comes from Norway's Sami people. The Sami people protested the construction of the Alta Dam for nearly

a decade, occupying the proposed site from the late 1970s and into the 1980s. In constructing a dam, reindeer herding patterns used for generations would come to an end (Lehtola 2006; Lightfoot 2016). The Sami people are not alone in their experience of green colonisation. Throughout this piece, the experiences of green colonialism from across the globe will be examined to display a sustained effort by states to impose the energy needs of the majority onto Indigenous peoples. The research profiled will largely focus on the construction of hydroelectric dams and wind farms from the 1970s to present day. By creating an understanding of how green infrastructure is used to marginalise and force assimilation upon Indigenous peoples, one can make recommendations on how to build a sustainable future inclusive of all people.

Presenter(s): Jocelyn Bell

Landscapes of Care: Among The Ruins of Resilience and Climate Transition in the Aegean Archipelago

Across the hillsides of the Aegean Archipelago, the dry-stone terraces known as kserolithia stretch like the wrinkles of time. Built by hand over generations, they once sustained fragile ecologies, agricultural life, and seasonal uncertainty. Today, many lie in partial ruin, dislodged by time, tourism, shifting land use, and infrastructure transition. As the Greek state and EU usher in renewable energy transitions, including wind farms and energy infrastructure on these same hillsides, kserolithia structures re-emerge in public discourse as contested spaces where ecological, political, and vernacular knowledge systems collide.

This flash talk reflects on kserolithia as more than ruins or heritage remains. They are forms of endurance that challenge linear stories of resilience and decay. As climate infrastructures rise over the landscapes of kserolithia, their embedded meaning and materiality resist the narrative of progress through quiet forms of resilience – through encounters of care. They mark a different temporality and form of engagement – one where humans and non-humans act as co-agents in sustaining life.

This presentation asks us to reflect: How do we deal with the notion of ruin in times of transition? How can we trace resilience in landscapes of ruins and memory? How do we attend to what remains as a site of engagement with resilience and ecological life?

Presenter(s): Niki Xenia Alygizou

Perspectives on Conservation and Extraction in the Shiwiar Territory of the Ecuadorian Amazon

This paper will explore Shiwiar perspectives on conservation and environmental issues related to extractive activities in their territory. The Shiwiar are a Chicham-speaking Amazonian indigenous group primarily living in Ecuador. They are characterized as an "emergent" ethnic group, having developed as a distinct ethnic identity in the 1970s. The Shiwiar territory is one of the few indigenous territories in the Ecuadorian Amazon without road access. Recently, balsa extraction has increased in the Shiwiar territory. Based on fieldwork carried out in 2021, 2022, and 2025. I will outline ongoing Shiwiar participation in conservation programs and recent work with NGOs who are

providing economic support and infrastructure in Shiwiar communities. I will discuss Shiwiar attitudes towards conservation and their participation in extractive activities such as temporary work in petroleum, mining, palm oil, timber, and balsa industries.

Presenter(s): Travis Fink

Specters of Dispossession and Extraction: Remnants of the Hacienda Regime and Shadows of Large-scale Mining in the Peruvian Andes

Dispossession and labor extraction, but also resistance and reaction to them, have a long and diverse history in Peru, going back to colonial times and continuing throughout the republic. In the Peruvian Andes, the Hacienda regime instituted by the Spanish monarchy in the XVI century formally came to an end in the 1960's, but in some places like the Apurimac region it took until the 1980's to become real. Nowadays, the specters of gamonales or hacendados, the former owners of large land holdings expropriated to the Incas and its descendants, continue hunting peasant communities in ongoing conflicts about territorial ownership, but also reappear in the institutional and socioeconomic relationships that favor large-scale mining projects advocated by the Peruvian state in detriment of the rights of indigenous peoples. In the aforementioned region of Apurimac, the specters of the gamonales are joined by the opaque presence of transnational corporations that have taken over the same territories previously controlled by the haciendas, reshaping landscapes, economies and social expectations in rural towns and populations coexisting with them.

This presentation, based on ethnographic research conducted in the province of Cotabambas in the Apurimac region, analyzes the representations of peasant men and women from two rural communities affected –albeit in different ways- both by the Hacienda regime and by the open-pit mining project Las Bambas in the Peruvian Andes. The examination of their different trajectories and by changes in the scenery produced by the extractive mining project reveals complex and dissimilar forms of social and economic engagement, as well as diverse understandings of development and of modernization.

The Village is Stable: Understanding Risk Perception in a Barrier Island

Climate change is altering coastal landscapes rapidly by increasing the frequency and intensity of climate-related events. The increasing threat and impacts of climate change and disasters have sparked subfields of environmental anthropology-climate change anthropology and disaster anthropology-to investigate the increasing complexity of human-environment interactions. Some of the most adversely affected by climate change and disasters are small island communities because of their unique geographical and socio-economic characteristics. The isolation of these communities further complicates their ability to respond to and recover from disasters or weather-related events, as they often lack the infrastructure and resources necessary for effective disaster management and adaptation strategies. Ocracoke-a barrier island off the coast of North Carolina, USA-has been subject to environmental disturbance caused by previous disasters and climate

change impacts. The interplay between climate change and human systems is dynamic and non-linear, highlighting the need for targeted and culturally sensitive adaptation strategies. This ethnographic research study uses a community-engaged approach to understand risk perception and community identified risks in Ocracoke. Specifically, interviews and participatory risk mapping were conducted to assess differences in perceptions and impacts to community-identified risks, directly or indirectly related to climate change or disasters. Overall, this research identifies the most severe and common risks that need to be addressed in the community. The results from this study demonstrate the normalization of risk, as more risks were named in interviews than in the risk mapping data. Additionally, the findings indicated a significant variation in risks identified by participants, indicating the need for more cultural context in disaster and climate change preparedness and adaptation strategies. Emphasizing community perspectives can enhance adaptation strategies, specifically by providing insights to current perceptions and impacts of community-identified risks.

Presentation(s): Comfort Migrants or State Traitors? The Emotional Politics of Leaving Among Young Estonian Migrants

Since the European Union's enlargement in 2004, labor and educational migration has surged among young adult Estonians, particularly those of the so-called Y-generation, now mostly in their late 20s and 30s. Having grown up in a borderless Europe, these individuals often migrate in ways that are temporary, cyclical, and open-ended (Cairns 2021), a pattern described as "liquid migration" (Engbersen and Snel 2013).

However, public discourse in Estonia around migration has evolved amid social anxieties, leading to depictions of those who have left as "traitors to the nation"-individuals who benefit from higher salaries and better welfare systems abroad while abandoning their small and sparsely populated homeland. After politician Tõnis Lukas introduced the term "comfort migrants" in 2014, it gained traction as a social stereotype describing people who move abroad primarily for a more

comfortable lifestyle or improved economic prospects. According to this discourse, such migration is seen as driven by convenience rather than hardship, persecution, or war.

This paper examines how young Estonians living abroad negotiate these stigmatizing narratives of "comfort migrants" and "state traitors" in relation to their sense of national belonging. It draws on anthropological analysis of 50 oral interviews and open-ended responses from a large-scale online survey of over 2,000 participants—all of whom participated in the post-accession wave of emigration from Estonia.

While my research participants generally maintain a strong identification as Estonian, they do not view this identity as dependent on physical presence in Estonia; hence, their mobile lifestyles are not perceived as threatening to their national identity. Through the lens of "affective nationalism" (Militz and Schurr 2016), I argue that their sense of belonging is marked by "affective contradictions" (Toomistu, Annist, Murakas 2024), amplified by the stigmatizing discourses of "comfort migrants" and "state traitors." The ethnography of young Estonians abroad thus offers insights into the complex entanglements of global mobility, national identity, and populist nationalism, challenging the moral binaries that shape East-to-West migration narratives in the post-EU-enlargement era.

Haunted by Disease and Profit – Morality, Fear, and Traumatic Memory in the Policymaking around Plasma Donation in the EU

Land, livestock, natural resources are subject to careful regulation in the EU. They are considered 'strategic resources', economically important raw materials subject to a higher risk of supply interruption that pose concern for self-sufficiency. While human bodily resources are crucial raw materials for medicine, they have not been approached with the same attention. One such resource is blood plasma – a valuable raw material of pharmaceutical manufacturing – whose provisioning is envisioned through different models in the EU. Similar to the commercialized US system, some EU member states offer monetary compensation to plasma donors, while most others do not. This contrast was highlighted as the old Blood Directive (2002) regulating plasma donation entered a revision process. Lobbying around the new SoHO (substances of human origin) regulation revived buried discussions about gift-giving and commodification in relation to blood donation. Should the market or the public sector be responsible for sourcing plasma and life-saving medicines derived from it? Is it eventually a gift and/or a commodity?

This policymaking process mobilized diverse actors with different stakes in the outcome which can potentially reshape – or contrarily – solidify the supply chains of plasma which provide treatment for hundreds of thousands of patients in the EU. These include medical experts, representatives of the pharmaceutical industry and non-profit national blood centers and patient organizations. Policymaking is often imagined as a technical and amoral procedure; however, this ethnographic study reveals the way it gets saturated with affects, morality and ghosts of the past and various Others.

The debates around the SoHO revision were haunted by the dependence on the US (where the bulk of raw plasma for EU medicine production is imported from), envisioned as the dark mirror image of the EU where a market regime in plasma procurement (relying on paid donors) rules, and has the potential to "infect" the Union as well. The fear might not be unfounded: 'studying through' this process of policy-making, and 'the webs and relations between actors, institutions and discourses' that power creates (Shore and Wright 1997) revealed how 'market' and 'non-market' spheres are not easy to separate. Non-profit blood centers and for-profit pharma companies are intimately connected through the supply chain. Gift and commodity haunt each other. The policy revision process was further haunted by the collective historical trauma of the mass infection of people living with hemophilia by plasma-derived medicines in the 1980s in several EU member states. The (often unresolved) memory of blood-borne infections like hepatitis C and HIV still strike terror in policymakers and experts in the plasma field alike. This rearranges how risky donors are (re)imagined, how patients should be protected and cared for, and the nexus between these two end points of the plasma supply chain.

Presenter(s): Zsafia Bacsadi

Historical Predicament and Sovereignty after Russia's Invasion of Ukraine. The Baltic Case.

While Russia's war against Ukraine has been analyzed in terms of colonialism and imperialism, I suggest interrogating forms of sovereignty to understand discrepant geopolitical ideologies of statehood and violence in the region. I explore the way statehood has been conceived, authority deployed, violence explained, and dissension counteracted since 2014 in the Baltic states (my primary focus is on Lithuania) and Russia. Russia projects its legitimacy as a great power, represented internationally until the war of 2022 and historically as an empire and the winner of WWII; while the Baltic states legitimate their right to statehood by underscoring their illegal occupation during WWII by the USSR. I argue that Russia enacts supra-sovereignty, while the Baltic countries engage radical sovereignty to deter Russia and counteract a future of temporal and limited statehood that was their historical predicament in the 20th century. Based on my ethnographic research in rural and urban communities in Lithuania, I claim that there is certain relativity how people imagine sovereignty, but it is not reducible to language (as in Russia's protection of Russian speakers), nor even ethnicity (as in Russia's discourse that there are many Russians in Ukraine, Latvia, etc.), or nationhood. While people recognized temporalities and limits of sovereignties, none of them wanted borders to move again.

Presenter(s): Neringa Klumbyte

The (Infra)Politics of PTSD in Post-Conflict Croatia

For years, I avoided writing about PTSD. Despite its ghostly omnipresence in my doctoral research on mental health policies in Croatia, the topic felt too close, too heavy, too politically charged. It was easier to leave drafts unfinished than to confront the weight of a clinical category, political discourse and a deeply personal reckoning. It was only through therapy-first individual, then group- that I found a way to articulate the unspeakable. This process, however, did not bring closure;

rather, it underscored the layered silences surrounding PTSD in post-conflict Croatia, where trauma is both hyper-visible and invisible.

This paper examines PTSD not as a medical diagnosis but as an (infra)political phenomenon, shaped by the unspoken burdens of those who grew up in the shadow of war. Drawing from autoethnographic reflection, I explore how trauma is processed within intimate spaces, such as therapy, while remaining unspeakable in public discourse. The dominant narrative in Croatia situates PTSD within the figure of the war veteran, leaving civilian trauma, intergenerational suffering, and experiences like my own-of secondary PTSD-largely invisible. Through the lens of James C. Scott's concept of infrapolitics, I interrogate these hidden transcripts of trauma and the cultural constraints that dictate when and how suffering can be acknowledged.

Engaging with the work of Veena Das, Arthur Kleinman, and Peter Locke, this paper critiques the depoliticization of PTSD in biomedical frameworks and reveals how it is embedded in structural violence, generational silence, and socio-political transition. Speaking about PTSD-my own and that of others-remains fraught with hesitation and risk. Yet, breaking these silences, even in partial and imperfect ways, is necessary to move beyond the confines of the diagnostic label and towards a deeper understanding of trauma as a lived, collective, and political experience.

Presenter(s): Jelena Kupsjak

Unwelcome Ghosts. Dewhitening the Memories of the Anti-AIDS Movement in Mainland France.

The invisibilisation of the participation of poor, non-white people in the Anti-AIDS movement has been analysed particularly in the United States (Schulman 2012; Royles 2020). This proposal takes the French universalist colourblind context as a case study to analyse how memories of the Anti-AIDS movement are haunted by the ghosts of immigrants. This proposal is based on the observation that cinematic, visual and literary representations of the 'plague years', their deaths and forms of activism are part of a whitening of AIDS memory in France. The aim is to document how conflicting non-white memories of AIDS are transmitted from one generation of AIDS activists to another.

This proposal is part of the 'hauntological turn' in anthropology (Keck 2024), which seeks to understand how the living live with their ghosts and what social, symbolic and political uses are made of these ghosts (Gordon 1997; Delaplace 2024). In the field of HIV/AIDS, a large body of literature has documented living with HIV or the consequences of the virus in affected communities in terms of militancy, solidarity, mourning rituals, etc. However, little work has been done on the long-term experiences of the survivors of this brutal epidemic and on the place occupied by the ghosts of those who have died of AIDS.

Drawing on association archives and interviews with non-white AIDS activists in France, the research aims to see how current AIDS activists and LGBTQI+ activists inherit the non-white specters of AIDS. While AIDS deaths were not part of the collective memory during the so-called plague years, the fight against AIDS (Chantraine 2021) has been patrimonialised by institutions over the last decade. Place des combattantes du sida inaugurated in Paris on 1 December 2021,

Promenade Cleews Vellay; the memory of AIDS is gradually being incorporated into cities and cultural productions, such as successful exhibitions and films. The white ghosts of AIDS are beginning to be eligible for public mourning (Butler 2004), collectively mourned and commemorated with plaques in museums and urban spaces. Instead, absent from these public commemorations, the immigrant spectres of AIDS continue to remind us of the repressed and unresolved social violence (Gordon 1997) experienced by immigrant AIDS victims.

“Something’s cooking”: Piecing together the geopolitical present through plane/ship-spotting from Gibraltar

This flash presentation focuses on an aspect of my doctoral research exploring how the event of Brexit shapes the cultural politics of Gibraltar. Despite its electorate voting 96% in favor of remaining in the European Union during the United Kingdom's 2016 EU membership referendum, Gibraltar - a British Overseas Territory - finds itself subject to ongoing treaty negotiations between the UK and the EU which aim to open the land-border with neighboring Spain - an EU member state which also maintains a disputed sovereignty claim over Gibraltar. In this presentation, I consider how everyday activities of Gibraltarians demonstrate ways of responding to the present conjuncture of contested sovereignties and of converging borders. Drawing upon the recreational activity of ship and plane-spotting carried out by maritime and aviation enthusiasts residing in Gibraltar, as well as the dissemination of videos and photographic evidence of sightings across social media, I posit that ship and plane-spotting as a recreational activity can be understood as a mode of everyday bordering and political-self-determination within the context of Gibraltar where the territorial waters and airspace of Gibraltar are contested by Spain. By focusing on how maritime and aviation enthusiasts patrol Gibraltar's maritime borders and airspace, I argue that ship and plane-spotting is a way in which Gibraltarians, as a non-sovereign people, participate in the geopolitical present that is driven by sovereign states.

5413 Technocratic Imaginaries and the Politics of Labor's Visibility

Start Date: 11/21/2025 12:45 PM **through** 11/21/2025 2:15 PM

Venue: Marriott **Room:** Bonaparte

Type: Roundtable/Town Hall

This roundtable explores how different forms of labor-technical, affective, and infrastructural-are made visible, obscured, and weaponized within technocratic and political regimes. Highlighting newly published books in conversation with works-in-progress, the discussion attends to the power dynamics that determine whose and what labor is acknowledged, esteemed, or rendered invisible and to whom the value of such labor accumulates.

Some participants focus on marginalized, racialized, and gendered labor that is strategically obscured. Others explore how material infrastructures, data practices, and the operations of big tech are either rendered invisible or, at times, hypervisible in ways that shape both workplace hierarchies and the contemporary political landscape. The roundtable also examines how different people and communities navigate the socio-political landscapes shaped by infrastructural and technological developments. These broader shifts can sometimes normalize surveillance or, at other times, be harnessed in the pursuit of fame.

Together, presenters invite reflection on how we come to recognize labor as labor, under what conditions and what regimes of visibility, and what labor can do within the technocratic imaginaries that narrate the structuring of our material, social, and political worlds.

4896 Part 2: Queer Demography: Thinking Sexuality, Gender, and Kinship in an era of Population “Decline”

Start Date: 11/21/2025 12:45 PM **through** 11/21/2025 2:15 PM

Venue: Marriott **Room:** Galerie 1

Type: Oral Presentation Session

Over the past two decades there have been mounting transnational demographic transformations related to low fertility rates, decreasing marriages, and greater economic interdependence with immediate kin. In the afterlife of neoliberalism and austerity, the lines among wage labor, welfare, and kinship are being redrawn (Martin, Wig, and Yanagisako 2021) and new politics of dependence, personhood, and survival are emerging. This panel asks after the place of sexuality, gender, kinship,

and normativity amidst the socio-economic changes wrought by demographic "declines." How do pronatalist state policies and other "demographic anxieties" (De Zordo, Marre, and Smietana 2022) affect queer and trans reproductive politics and family formations? What new forms of subjecthood, survival and kinship emerge as individuals negotiate newfound economic and social dependencies? What do demographic changes mean for hegemonic notions of "straight time" (Wool 2021; Boellstorff 2007) which stipulate economic independence as a pre-condition for a heteronormative life? What subjects become "queered" (Weiss 2022) under these conditions, beyond queer and trans populations? How do age, race, legal status, disability, and other dynamics intersect these processes?

Our panelists collectively seek to address these and related questions through ethnographic research situated in diverse cultural and social milieux. Part 1 of this panel explores relationships between demographic shifts and reproductive politics, critically examining the ways changing reproductive hopes, imaginaries, and foreclosures shape individual, collective, and national horizons of futurity. Part 2 of this panel relatedly focuses on demographic change and transformations of intimacy and kinship, especially those which complicate discreet identity categories and conjugal relationships. Beyond a focus on "queer" as a marker of just non-normative desires and subjectivities, our panelists collectively explore "queer" relations and connections that exceed fixed domains and normative frameworks- in the process opening new epistemological, relational, and theoretical vistas into demographic change.

Presentation(s): Fugitive Kinships: Wayward Lives and Queer Bonds of Filipina Migrants in Japan

Japan, the nation-state with the oldest population in the world, has long relied on the labor power of foreign migrants while officially disavowing their presence by insisting that the country has no "immigration policy." In reality, many immigrants have settled there over the last several decades by resorting to kinships to citizens, including the Filipinos—of whom roughly 70% are women. Many initially arrived on the temporary "entertainer" visas and subsequently settled by marrying Japanese men and/or bearing Filipino Japanese offspring. The hinging of mobility on family ties, however, has yielded a messy by-product: fugitive kinships—bonds formed outside the juridical definitions of family, typically without legitimate documents or state sanction, that sustain their vitality not by open defiance of the exclusionary rules but by quiet maneuver of the system in place. By tracing the transnational history of Japan and the Philippines that seeps out of the ethnographic portraits of Filipina migrants, this paper elucidates two manifestations of fugitive kinship: transacted marriages between Japanese men and Filipina women, and queer kinships formed in gay, lesbian, and asexual

relationships. By elaborating on queer relations that evade the state's gaze, the paper analyzes how the duality of fugitive kinship—that is, the bifurcation between public acceptance and private subversion—gives the state more leeway for two-faced engagement with those on the margins of citizenship.

Love, Gangnam Style: What Gendered Constructions of Romantic Love Reveal about Marriage and Fertility Decline in South Korea

South Korea's economic transformation in the 20th century has been as miraculous as its declining fertility rate is potentially catastrophic. Korea's political leaders and populace's default explanation for why their fertility is the lowest in the world is the rising cost of living and of raising children. In this paper, based on over two years of ethnographic fieldwork in South Korea accompanied by interviews with 75 individuals and 250 survey responses, I argue that transformations in expectations of romantic relationships and gender relations are key factors shaping Korea's declining marriage and fertility rate. In particular, I analyze Koreans' conceptions of romantic love and courtship narratives to illustrate how expectations of marriage have become more companionate and individualized and how the rapid transformation of gender relations in Korea has created points of gendered friction for couples. One specific source of gendered friction is women's concerns about expectations of sacrifice and gendered reciprocity, which particularly come to a head as romantic relationships transform into kinship relationships through marriage. Relative to men, hegemonic norms of gendered reciprocity pose a greater threat to emerging individualized constructions of self among middle class young women. These hurdles to reconciling aspirations for independence, self-actualization, and class reproduction contribute to delayed or forgone marriage and, by extension, fertility.

Queering Voluntary Childlessness and Emerging Masculinities Among Young Heterosexual Men in Québec

As in many parts of North America, fertility decline in 20th-century Québec was swift and dramatic. Among French-Canadians, high fertility was associated with French linguistic and cultural survival in a context of Anglophone political and economic dominance. Current fertility rates in Québec are well below replacement levels, and a growing number of young people in the province are explicitly stating their intentions to eschew biological reproduction altogether. Approaching voluntary childlessness with and through debates around queer (non)-reproduction and masculinities sheds light on how young heterosexual men imagine and foreclose their individual and collective futures. Based on ethnographic research among young, cis-gender, heterosexual French-Canadian men in Québec, I examine how voluntary childlessness does and does not "queer" masculinity, kinship and nationalism. While my informants and those who describe them often invoke climate change and the individual choice to not transmit life on an uninhabitable planet as their primary motive of voluntary childlessness, other factors shape these men's non-reproductive imaginings. These

include fears of perpetuating toxic masculinity and domestic violence, anxieties about the looming spectres of economic duress and privatized childrearing, and desires to contribute to more equitable gender relations.

Presenter(s): Pierre Minn

Crafting Queer Kin Through Sterilization

At a moment when pronatalist perspectives hope to address declining fertility rates through heteronormative reproduction, why are an increasing number of people seeking sterilization? What does sterilization offer as a means of not just foreclosing reproduction, but also creating other kinds of community and connection? In this paper I build on the work of scholars who show that kinship definitions are transformed through studies of sexual and reproductive choice (Westin, 1991), assisted reproductive technologies (Strathern, 1992), disability (Rapp & Ginsburg, 2011), and non-heteronormative Indigenous relations (TallBear, 2018) to ask what kinds of kinship emerge through contraception. How might undergoing sterilization at this moment in U.S. history enable individuals to creatively reproduce desired forms of relatedness and belonging? Through ethnographic research in Chicago foregrounding the perspectives of those seeking sterilization, I posit that individuals make reproductive decisions not just to satisfy personal preferences to stop having children but also to bring about the collective queer futures they envision – as part of a world-building strategy that affects not only their reproductive capacity but also their community and kin relations, thereby extending the understanding of queer kinship and demography to include acts of deliberate nonreproduction via sterilization.

Roommates or Romance? Polyamorous Potential for Achieving Financial and Kinship Aspirations

Through growing engagement on social media, polyamorous Americans offer positive representations of their nuclear family alternative while providing emotional and logistical support for those looking to create a polyamorous household. Meanwhile, mainstream humor related to polyamory has shifted. Rather than mocking polyamorous people, the jokes are increasingly economic in nature, with quips about how multiple romantic partners are needed to afford housing. Together, these media shifts present a picture of a changing public opinion as everyday financial and domestic labor needs become more difficult to fulfill. In an era of decline for the nuclear family, polyamory is gaining acceptance in the U.S. as a legitimate family structure with financial advantages.

This paper expands on our 2024 digital ethnographic study of online polyamorous communities, in which we analyzed how polyamory offers new opportunities for participation in social reproductive processes during a time of increasing economic instability. We explore tensions between financial strain and the societal emphasis on romantic relationships as the foundation of home-building. For individuals seeking to establish their own households, roommates can feel like an "immature" stop-gap option – even for those who already have romantic partners or children. Through queering

approaches to cohabitation, we show how polyamorous households offer a strategy of family formation for Americans under continuous economic crisis.

2731 Ghostly Grounds: Semiotic Erasures and Haunted Meaning

Start Date: 11/21/2025 12:45 PM **through** 11/21/2025 2:15 PM

Venue: Marriott **Room:** Galerie 2

Type: Oral Presentation Session

"Haunting" is a process characterized by the variably apparent and sometimes inescapable presence of what is not there. We are interested in what hauntings are happening during semiosis, and how tracing semiotic ghosts-indexical relations that influence meaning-making, but are often overlooked, whether accidentally or on purpose-can help acknowledge the ongoing impacts of these sign relations. Irvine and Gal (2000) theorize "erasure" as a process in which elements that contradict a given language ideological framework are invisibilized. Extending this concept beyond language ideologies, we understand semiotic ghosts as the enduring presuppositional force (Silverstein 2003) of what was erased, which is unequally available for potential citation and transformation. Papers in our panel engage with semiotic ghosts in a variety of contexts: Tekin looks at how a fungus is made legible as an Indigenous food or "ancestor" through the multisensory summoning of its erased indexical relations; focusing on an Afro-Caribbean neighborhood in Puerto Rico, Castro Font analyzes how spectral traces of its past and present materialize through the sensorial sphere; Motobayashi analyzes the haunting of a post-national speakerhood in the formation of a cosmopolitan language policy in Japan; Khoshsirar traces strategic acts of indexical erasure as a "ghostly infrastructure" in the teaching of a Persian mystical text; and Heffernan highlights the use of entextualization in an experimental musical work to creatively interrogate hauntings in processes of interpretation in trans voice therapy.

Presentation(s): Phonetic Summoning: Making Huitlacoche's Indigenous Relations Legible Through Multisensory Naming Practices

Huitlacoche is a contested fungus that has long coexisted with corn; it's an ancestral food for some Indigenous peoples of Abya Yala, a "traditional food" in Mexico, a smut pathogen for U.S.

agricultural institutions, and "corn truffle" for U.S. restaurateurs. Based on ethnographic fieldwork with diasporic Indigenous organizers in San Diego who lead cooking demonstrations sharing the "Indigenous story" of huitlacoche, this paper examines how these organizers summon its suppressed Indigenous relations through the conscientious voicing of the Nahuatl phonemes in its name. Organizers frame huitlacoche's limited availability in the U.S. as a result of its "demonization" within industrial agriculture, claiming that both its pathologization and commodification are cases of "Indigenous erasure," as renaming the fungus as smut or truffle obscures the semiotic possibilities of its Nahuatl name. At the intersection of this context and the multisensory elements of these demonstrations—where participants smell, view, touch, and taste the fungus—emerge qualic possibilities that summon the semiotic ghosts of its Indigenous relations. Through these events, sonic qualities of "huitlacoche" or "cuitlacoche" become familiar to participants alongside the fungus' sensorial qualities, suggesting that renaming it "corn truffle" is not necessary to make it palatable, but instead ghostifies the semiotic relations that make it legible as an Indigenous material and/or "ancestor."

Aquí Vive Gente y el Derecho a Permanecer: Language, Materiality, and Collective Tenure in Puerto Rico

Puerto Rico's financialization of the economy in the 21st century has worsened the material living conditions of everyday life and is a driving force of the concerning steady decline of the local population since 2015. These political economic effects are magnified in Santurce, an Afro-Puerto Rican and Dominican working-class neighborhood in San Juan, turned magnet for tourists and real estate speculative investors. Using a semiotic and linguistic anthropological lens, this paper engages with "semiotic ghosts" to analyze the ways in which Santurce's past and present—anchored in Caribbean blackness and aurality—are simultaneously erased yet often taken up for citation through the sensorial sphere. Historically, Santurce has been a key site of cultural production as well as a target of political economic experimentation. This paper focuses on Calle Loíza and Calle Cerra, San Juan's designated Cultural and Gastronomic Center and Arts District respectively. More broadly, I draw from ethnographic fieldwork to discuss the linguistic and aesthetic practices that Santurce's organized communities employ as strategies to enact permanencia (permanence) and forge alternative politics to shift their material living conditions.

A Semiotic Ghost in the Promotion of International Japanese: Antithesization of the National and the Cosmopolitan in Language

This paper reports on a discourse analysis of Japan's language policy, called the JF standard, which is a pedagogical guideline for international promotion of the Japanese language. Focusing on the JF 2007 report that has documented the series of exploratory discussion on the foundational vision and principles of the JF standard, the analysis has been conducted from the perspective of the metapragmatics of language policy processes and examined the representation of the language to

be promoted internationally and of its international speaker population. This paper pays particular attention to the process in which the concept of *kokugo*, a Japanese term that literally translates as national language, is cited as an antithesis in creating the image of cosmopolitan Japanese. The antithesization of *kokugo* as the national language, which contributes to legitimizing a form of cosmopolitan ideology of language in the document, includes processes of re-appropriation and erasure of certain indexical relationships of *kokugo* that haunt the discourses surrounding 'cosmopolitan language.' The 'ghostly' aspects of antithesization will be unpacked in this paper, specifically how the rhetoric that cites *kokugo* as a traditional and modern language ideology and as something the new and cosmopolitan language use is 'not confined to,' contributes to the framing of the language and speakers in the policy discourse of international language promotion.

Presenter(s): Kyoko Motobayashi

"We Do Not Believe This": Indexical Shadows and the Ghostly Labor of Secular Reading in Persian Mystical Pedagogy

This paper examines how an online instructor's systematic omissions and disavowals of religious content in teaching 'Attār's *Manteq al-Teyr* (The Conference of the Birds) in Iranian mystical circles in Los Angeles reveal the ghostly labor of secular reading—where ideology operates most powerfully when obscured. Through analysis of strategic elisions (e.g., skipping prologues on divine unity) and explicit negations (e.g., rejecting the Prophet Muhammad's *mi' rāj* [ascension]), I argue that these pedagogical acts stage indexical erasure, wherein religious significations are simultaneously invoked and disavowed to construct a secular-critical framework. The instructor's interventions—such as reframing the piety of the Duck (a key avian character in 'Attār's allegory) as clerical hypocrisy while suppressing its Sufi connotations—exemplify indexical denial (Barrett & Hall, 2024), where the disavowal of alternate meanings sustains ideological labor. Drawing on literature of semiotic processes (Irvine & Gal, 2000; Silverstein, 2003), I demonstrate how this pedagogy depends on ghostly infrastructures: the omitted prologues, the negated *mi' rāj*, and the Duck's unspoken Sufi resonances persist as structuring absences, their erasure enabling the coherence of secular critique. The paper ultimately reveals a central paradox: ideological efficacy hinges on spectrality—the mechanisms of meaning-making must remain perceptible only through the traces of what they disappear.

Entextualization and Reconfiguring Participant Frameworks: Analysis of a Multimedia Artistic Work on Trans Voices

This paper explores how an experimental music piece creatively deploys entextualization and reconfigures participant frameworks to interrogate processes of semiotic interpretation in trans voice therapy. Situating my analysis within broader ethnographic research on English-language trans voice therapy in North America, I argue that composer Sarah Hennies' hour-long multimedia work, "Contralto" (2017), underscores the inescapable referentiality that haunts utterances removed from their context of origin and taken up as ostensibly contextless vocal exercises used to

assess sonic qualities. Devising an immersive encounter with transfeminine voices through sound and video, the piece brings attention to the interactional elements of voice modification, implicating the audience as witnesses and addressees in such practices. Shifts in musical style and intensity of the string and percussion accompaniment in the piece occur alongside shifts in interactional dynamics as speakers animate multiple voices, forging a polyvocality that obfuscates clarity of authorship and address. In highlighting multiple layers of entextualization—from imagined everyday women's language, to pedagogical text, to artistic performance—"Contralto" enables the (re)emergence of erased semiotic relations (legible to some more than others) that comprise ideals of gendered linguistic practice and embodiment.

3991 The Way That Leads Among the Lost: A Conversation With Angela Garcia

Start Date: 11/21/2025 12:45 PM **through** 11/21/2025 2:15 PM

Venue: Marriott **Room:** Galerie 3

Type: Roundtable/Town Hall

Angela Garcia's newest book, *The Way That Leads Among the Lost: Life, Death, and Hope in Mexico City's Anexos* (published in 2024 by Farrar, Straus, and Giroux), takes us into the worlds of anexos, informal addiction clinics in Mexico. As controversial as they are widespread, anexos are infamous for applying disciplinary tactics and violence to treat addiction, often against participants' will. Through searing portraits, Garcia introduces us to some of the numerous Mexican mothers who commit their children to the anexos. This paradox – of a mother's love expressed through and as violence – unveils the multiple forms of injury that the urban poor in Mexico are enmeshed in and the impossible decisions they face. Garcia shows us that they often see anexos as spaces of safety from the narco war, fueled by government neglect and US policies. Through patient and caring ethnography, Garcia unearths gestures of beauty and care exchanged daily by participants in anexos who weave a community built upon shared experiences of suffering.

This book is a daring work, both personally and intellectually. As Garcia exposes herself to the anexos and their therapy treatments, she practices an ethnographic discipline that forms the sensory grammar at the base of this project. One of the most stunning dimensions of the book is that it is part-memoir. Garcia unveils her own family story about addiction, family abandonment, and mother-daughter relationships in stream-of-consciousness fragments that create a precise and elegant counterpoint with the ethnographic text. The author relies on precisely chosen details and references to perform the work of analysis.

In this roundtable, participants are invited to consider the resonances that this book might have with their own regions of thought in relation to questions of ethnographic writing, violence, borders, war, and motherhood.

3659 Collections Lessons: Teaching and Learning through Collections (Part 1)

Start Date: 11/21/2025 12:45 PM **through** 11/21/2025 2:15 PM

Venue: Marriott **Room:** Galerie 4

Type: Roundtable/Town Hall

This roundtable will share successes from recent experiments with collections-based learning, while reflecting critically on the pedagogical, logistical, and ethical challenges involved in bringing an "object-based" or "collections-based" focus to teaching and learning. Our discussion will be positioned alongside current efforts to decolonize anthropology museums and collections.

Object-Based Learning approaches, often grounded in multisensorial and experiential learning pedagogies, have been proposed as encouraging active learning in formal education settings (Chatterjee and Hannan 2015, Adams 2015, Kukhareva et al. 2020). Logistically, teaching and learning with collections often presents special challenges as it requires either bringing a group of learners into a museum or bringing its collections to the learners. Ethically, this approach can be problematic where it reinforces learners' authority to analyze and interpret other communities' cultural belongings, privileging the colonial gaze over the stories and voices of makers and owners of the items exposed to study (Schultz 2019, Hodge 2018).

In this two-part roundtable, we discuss collecting and curating as learning strategies that cross boundaries between museum, classroom, and community. Presenters in this session have worked with objects and collections as part of their classroom teaching in diverse areas including art (Vunidilo), archaeology (Fernstrom), and Indigenous curation (Pauliot). Several of us have created spaces for learning alongside contemporary artists and community members, for example by embedding a team of Indigenous Australian artists in an undergraduate museum studies seminar (Thorner), or by working with undergraduate anthropology students and Indigenous designers to acquire new works for a university museum (Thrift).

These and other experiences invite us to ask: What criteria and best practices can we put forward for effective, pedagogically sound, and ethical teaching and learning through anthropology collections? How can we ensure that Object-Based Learning is properly grounded in the broader perspectives and methods of anthropology as a discipline, including sensory anthropology and "engaged" approaches? And how can we ensure that our collections-based teaching and learning, in museums or in the community, contributes to decolonizing anthropological museums and education?

7210 'Deplorable' Anthropology: Trump, MAGA and Anthropology's New Repugnant Cultural Other

Start Date: 11/21/2025 12:45 PM **through** 11/21/2025 2:15 PM

Venue: Marriott **Room:** Galerie 5

Type: Oral Presentation Session

This panel brings together ethnographic studies that explore the affective, religious, and communicative contours of contemporary conservative and right-wing mobilizations in the United States and beyond. From far-right Christian separatism to vaccine skepticism, from the adoption of insults as markers of political identity to a dialogic understanding of Trumpism, these papers examine how mistrust, identity, and perceived catastrophe produce novel modes of political engagement. Taken together, the panel interrogates how participants in Trumpist and adjacent movements navigate contradictions-between governance and ungovernability, liberty and authoritarianism, belonging and alienation-through embodied practices, transnational imaginaries, and rearticulations of truth and legitimacy.

Riccardi-Swartz explores how far-right Christians in the American South envision becoming "ungovernable" through transnational alliances with post-Soviet Russia, framing democracy as a catastrophic threat to white Christian civilization. Richlin examines the medical freedom movement in Maine, showing how Covid-era vaccine skepticism has fueled new political alliances between former leftists and far-right actors, rooted in a broader sense of institutional betrayal. Hinton revisits his earlier work on white power and genocide to assess the heightened threats posed by Trump's second presidency, as MAGA rhetoric increasingly embraces soft authoritarianism and violent extremism. Zandstra analyzes how Trump supporters and other global right-wing movements repurpose derogatory labels into political identity, a phenomenon she terms "contestatory identity positioning," which complicates efforts to challenge their narratives. Finally, Thompson offers a dialogic approach to understanding Trumpism, focusing on how certain political beliefs "make sense" to supporters when viewed through the lens of polarized media ecologies and as a dialogic product.

Together, these papers provide grounded insights into how the affective, religious, and communicative dynamics animate contemporary far-right and conservative imaginaries and help to shape right-wing and conservative political subjectivities. In the process, these papers also

highlight two ideologies that sustain highly consequential political sodalities in liberal democracies today (illiberal though they might seem), namely, race and religion. These studies aim not only to analyze but also to understand the inner logics of these movements, raising critical questions about the future of democracy, social cohesion, and political discourse in an increasingly polarized world.

Discussant: Jacob Hickman, Brigham Young University

Presentation(s): It Can Happen Here 2.0: White Power, MAGA, and the Rising Threat of Violence in the U.S.

Drawing on ethnographic research on U.S. political culture and Donald Trump's "Make America Great Again" (MAGA) movement, this paper examines the logics of the MAGA movement, how its future-oriented messaging is rhetorically packaged and driven, and how the movement poses a variety of threats to democracy and stability in the U.S., ranging from soft authoritarianism and white power extremisms to violence against groups like undocumented immigrants and the transgender community -- both of whom are reviled and demonized in MAGA rhetoric. In doing so, the paper reconsiders the author's book, *It Can Happen Here: White Power and the Rising Threat of Genocide in the US* (NYU Press, 2021), which was centered on Trump's first term. There are important continuities between Trump 1.0 and Trump 2.0, but the threat is now greater and following a very clear plan to erode traditional checks and balances, expand executive power, and undertake related initiatives detailed in documents like "Project 2025."

Presenter(s): Alex Hinton

Proud Deplorables, Vile Vermin, and Local Foreigners: Contestatory identity positioning in Trumpian politics and around the world

During the 2016 presidential campaign, a notable element of the pro-Trump movement was his supporters' defiant coopting of opponents' negative characterizations of them—what I call contestatory identity positioning. This paper shows how the MAGA movement has turned disapproving rhetoric about Trump and his followers into a badge of pride, helping to fuel Trump's electoral victories in 2016 and 2024 and confounding expectations that Trump would soon disappear from the political scene. I consider contestatory identity positioning in a broader geopolitical context, pointing to analogous cases from 20th-century British politics and more recent examples from Catalonia and lowlands Bolivia. I ask what social and political conditions may favor the adoption of contestatory identity positioning and why discourse constructing such a position has been notoriously difficult to counter. Finally, I consider to what degree this kind of

identity work continues to characterize the MAGA movement, with examples from the Biden years and the 2024 electoral campaign.

Presenter(s): Anita Zandstra

“Become Ungovernable:” Covert Tactics, Racism, and Catastrophe

Considering racialized theo-political ideas espoused by far-right Christians in the American South, this paper looks at their paradoxical need for social-moral securitization through nationalist policies and government policing in relationship to their anti-democratic desires to become ungovernable as citizens of heaven. Exploring the notion of an imperiled Christian civilization at the hands of "deep state" elites, this paper shows how far-right Christian anxieties over the "catastrophe" of democracy apocalyptically lead to covert sociopolitical tactics aimed at liberating the far-right self from the assumed system of Western liberal oppression. In tracing this out, I look at how post-Soviet Russia becomes a salvific geo-political possibility for those fleeing ideological cartographies of assumed white Christian marginalization in the United States. Utilizing ethnographic data and media analysis, I show how transnational, digital flows of religiosity and racism are co-constituted in the illiberal dramaturgy of white panic and mythos of ungovernability that draws together actors from the American South and Putin's Russia into a global imaginary of anti-democratic political possibilities for disaffected people.

Presenter(s): Sarah Riccardi-Swartz

The Politicization of Mistrust: The Rise of Medical Freedom Activism in the wake of Covid-19

Drawing on ethnographic research based in Maine from 2024-5, this paper considers the culmination of contemporary institutional and medical distrust in the wake of Covid-19: the rise of the medical freedom movement and its subsequent convergence with Trumpism. Based on ethnographic data from community meetings, retreats, interviews, and congressional hearings, I analyze the politicization of post-Covid-19 vaccine skepticism and the broader medical freedom agenda such sentiment informs. Furthermore, I consider how vaccine suspicions index broader currents of pervasive distrust, paranoia, dread, and betrayal that help contextualize the return and resurgence of Trumpism. The paper details how groups with formerly left-leaning memberships rationalized alliances with varied far-right, anti-government, Christian nationalist, and anti-LGBTQ organizations including Moms for Liberty and Gays against Groomers.

In keeping with trends across the U.S., the question of vaccination remains deeply politicized in Maine. In 2019, Maine eliminated non-medical exemptions from school vaccination requirements by legislative action and referendum. In subsequent legislative sessions, state medical freedom organizations have introduced bills intended to reinstate such exemptions and eliminate vaccine mandates for healthcare workers. To date, these efforts have mostly failed, but activists feel renewed optimism given Trump's elevation of RFK Jr. and other outspoken vaccine skeptics to positions of n

Presenter(s): Johanna Richlin

“Make it Make Sense”: Understanding Trumpism as Dialogic Relation or Trumpism in Interaction

In this paper, I seek to understand Trumpism in dialogical terms, not as a sui generis political movement created ex nihilo but rather as a response to a conversation – a political movement birthed by a particular political and media ecological milieu. The task undertaken here is to understand how Trump "makes sense" to approximately half of the American electorate. This involves "taking seriously" the perspective of mainstream Trump voters/supporters. Here I consider politically polarizing events of dialogue and their uptake and circulation in media (social and otherwise), including: (unsupported) claims, circulated by no Vice President J. D. Vance, that Haitians are eating their neighbors' pets in Ohio; the Trump administration's claim that DEI was responsible for the FAA's failure to stop a plane from crashing into a helicopter; and an older but instructive example involving Trump's press secretary's failure to say that Trump disavows White Supremacy. The aim of this research is to do what anthropologists have long been good at doing, namely, offer an understanding of a people's behavior that does not reduce them to mere social scientific explanans but which instead understands the logic of that behavior in terms recognizable to them. Far from being an endorsement of these positions, as Harding (1991) noted, this approach can enable new means of political engagement.

Presenter(s): Greg Thompson

Discussion

4050 Articulating Race and Capital: Building Anthropologies of Racial Capitalism

Start Date: 11/21/2025 12:45 PM **through** 11/21/2025 2:15 PM

Venue: Marriott **Room:** Galerie 6

Type: Oral Presentation Session

Loïc Wacquant has challenged scholars of racial capitalism to demonstrate, rather than assume, how race and capital are articulated in specific contexts. Following Stuart Hall - and separating a little from Wacquant - this panel session will collectively argue that such articulations are historically contingent. That is, how race and capital come together to legitimise specific modes of expropriation, exploitation and accumulation is connected to the way in which political projects and ideological formations dominate at a specific time - for example in producing and cheapening 'racialised' populations whose labour is super exploited and whose resources are expropriated.

This panel will undertake ethnographic and historical interrogations of the relationship of race to capitalism (and vice-versa). We are particularly interested in how articulations of race and capital are actively produced, reconfigured, and contested in concrete social formations. Political projects and ideological formations seek to shape this articulation - papers in this panel pay attention to the material ways in which power plays out to forcefully create conditions of possibility for racialised forms of exploitation. Conversely, papers will also focus on the political struggles against this - pointing to counter-movements and forces.

Papers in this session engage with these questions through a variety of perspectives and questions, including but not limited to:

- Historical and contemporary entanglements: How do specific articulations of race and capital connect (or fail to connect) past formations-such as colonial economies-with present-day social, economic and racial structures?
- Beyond the Global North: How do race and capital articulate in contexts that are underrepresented in current scholarship? What does this reveal about the global variations of capitalism itself?
- Capitalism as a dynamic social formation: How does examining the articulation of race and capital help us understand capitalism's ethical, political, and cultural dimensions, beyond its economic logic?
- Social reproduction and race/capital articulations: How does the way race and capital articulate hinder some social reproduction projects and facilitate others? What are the modes of subjectivation that specific race/capital articulations seek to bring about?
- Theories of value: How do particular articulations of race and capital shape or challenge anthropological understandings of value?

Presenters engage these questions by drawing on anthropological and historical methods to offer grounded and processual accounts of the articulation of race and capital. By focusing on specific cases, we aim to deepen the conversation around racial capitalism, challenging static or deterministic interpretations and opening space for more nuanced, relational, and conjunctural approaches.

Presentation(s): The re-emergence of “real” racism in Cuba: An anthropological analysis of the articulation of race and capital in contemporary Centro Havana

Socialist Cuba is usually seen as a vanguard in the fight against the imperialism of capital and race. Scholarship on the combined workings of capital and race within contemporary Cuba is therefore scarce. The hegemony of finance capital in the neoliberal era, however, has been transforming

social relations in Cuba too. I will argue that current debates on the increasing "racial inequalities" and "institutional racism" of Cuba's "Special Period" do not take seriously enough the articulation of capital and race because they build on a poststructuralist consensus in race theory, emanating from the US, where race is seen as ultimately an ideological force and political economy as merely the setting within which this force is asserted and resisted. Instead, this paper builds on theories of race as a material force that is co-constitutive of labor exploitation and value regimes under capitalism: "real" (as opposed to formal) racism. By ethnographically analyzing the way social relations are changing in the neighborhood of Centro Havana under pressure of global capital, I will demonstrate that current conditions for an increased racialized exploitation of vulnerable groups in the neighborhood are being produced not by race itself but by the articulation of capital and race.

Presenter(s): Luisa Steur

Border Infrastructures under Racial Capitalism: Detention, Deportation, and Abandonment in South Africa

This paper explores the concept of border infrastructures under racial capitalism with specific focus on the practices of detention, deportation, and abandonment. Focusing on South Africa, a paradoxical case where a progressive constitution coexists with systemic xenophobia, I aim to understand the ways in which xenophobic impulses of border security and migration management are used to enact violence on so-called undesirable migrants. I do this by developing the concept of border infrastructures—the interconnected practices that facilitate detention, deportation, and organised state-abandonment at the level of the street and city. The paper situates South Africa's border regime within global racial capitalism, linking its exclusionary tactics to US and European anti-migrant populism. In so doing, I argue that border infrastructures—material (detention centers, policing) and immaterial (legal limbo, xenophobic rhetoric)—operate as tools of racialized social control. These infrastructures at once maintain South Africa's demand for cheap racialized labour while also placating nationalist demands based on exclusion. Ultimately, this paper underscores the structural contradictions of migration governance where state criminalize migrants while depending on their labour—a now global phenomena of migration governance.

Presenter(s): Ali Bhagat

Conservation politics and racial politics in the Louisiana fisheries

In the past decades, federal and state-level legislatures in the United States have introduced restrictions on commercial shark fishing to combat the practice of shark finning and illicit trade in shark fins.

While welcomed by conservation organizations and animal rights activists, for commercial fishermen in coastal Louisiana, who rely on the trade in sharks and who operate in an industry pressured by a globalized seafood trade, these restrictions, however, have contributed to a deepening of existing processes of dispossession and expropriation—and have fomented racial antagonisms within the fisheries.

This paper explores how conservation politics and the moving grounds of fishery legislation on commercial shark fishing becomes a terrain for the unfolding of racial politics in coastal Louisiana. In doing so, the paper traces the changing contours of racialized social relations among seafood traders and commercial fishermen to analyze how fishermen make sense of the conditions of possibility under which they work—and how they articulate their grievances along racial registers.

Finally, by drawing comparison to how articulations of race and capital in this context historically have materialized in a coalescence of conservation politics and "race talk", the paper considers how ideas of nature and ideas of race can "work together" (Moore et al. 2003) to legitimize political projects of exclusion.

Articulating race and capital: producing cheapened labour in the colonial plantation and contemporary borders

In 1916, on a tea plantation in northeast India, 'tribal' Oraon workers made trouble. They attacked managers, damaged property, called on a 'devil' named Logo to destroy the British, and beseeched Kaiser Wilhelm to help them. Their aim, stated afterwards at a tribunal, was to establish an Oraon Raj. The Oraon had been displaced from their land by capital encroachment. Ethnographers had cast them as 'tribal' and thus displace-able. Many were then pressed into plantation labour where they were called 'jungli', people of the jungle, cheap and with strong super exploitable bodies.

Categorised as 'tribal' and then 'jungli', Oraons were first displaced and then immobilised. Oraon worlds were reduced: they became coolie labourers whose labour propped up a system that marginalised them. The uprisings in plantations can be read as attempts to widen narrowed worlds. When capital and race articulate, subjects are created; subjects who are culturally denigrated, disembedded from social worlds and immobilised to produce cheapened labour. I will study the relations and ideologies that articulated race and capital to reproduce such cheapened subjects in colonial times before studying how race and capital are articulated in the contemporary conjuncture to produce cheapened and super exploitable 'migrant labourers'. What might this tell us about the durability of colonial capitalism?

Presentation(s): Dreaming about deceased parents: the role of dreams in childhood grief in northern Namibia

The death of a parent is considered to be one of the most stressful events in the lives of children. In sub-Saharan Africa, many children experience the death of a parent before the age of 18, as adult mortality in this region is one of the highest in the world. Namibia is a typical example of this. In this country, the HIV epidemic has contributed to a high number of orphans.

The documented experiences of grief among African children is limited. More generally there is a dearth of ethnographic and in-depth accounts of the grieving experience of children. However, understanding the way African children experience loss and grief is important. It contributes to our theoretical understanding of childhood bereavement, and offers insight for bereavement care. Attention for children's own perspectives is in line with the anthropology of childhood which seeks to document children's perspectives on, and participation in the social world.

The question as to how cultural models shape grief as a response to death is hereby essential. One of the themes addressed in ethnographic studies on grief, are connections between the living and the dead. The thinking that spirits of the dead stay in meaningful contact with the living takes place in many cultural settings. Dreams about the deceased are sometimes interpreted as contact with the dead. Demmer (2007) similarly observed that in South Africa symbolic ties with the deceased were sustained through dreams.

This study describes how dreams of deceased parents are part of the way Ovambo children in northern Namibia experience and deal with the death of their parents. In this ethnographic study, eleven orphaned children, their caregivers and other informants took part.

Dreams about their deceased parents were often part of the children's responses to bereavement. Children dreamt about interactions with the deceased parent, about the deceased being present in their room, or about images of the parent's dead body. On the whole, such dreams were perceived as unpleasant and frightening. An important explanation for such dreams was that children were not able to forget their parent as dreams would actually be 'thoughts' about the parents. In other cases, they were perceived as real dreams or they would be related to witchcraft. A common remedy against children's dreams was to drink sand from the grave of the deceased parent. Other remedies included taking the child to the hospital, or to the traditional healer, and praying. Possibly, this practices aim to discontinue the connection with the dead.

Dreams about the deceased parents somewhat seem to interfere with Ovambo notions of dealing with childhood grief, such as the restricted duration of expressing grief and the emphasis on forgetting. For children, dreams might appear to be a way to express their sadness after the

permitted duration, and several of them were comforted by their caregiver after talking about their dreams.

Presenter(s): Mienke van der Brug

Holding Back, Reaching Out: Defensive Individualism and Connection Seeking in Ghost Ridden Communities

In post-industrial Milwaukee, where racialized disinvestment, deindustrialization, and segregation have long shaped the urban landscape, the ghosts of institutional failure linger in the everyday decisions of struggling parents. Drawing on five years of longitudinal, mixed-method, person-centered study of parenting program engagement in some of the city's most disadvantaged zip codes, areas with disproportionately high Child Protective Services (CPS) report rates, this paper examines how Loewe's (2018) and Smiths' (2007) model of defensive individualism operates as both a protective strategy and an engagement deterrent.

Within zipcodes marked by entrenched poverty and the hollowing of public services, and the policing of Black family life, parents take on defensive individualism, a protective posture that prioritizes dignity, autonomy, and the refusal of judgment. This posture, while adaptive, can also hinder participation in parenting programs, which are often perceived as punitive or patronizing. Yet even as they guard against harm, many parents express a deep longing for community, connection, and support that is trustworthy, nonjudgmental, and affirming. What emerges is not simply rejection, but a complex negotiation: a selective openness shaped by the memory of past institutional betrayals and the desire for care that does not compromise self-worth.

This paper explores how immaterial forces like stigma, distrust, surveillance, the fear of being judged, or misunderstood, and the memory of past negative institutional entanglements become material in the parenting landscape, echoing the afterlives of punitive welfare policies, carceral entanglements that continue to haunt Milwaukee's urban poor.

Using qualitative methods, we describe how the ghosts of institutional harms are ever-present even in how disenfranchised parents search for support. This work calls on anthropology to reckon with these ghostly influences, to interrogate the structures that create them, and to rethink how we engage with communities in ways that respect survival strategies without reinforcing the conditions that necessitate them.

Therapeutic Hauntings: Conspiracy Theory as Shamanic Narrative

A case of infant mortality in a public hospital in Newark, NJ led to forms of emotional distress for the father. Curiously, the cause of death was unclear to him, but did not require further elaboration or explanation. Allied with a conspiracy theorist on the street, this young father resolved his experience through a narrative of malevolent power, regaining his power of signification and sense

of control, while reinforcing an explanation of marginalization and dispossession common among young Black men in this neighborhood: the powers that be are behind the curtain, whose visible face is the exploitation of Black folk.

The experience of public health, and the narrativization of experience on the street both stem from a position of marginality. I argue that conspiracy narrativizing serves a shamanic function, providing agency, therapeutic control, and a sense of control to those haunted by the history of race in the U.S. and disoriented by the gyrations of political-economic volatility in racialized capitalism.

Tracing Traumas through Jokes: Affective Economy of Indian Tragicomedy

How do we grapple with traumas after the event? How through the narrative storytelling form of comedy, do we find a sense of *communitas* (Victor and Edith Turner) among strangers coming together in tiny comedy clubs in the gullies (bylanes) of Delhi, India? The Indian stand-up scene has bloomed in the last decade with comedians from caste, religion and gender minorities taking up the space to talk about their histories and present. It is no longer merely laughing at them through stereotypical jokes by elite upper caste comedians but laughing with them as a form of solidarity and empathetic thinking (Bennett 2005). The feelings come to the surface of our bodies through their incongruity in the form of comedy and its qualified emotional responses of shared laughter, claps, hoots and sometimes even silence, vandalism, violence and verbal abuse. Comedy in India has become a serious business with comedians imprisoned, abused, harassed, and comedy spaces vandalised for jokes that express how they feel about living with authoritarian neoliberalism. Majoritarian Hindutva mobs are not only lynching minorities in small towns and villages (Hansen, Chatterji and Jaffrelot 2019) but also becoming visible and volatile in urban "pop" culture spaces. With the rise in caste, religion and gender based violence against comedians and citizens (along with increasing inequality, unemployment), there is also a rise in joking about this form of living by those vulnerable. Another feature of Indian authoritarianism involves the regulation and censorship of not just jokes but also news media, with prominent journalists quitting national news channels due to increased control of what news should be broadcast. Political comedy spaces, both online and offline, have become forms of critical journalism and thereby creative resistance against the assault on democracy in these times.

So, how do the minoritarian feelings that reverberate from generational and systemic Othering permeate the bodies of the citizen-publics of the majoritarian Indian state through the entangled event-space of comedy? How do the boundaries of our caste-religion-gender stamped bodies collide within and through shared storytelling as a form of counter-public making? How does the intersubjective potential of political communication occur through the comic narrations of trauma, grief, anxiety and fear of the comedian and through the empathetic listening of those who come to watch the comedy shows? and how in doing so, the 'minor feelings' of Dalit and Muslim bodies 'demand recognition of and distance flinch' (Hong 2020) from their everyday experiences of discrimination, marginalisation, assault to their body and sovereignty? This paper traces the comic affect through ethnography of Indian comedy clubs in New Delhi, India, and by interviewing 6

comedians and their audiences about the front and back stage experiences of performing stand-up comedy as a form of vitality enduring the despair of everydayness

Presenter(s): MAGNA MOHAPATRA

Who Are We Writing For? Haunting the Narratives of Personhood through Obituary Analysis

How do our memories of the dead perform ongoing moral work?

Death has long been a focus of anthropological theorizing. Preparatory rituals like those described in Desjarlais' *Sensory Biographies* (2003) are meant to help the dying individual enter the afterlife unburdened. Commemorative practices like those described by Bloch (1971) and Rosaldo (1984) serve the needs of the living, allowing them to process and move beyond the loss they have experienced by providing pathways to social (re)integration of the mourning self into normal modes of being.

This flash presentation explores the practice of obituary writing as a death ritual and challenges these normative understandings of preparatory and memorial practices as central to the work of grief. Instead, this presentation asks: what sort of work does obituary writing perform on behalf of the dead themselves, who are neither as settled as dead nor as separate from the living as normative scientific and biomedical notions of death would suggest?

Drawing on theories of moral personhood and the construction of the self from theorists such as Michael Lambek (2013) and Tanya Luhrmann (2020), this presentation examines obituaries from Pittsburgh, PA from the late 20th century and the 2010s. Changing patterns of commemoration, as demonstrated through the language and rhetoric of these public affirmations of morality across time, illustrate the entanglements of the needs of the living and the recuperation of the deceased, placing the project of self-making not only in life but also in the time after death. Through an exploration of the practice of obituaries, this paper asks: how does the creation of certain forms of memory about the dead place moral weight on and enact moral transformations of the deceased?

"That Thing". Emotions, anger and post-colonial shadows in an Italian-Bangladeshi family in Italy

The article is a reflection on a research activity carried out, in parallel with a socio-educational assistance work, within the domestic walls of an Italian-Bangladeshi family in Italy. The research aimed to go beyond the individualizing contribution of neuropsychiatric diagnostics, trying to highlight the cultural, social and political origins of the restlessness of the eldest son of the family - to whom the social services have diagnosed various behavioral disorders - in relation to the conflict inherent in the transnational habitus, which is the result of the encounter/clash between the Bangladeshi habitus and the Western habitus (Zeitlyn 2010), both present within the family unit and generating, in their conflict, a crisis in the horizon of meaning of each of the parties involved (De Martino 2019).

This intervention aims to highlight the post-colonial, political nature of this conflict, expressed by the young boy in evanescent terms, which make it a truly phantasmal presence (Gordon 2022). The anger and shame experienced by the young boy are also fueled by a deep disagreement with some typical traits of his parents' habitus, which are expressed in an emotional absence of the father, and in a strong, often physical, maternal normativity, which he defines as "that thing", testifying to his unspeakable, shadowy and phantasmal nature, as well as to the ways in which his parents interact with the Western habitus, always straddling the line between repulsion and the desire for lactation (Fanon 1952) and the gender rules that lie behind it. This complexity, which takes the form of emotional turmoil occupying the young man's mind, is justified by the same young man as the result of the endemic violence to which Bangladesh, its history and its present are accustomed. Based on his reflections, our intervention aims to reconstruct the phantasmal nature of the links between intergenerational conflict and the post-colonial nature of the suffering that stirs up the clash between generations.

3883 The Spirit of Care: Notions of Health, Healing, and the Afterlives of Care

Start Date: 11/21/2025 12:45 PM **through** 11/21/2025 2:15 PM

Venue: Marriott **Room:** MGB - Salon B

Type: Oral Presentation Session

In healthcare, care is often categorized as a technical or practical action, with caregiving primarily falling under the responsibility of family and friends. Most physicians rarely engage in caregiving, leaving emotional and practical tasks to nurses, social workers, and personal support networks. As a result, caregiving is frequently associated with lower-status professions and stigmatization. Within the medical field, care and caregiving become divided between professional duty and personal obligation. However, care extends beyond the immediate moment of illness; it lingers in memory, shaping how societies and individuals reconstruct experiences surrounding the world of health. While scholars have distinguished between emotional support and physical actions, care encompasses more than just gestures or words offered at the moment.

This panel examines care as both a socially and historically embedded practice, questioning and redefining its boundaries. It explores how disease, death, mental health, and healing are

remembered, narrated, and embodied in everyday life. Drawing on theories of memory, medical anthropology, and care, this panel investigates how individuals and institutions reshape their understandings of care throughout the entire journey of illness. How do individuals reconcile with their bodies and identities after injury or sickness? How does care shape the experience of mental health, illness, disease, and death? By tracing the intersections of caregiving, institutional responsibility, and personal adaptation, this panel reveals how care functions not only as an individual moral act but also as a broader social and political process. Ultimately, our presentations explore how the afterlife of care and acts of caregiving are remembered, performed, and reimagined across time and space.

Presentation(s): Echoes of a Pandemic: Memory, Care, and Crisis in Vietnam

The Covid-19 pandemic has profoundly shaped daily life, particularly in Go Vap District, Ho Chi Minh City, where it not only disrupted routines but also overwhelmed the healthcare system. This presentation explores the challenges of researching and conducting ethnographic work on a global pandemic after the fact. What does it mean to care during and after a pandemic? How do people reconstruct and reiterate their memories of care? Drawing on interviews with frontline and healthcare workers in southern Vietnam, I argue that care is deeply intertwined with collective memory, as past crises, shifting political economies, and evolving medical knowledge shape contemporary understandings of health and well-being. Through these informants' recollections of their experiences during the pandemic, they reveal how they define care and how those definitions continue to resonate today. Engaging with theorists such as Maurice Halbwachs and Paul Connerton, I examine how individual memories are shaped by historical events and broader social and political contexts.

Muted Regret: Caring for the Afterlife in an Indonesian Family

How do family members cope with the loss of loved ones who pass away far away from home, especially when dying at home and surrounded by family is considered to be an element of a 'good death' and a necessity for a 'good afterlife'? This question becomes increasingly pressing in the context of Indonesian's Universal Health Care system, which facilitates access to advanced cancer treatments far away from home – also for those at the end of life. In this paper, I draw on the case of Rika, a 32 year old woman who travelled across the Indonesian archipelago to get cancer treatment in the Indonesian capital of Jakarta, but passed away in a Jakartan hospital after five months, after

which her father had to return her body home. Inspired by Douglas Hollan's (2020) work on ecological haunting, I show how the family members allow themselves to be haunted by the spirit of the deceased. This haunting helps them to endure the (muted) regret surrounding the tragic death of their daughter. I explore the multifaceted meaning and ethical significance of continuously uttering to have 'no regret' when dealing with a tragic loss. Uttering 'no regret' serves not only as a performative act that fulfills social and cultural expectations of politeness and confirms that they chose the 'best possible' biomedical options, but also helps to narratively index a 'good afterlife' for the deceased.

Presenter(s): Hanum Atikasari

Psychopharmaceutical entanglements

Maldives has been undergoing rapid social transformations since the country's democratization in 2008. A decade later yielded the Maldives' psy turn when, starting at the end of 2018, the incoming President prioritized mental health care as the focus of his modernization project. This talk explores how "the biotechnical embrace" (Delvecchio Good 2007) of psychopharmaceuticals is lived in the Greater Male' Region of the Maldives. Drawing on person-centered narratives, I limn how the institutionalization of psychopharmaceuticals in the contemporary moment reconfigures what counts as illness and care in the present as well as in the proximate and distant past. Attending these entangled temporalities in individuals' narratives illuminates how psychopharmaceutical technologies provide "ethical affordances" (Keane 2015) through which interlocutors posit themselves and others as moral persons.

Presenter(s): Anu Ahmed

Forming Caring Bonds: Volunteer/Client Relationships in a Canadian Hospice

For the weeks, months, or years in which people have received a terminal prognosis but have not yet reached acute stages of death, thousands of people in Ontario, Canada continue to navigate living in a new context: while they are dying. Through 24 months of ethnographic research at hospice palliative care organizations, I found that clients of hospice often lived vibrant and social lives while dying, contrary to the biomedical idea that dying, like death, represents a discrete physiological event. My research shifts from a focus on hospital and biomedical-based practices of dying to the home: intimate places in which clients open their doors to hospice volunteers who fill a unique social and spiritual role in the crucial moments of living while dying. Through volunteer services at hospices, clients and volunteers form meaningful and intimate relationships with each other, seeking to understand what it means to continue living while dying, thinking through the spiritual and religious implications of dying, and even what it means to have a 'good

death'. Volunteers and clients meet with the mutual understanding that the client will die – rather than hinder their connection, this face opens a unique opportunity for human connection based on values of respect, dignity, and grace during the dying and living process.

Discussion

1882 Between Relativism and Reproach: Exploring Value Judgments about Good Human Lives within Theologically Engaged Anthropology

Start Date: 11/21/2025 12:45 PM **through** 11/21/2025 2:15 PM

Venue: Marriott **Room:** MGB - Salon C

Type: Roundtable/Town Hall

This roundtable advances the pioneering work of Theologically Engaged Anthropology and will address a critical question: how can anthropologists responsibly navigate the extremes of relativism and unreflexive judgmentalism to support good human lives?

Anthropology has historically embraced relativism, but some critiques argue that it fosters "moral recusal" (Cook 1999). A shift toward universalized narratives of human suffering has led to a 'judgmental turn' (Robbins 2023), where anthropologists apply ethical and political commitments in ways that often lack explicit criteria. This shift can lead to moral condemnation of cultural practices without sufficient engagement with their internal logic. Conversely, critiques of relativism have sought to rehabilitate aspects of cultural interpretation without abandoning moral reasoning altogether (Geertz 1984). This panel builds on theologically engaged anthropology's transformative framework by encouraging anthropologists and theologians to work together to produce robust frameworks for defining and assessing good human lives across cultures.

The roundtable will examine how theology and anthropology intersect in evaluating moral and cultural norms. Through comparative analysis of theological and anthropological approaches, we explore how different traditions define good human lives and where common ground or conflicts arise.

A key consideration is how theological frameworks offer structured ethical criteria, while anthropology provides empirical insights into how those values manifest in practice. This dynamic is crucial in assessing both heterodox and orthodox religious formations (Coakley 2018). Theologically Engaged Anthropology has largely focused on epistemology and description; this roundtable shifts the focus to normative discussions, addressing the challenges of defining and promoting good human lives amid global moral pluralism.

Goals

This roundtable gathers senior and emerging anthropologists to:

1. Develop criteria for defining good human lives across diverse cultures.
2. Equip anthropologists to navigate between relativism and moral judgment with greater reflexivity.

3. Encourage anthropologists to dialogue with theologians to refine ethical and cultural analysis.

By fostering interdisciplinary collaboration, this discussion will help anthropologists refine their ethical stances while maintaining rigorous cultural analysis, ultimately contributing to a more nuanced and responsible anthropology.

7554 Exposures and Their Bodies: Part One, Institutional Violence, Planetary Damage, and Embodied Resistance

Start Date: 11/21/2025 12:45 PM **through** 11/21/2025 2:15 PM

Venue: Marriott **Room:** MGB Salon D

Type: Oral Presentation Session

Studies of exposure have brought attention to the fragile and entangled relations of bodies and environments. From toxic chemicals to changing climates, exposure challenges notions of bodies and selves as separable from the worlds in which they work, play, eat, and breathe. This panel builds on conversations on exposure from feminist studies of science and technology and environmental anthropology. These studies have drawn attention to how experiences of exposure are not simple facts but are rather caught up in epistemic struggles that materialize the impacts of exposure on some bodies and not others. They demonstrate ways exposure makes, even as it degrades, bodies and selves, inscribing local and global hierarchies of race, gender, and class in corporeal forms and capacities.

In the first part, we consider how environmental exposures leave indelible marks on bodies, serving as ghostly reminders of past injustices that continue to haunt present lives. We focus on bodies as sites of harm, labor, and contested thresholds. Papers in this session trace how bodily experiences of exposure are politicized, measured, denied, or transformed through scientific infrastructures, legal recognition, and embodied testimony. Presenters examine these issues across a range of contexts. In Japan, the discharge of nuclear wastewater renders uneven damage as epistemic uncertainties shape the violence of radioactive exposure on bodies and oceans. In the anthracite mines of Germany, deafening sound is translated into scientific diagrams that simultaneously render exposure knowable and enable its debilitating effects on workers' worlds. Indian construction workers frame exposures as capacitating bodies and selves, even as such capacitations lock them into ecologically damaging forms of work. In the Sundarbans-Bangladesh, indigenous men and women register rising salinity levels as bodily exposures to everything from brackish water encountered in aquaculture to the heat and toil of brick kiln labor as a viable source of livelihood on desiccated land. In the Republic of Nauru, the aftermath of extractive industries

haunt contemporary migration regimes, entangling offshore containment policies with toxic exposures.

Across these settings, the papers chart how exposures are rendered through talk, diagrams, reports and models, in ways that shape the uneven transformations of bodies and worlds. Attending to issues of bodily breakdown, adaptation, and resistance, we ask:

- How do institutional, scientific, or bureaucratic mechanisms define and delimit bodily capacities for exposure?
- In what ways do embodied experiences exceed official logics of harm and risk?
- How does exposure shape futures of health, labor, mobility, or survival?
- How do exposures leave traces that haunt present bodies-through chronic illness, inherited vulnerability, or contested memory?

Presentation(s): Toxic Entanglements: Asylum and Extractivisms in the Republic of Nauru

Recent years have seen a dramatic increase in the outsourcing of asylum processing and resettlement from Global North to South. Many of these containment practices retrace the fault lines of colonial extractive regimes riddled with toxic harms. This article draws on long-term ethnographic research conducted in the Republic of Nauru located in the equatorial Pacific. I consider how Nauru's past phosphate industry gives shape to the emergence of contemporary toxicities related to Australia's outsourced asylum regime. In focusing on the relational production of extractive sectors, I advance the notion of 'toxic entanglement' to help account for the neocolonial, racist and gendered nature of bordering processes. I think against the grain of dominant humanitarian portrayals, drawing attention to asylum as a toxic extractive industry. In the pursuit of profit, racialized migrants are exposed to detention, demeaning legal procedures, everyday abuse and objectification that wreaks havoc on their bodies. I contend that the policy of outsourcing asylum also routinely concentrates toxic harms in Black and Brown communities. There is a relationship between the land and Black life that is disproportionately targeted for toxic mineral and migrant industries, and subject to risks of poisoning, police violence, dispossession, and poverty. Locating the solidarities that develop between migrant and Indigenous communities, I ask what forms of resistance emerge in spaces of toxic entanglement?

Presenter(s): Julia Morris

Breathing Dust: Making and Breaking Worker Bodies in the Indian Construction Industry

When I introduced my research on the Indian construction industry to middle-class acquaintances, I received similar responses. They would begin by criticizing the inhuman working conditions in the industry, expressing compassion for construction workers before affirming that they could never do such work. Such narratives drew attention to the dangerous exposures of construction work, from the hot sun to the crushing weight of bricks or suffocating dust. While these sentiments came from genuine concern, my focus here is on how such statements pointed toward a tension between the production and differentiation of construction worker bodies; ones that could work among debilitating exposures. Worker narratives seemed to support this image, for example, stone masons spoke of and oriented to the exposures of their trade, especially stone dust kicked up by saws during cutting. Repeated exposure and acts of repair capacitated worker bodies, generating trade-specific habits (adat) from the ability to breathe dusty air or handle stone slabs. Such capacitations grounded locally valued worker bodies and selves, yet they also marked construction worker bodies as separate from middle-class ones and consigned them to debilitating forms of work. Such tensions lie at the heart of the ambiguous capacitations brought on by exposure. Taking seriously the ways construction worker bodies are made by exposures even as they are bound to the ecological degradations of capital-intensive urbanization.

Presenter(s): Adam Sargent

Spectral Data, Fragile Bodies: Haunted Temporalities of Nuclear-Disaster Wastewater

The ongoing release of "treated" radioactive wastewater from Fukushima Daiichi into the Pacific Ocean comprises a form of open-ended exposure where both presence and absence haunt monitoring regimes and affected bodies. This paper examines how the ocean-discharge plan by Japan's TEPCO was shaped by "spectral data"—information simultaneously present yet incomplete, cited yet inaccessible, authoritative yet contested. Drawing on expert-panel assessments, this paper revisits an influential IAEA 2023 compliance report—which effectively green-lighted TEPCO's ocean-dumping plan. Independent scientific evaluations reveal a disconnect with TEPCO's assertions of safety, highlighting vast data inadequacies. Given measurements were taken for select isotopes while sampling only a fraction of storage tanks, the resulting gaps in knowledge render critical radionuclides as ghostly presences in regulatory discourse.

This paper regards such lapses in data practices not as passive gaps but rather as active forces, producing lacunae that function as strategic unknowns. Such selective monitoring predicated on data-glitching yields exposures that can be simultaneously affirmed and denied, producing new bodily vulnerabilities that haunt human and more-than-human worlds. Spectral data practices thereby reinforce colonial patterns of exposure where certain bodies become sites of environmental damage at once endemic and transboundary, inscribed through physical exposures and epistemic violence.

Presenter(s): Nan Kim

Fiery Bodies, Salty Souls: corporeal experiences of Munda indigenous community from Kalinchi, Sundarban-Bangladesh

Climate change-induced disasters like cyclones, storm surges, and sea level rise are leading to salinity intrusion in Kalinchi, a village in the peripheries of Sundarban-Bangladesh. Salinization in the soil and water adversely impact livelihoods such as agriculture and migration patterns of indigenous groups like the Munda, where men become transient brick kiln workers. This radical form of adaptation renders their bodies vulnerable, as they are exposed to noxious fumes and extreme heat spewed from brick kilns. As one kiln worker said, "While we make bricks for the rich, our poor bodies burn like inferno". Others suffer from asthma, impaired vision and malnourishment.

Salinity intrusion transforms exposures for Munda women as well. Burdened with familial responsibilities and income generation while their husbands are away, many turn to seasonal labor in brackish aquaculture farms. This direct exposure to salt results in multiple illnesses related to salt exposures, such as skin lesions, hair loss and gynecological complications. As one worker noted, "because we breathe salty air and drink salt water – it penetrates our body and eventually reaches our souls". Here, salt emerges as a powerful element with the capacity to permeate the boundaries between the inside and outside, the body and the soul. I argue that such exposures illuminate how processes of climate change and damage result in embodied expressions and corrode the very existence of Munda community.

Presenter(s): Remeen Firoz

Knowing Noise Underground: The role of proxies and the work of analogy in making mining noise an environmental thing

The miner's ear, as Rosalind Morris (2008) notes, must be attuned to sounds of danger in (his) working environment, yet through this very exposure, his faculty of hearing becomes progressively diminished, exposing him to even greater risk of injury. This paper takes up the problem of the (gendered) miner's ear as it emerged in Germany's anthracite mines following the codification of 'hardness of hearing' as a legally recognized type of occupational illness in the 1960s. I explore how scientists and engineers deployed experimental models to test the effects of the noise reverberating across the subterranean space on miners' bodies. These models transduced noise into de-sonified diagrams, which enabled noise exposure to be quantified and threshold values of acceptable exposure to be drawn. In other words, these knowledge infrastructures were key to making noise known as an "environmental thing" that produced deadening effects on the sensitivities of the inner ear. I use this history to foreground the role of proxies and media devices that "stand-in" for the human and how the cultural work of analogy involved in this reduction shapes the regulatory imaginations and technologies of protection that allow noise exposure to persist. I conclude by considering the world-making and world-breaking aspects of exposure by attending to how it alters miners' acoustemologies towards ones that involve sensing through bone conduction, cochlea implants, and/or the ear's own acoustic emissions.

7375 In Memory of Development: Orienting Ethnographies of Climate Adaptation and Energy Transition Infrastructure in Anthropology (Part 2 of 2)

Start Date: 11/21/2025 12:45 PM **through** 11/21/2025 2:15 PM

Venue: Marriott **Room:** MGB Salon E

Type: Oral Presentation Session

Climate change is indisputably a pressing and urgent crisis requiring both political and material planning to achieve meaningful mitigation. Large scale engineering and infrastructural projects have emerged as a predominant strategy by which national and regional economies anticipate the looming dangers of climate change. Proponents of such major construction endeavors argue that they will bring benefits far beyond their technical functions of supplying renewable energy, storing captured carbon or holding back ocean water. Inclusive prosperity, economic justice, and societal beneficence are just a few of the key moral discourses for justifying massive public expenditures in new technological and environmental infrastructure across the globe.

In light of the urgency of climate change adaptation strategies, a growing body of anthropological scholarship has rightly set about examining the societal and ecological impacts of these immense investments in climate mitigation (Boyer 2019; Cross and Neumark 2021; Vaughn 2017). This panel responds to emerging patterns across this literature finding injustice, expropriation and exploitation in green transition projects (Argenti and Knight 2015; Schwartz 2024). Consequently, we open a dialogue about the barbed complexities of responding to climate change at an adequate scale without these urgencies eclipsing either a necessary skepticism of industrial interests or the multidimensional costs of adaptive intervention.

Disquietingly, visions of a just green transition resemble the promises of society-wide improvement in conditions of human life promised by the development agendas of the latter half of 20th century (Li 2007; Duncan 2004; Scott 1998). Beyond promises, the political economy of green technology iterates on colonial patterns wherein technologies developed for the global north are transposed to former colonies, extracting profit from global south national funds and natural resources. Nevertheless, the 21st century's climate adaptation and energy transition infrastructure projects, as they evoke re-emergent dreams of technologically facilitated affluence, rarely confront or incorporate social knowledge of development's prior failures: environmental destruction, expulsion of indigenous people, forcible embedding in capitalist exploitation, elite empowerment, and dependency economics.

To begin unpacking the scholarly dilemmas of green transition agendas, this panel seeks to explore how the planning imperatives and expansive, pro-social promises of climate change mitigation are balanced against social and theoretical knowledge of expected limits. We will consider how

anthropological scholarship and ethnographic commitment can engage constructively with the challenges of adapting to climate change without erasing or obscuring its discontents.

Presentation(s): Energizing Inclusion in Solar Infrastructures: Artisanal Palm Oil and Electricity Struggles in Rural Nigeria

Off-grid solar power as an "adverse infrastructure of inclusion" (Cross and Neumark 2021: 1) has yet to significantly expand electricity access in East Africa. Similar patterns unfolded in Nigeria as agrarian communities interacted with mini-grid energy markets since the early 2000s. In 2019, the World Bank and African Development Bank launched the Nigeria Electrification Project to increase electricity access in rural areas with solar infrastructure, and designated Nigeria's Rural Electrification Agency (REA) as an implementing institution. My paper examines a recent energy transition and agricultural development initiative of REA. The project introduced solar-powered machinery and a minigrid extension to a community of oil palm millers in southern Nigeria whose small businesses sustain community food access. Even though the artisanal food producers already lived near a solar mini-grid before the project, they used diesel-powered machinery to process palm fruit from their wild plantations. Drawing from ethnographic research conducted between 2022 and 2023, I examine how my interlocutors navigated a racialized international development complex (Pierre 2020) as Black peoples of varied positionalities in Nigeria's food system. I am particularly attentive to elite Nigerians' strategies for 'energizing inclusion,' community responses to their technocratic solutions, and the structural conditions that ultimately constrained the impact of project activities.

Presenter(s): Aderayo Sanusi

Re-building City and Society: Towards New (and Old) Visions of Water in India's Thirsty Capital City

Beyond the development dreams of the 20th century, climate change adaptation can also turn to the past (by way of traditional knowledge systems and traditional ecological practices) to construct visions and inspire action for a more sustainable future. With respect to a growing urban water crisis in urban India, this paper will draw upon extensive fieldwork in Delhi to show how various actors in India's thirsty capital city seek to achieve environmental-urban resilience and inspire climate-related citizen action and participation by reinvigorating social traditions previously denigrated and left by the wayside during 20th c. modernization. By using decentralized traditional water management practices (albeit in a slightly changed manner), state and civil society actors seek to catalyze people's participation in water infrastructure development and maintenance

towards creating a more climate-friendly and socially-just city. Counterpointing Nehru's (in)famous comparison to dams as the "temples of modern India", such work often takes up small-scale infrastructure interventions at the neighborhood-level rather than large-scale infrastructure projects at an inter-state level. In this respect, such work seeks to revive waterbodies as well as community practice around them, with foundations in longstanding eco-cultural traditions rather than in any perceived or projected break from them.

Presenter(s): Lav Kanoi

Completing Technology with Stories: Attaching Socioeconomic Value to Australian Carbon Management

Under the shadow of economic interdependence between commodity export industries and the state, Australia's contribution to climate and energy futures is partially articulated through technology development. Through intensive investments between 2005 and 2015, Australia has supported institutions conveying arguments that carbon capture and storage (CCS) technology can manage the carbon dioxide of carbon-based fuel sources. Invoked as an industrial technology and thereby entangled with high-modernist visions of landscape transformation, conceptual visions of CCS as energy transition and climate mitigation infrastructure recur over time in government, media, and scientific representations, but with different forms. Drawing on ethnographic research with CCS practitioners and analysis of academic and journalist presentations from 2000 and 2017 regarding the ways in which CCS technology has been imagined to "attach" to pre-existing or yet-to-emerge energy and climate infrastructures, I contribute to tracing how imagined relationships between past, present, and future infrastructures are socially stabilized, and at times, selectively forgotten (Koch 2019). A cross-temporal perspective on the different socioeconomic values set into relationship with Australian CCS technology contributes to accounting for its ghostly persistence.

Presenter(s): Mallory James

Recurring Greek Energy Crises and the Un-Natural Ghost of Gas Futures

This paper expands on 2018-2019 research in Athens and Thessaloniki on energy austerity and resistance during the euro debt crisis—a haunted time when financial austerity enabled "performative" leverage (Shor and Raudon 2018) for reform of Greece's public energy system. Obscure, market-centric rules nudged aside issues of affordability, favoring visions of an efficient green future, albeit based on foreign capital—reinforcing Greece's legacy as "a porous state" (Smith-Nonini 2020). In 2022, Russian gas cuts spawned an EU-wide crisis, shifting rhetorics of sustainability to energy security. Yet, in 2023 prices stabilized. Greece's investor-owned solar build-out met a remarkable 57% of electric demand. But from mid-2024 Greece fell back into crisis, with doubling electric rates, prompting official appeals to Brussels.

This paper unravels this emergency, resurrecting ghosts of Cold War development pasts and the specter of "engineered vulnerability" (Vaughn 2022). It involves Balkan electricity exports to Ukraine, creating new energy demand in Greece; a bevy of gas plant owners who figured out how to profit from both gas and solar while passing costs to ratepayers; and American lobbyists selling

dreams of a regional Greek gas hub for pricey US LNG. Ironically, despite digesting huge EU subsidies, the hub faces low demand due to cheaper "origin swap" gas ostensibly from a Turkey/Azerbaijan pipeline, but originating in Russia.

2926 Writing Into Ordinary Ghosts: Papers Honoring the Work of Kathleen Stewart

Start Date: 11/21/2025 12:45 PM **through** 11/21/2025 2:15 PM

Venue: Marriott **Room:** Studio 10

Type: Oral Presentation Session

Ordinary life is animated by what we might call ghosts: unresolved and half-realized memories, troubled atmospheres, afterlives of histories still seeking justice. Such ghostly impacts reveal how people imagine, embody, feel and refuse intergenerational power structures, in ways that may be lateral or emergent to explicit political engagement. Rather than fix ghostly activity in the realm of supernatural experience, this panel blurs the uncanny and the mundane by exploring the work of Kathleen Stewart. Stewart's profound influence has created possibilities for writing an anthropology of the ordinary including spirits, forces, charges, half-remembered fantasies, atmospheres, intensities, and gusts of old stories that let us enter the often inchoate affective registers of everyday life and its social meanings. Our papers trace the ordinary hauntings of methane, frackquakes, darkness and wind in the Permian Basin in affects sensed as ghosts; explore 'the creep', or the spooky way that houses tend to shift on their foundations in the former secret atomic city of Oak Ridge; trace elemental forms and processes, from clouds to helium and the collembola that carries the bacteria responsible for the scent of geosmin; track two modes of "ghosting," both in its radical absencing and its radical presencing -- to explore the social worlds of contemporary conspiracy theory in the US; and follow the reverberations created when even ordinary species go extinct, in this case a dusky little sparrow, who spent its last days at the Walt Disney World Resort in

Florida. Drawing inspiration from 35 years of Stewart's experimental poetics and theoretical innovations in anthropology's understanding of worlding, affect and narrative, this panel explores various ways to write with the ghosts that live in the ordinary.

Presentation(s): Unfortunately, when you live out here, all you see is the details

This paper examines emergent sensory registers in an energy sacrifice zone in the American West. It considers the terms and technologies of perceptibility for geophysical and atmospheric processes as repetitions and refrains of experience. Through an ethnographic conceit of returning to the same site every day for one month, a sensory-technical assemblage forms around the ordinariness of wind as infrasonic illness or shadow-flicker produced by turbines, air pollution and gas emissions monitoring, dust storms, butterfly migration or listening with fracking and water dowsing. The fiction of sameness exposes how atmospheric diffusions and their barely-felt sensations de- and re-form subjects through durational complexity. Experimental writing works against tendencies to arrange situations into analytical coherence, instead attuning to an elemental poetics and politics of imperceptibility

Presenter(s): Megan Gette

Ghosting as Presence and Absence

Exploring conversations and hangouts with two modern American conspiracists, this paper thinks about ghosting, conspiracy, and security at scales that I learned about from talking with Katie Stewart over the years in houses and offices and cars. Jerry is a QAnon Redditor whose entire family ghosted him - they stopped speaking to him abruptly after he climbed out of his third or fourth rabbit-hole to peek at the world and nobody was there one Thanksgiving. His dad left when he was a boy - and women ghost him regularly on the apps. His is a world populated by absence. And Martina is a JFK jr cultist who moved around motels in Dallas-Fort Worth for a few years, showing up every morning at Dealey Plaza to pray. She sees the spirit of both JFK and JFK jr and his girlfriend floating around there sometimes, and she also sees their faces in the faces of other people. Hers is a world haunted by hidden things presencing all the time - she's attuning into the uncanny and sticking there. The ghosts are real. These are worlds that deal in the radical presence/absence of the ideas of the ghost but turn that into a big shared myth-practice with others, not just a psychological condition one suffers through. So the scales are: the ghosts of the self's world, the ghosts of myth-practice (culture's hauntings), and the geopolitical ghosts of security and sense and meaning.

Presenter(s): Joseph Russo

The Creep

In Tennessee we call it the creep, the spooky way that houses tend to shift on their foundations. At my mother's house in the former secret atomic city of Oak Ridge, the way the walls are beginning to separate is alarming. The house was my grandparents', then my mom's, and is now squatted in by my brother. Although it still technically belongs to our mother, she mostly lives with her boyfriend the next town over. My brother moved in there temporarily when he was in a bad way and never left. The house is one of the original prefabs built at the beginning of the town in 1943, a Cemesto B, the second smallest of the so-called alphabets. The architects of the town from Skidmore, Owings, and Merrill didn't really know or care if the community would last past the War. The whole endeavor was thought to be temporary, an experiment. But long after the atomic bombs were dropped, things give off the impression of being intact, both the town and the houses, because bombs turned into more bombs and people just stayed on thinking atomic thoughts while living nuclear lives. Still, nothing lasts forever.

Presenter(s): Lindsey Freeman

Remembering the Dusky Seaside Sparrow

In 1987, the same year the American rock band R.E.M. proclaimed that it was "the end of the world as we know it," the dusky seaside sparrow (*Ammodramus maritimus nigrescens*) quietly went extinct. 'Duskies,' as they were fondly known, lived in the marshes of southern Florida's 'space coast,' chasing insects in the reedy cordgrass. The last bird, a male named Orange Band, spent its final years at Walt Disney World's resort. In this paper, Laura Ogden traces the affective reverberations created when even ordinary species go extinct. In doing so, she offers a model for understanding extinction as a constitutive and ongoing thread in the memory project that is evolution. This paper is based on ethnographic and archival research for Ogden's experimental "The Book of Birds: A Memoir of Extinction."

Presenter(s): Laura Ogden

Clouds cloud

"Clouds cloud" is an opening into the concept work of elemental forms and processes, writing with clouds, helium, lightning and the collembola that carries the bacteria responsible for the scent of geosmin. Clouds put pressure on thought. Which might be experience, but also might be something more distributed, more expansive, or more abstract. Or "thought" as a modern episteme, classificatory, enumerative, "objective." Not necessarily structuring, but holding certain things stable: subject/object relations, empiricism, the presumed certainty of perception. Clouds cloud these, and offer other epistemologies or ways of knowing that blur, fog, disperse, phase shift from the cold hardness of ice crystals to vapor that first obscures bodies and other more or less solid things before drifting away, becoming air newly damp, weighty with humidity. The collembola, colloquially known as the springtail, resists taxonomic schema. It also likes to jump, flipping wildly in the air and landing on its feet almost every time, its movement stabilized by a drop of water held on its abdomen. There is no obvious external motivation for this movement, suggesting it is done

simply for fun. These short pieces are drawn from or inspired by teaching with Katie, with themes like Elemental, Sensitizing Theory, or Object Lessons, seminars that sprawled across things and their unsettled or unsettling qualities, ways of moving and making worlds, their feltness resonating, bending, becoming.

3441 Specters of Authoritarian Anti/Environmentalisms - Part I

Start Date: 11/21/2025 12:45 PM **through** 11/21/2025 2:15 PM

Venue: Marriott **Room:** Studio 2

Type: Oral Presentation Session

This panel seeks to take stock of the global wave of authoritarian politics that has gathered strength over the last two decades with the intensification of neoliberal capitalism, the waging of the wars on terror and drugs, the rise of digital surveillance, the regressive redistribution of wealth, and accelerating resource extraction amidst growing greenhouse gas emissions. This has spurred some sociopolitical forces to embrace different modes of authoritarianism predicated on corporate freedoms, ultra-nationalism, the militarized defense of borders, theocratic patriotism, the enlisting of self-defense as a legal shield to justify the use of violence (both for individuals and countries), and the unleashing of state and non-state forces of repression to secure domestic resources, ensure the sovereignty of national natures, and to stake out geopolitical claims on foreign resources.

Some far-right regimes have condemned climate activism, sustainability, and environmental justice as propaganda pushed by partisan zealots. The rise of anti-environmentalism has become a point of commonality across some authoritarian movements as they seek to undermine socio-environmental rights, roll back environmental regulations and laws, and destroy the expertise of public agencies dedicated to environmental and climate science. In the process, some protected areas are subject to de-gazettement, downsizing, or fragmentation. Biodiversity protections are weakened. Meanwhile, fossil fuels industries can continue with business as usual despite the push for global decarbonization and the pivot toward green capitalism. Fears of stranded assets can be attenuated, at least for a time.

Anti-environmentalist political agendas, however, run into the realities of constitutional orders, entrenched capitalist markets, and sociopolitical forces aligned with environmental protection, modes of care, and advocacy. The need to build political coalitions in government means that anti-environmentalist agendas might be understood alongside new forms of authoritarian environmentalisms that emerge in practice. These may draw upon the legacies of colonialist environmentalisms or advance neoliberal environmentalisms in unexpected directions. These efforts might apply hyper-nationalist politics to conceptions of protected nature through attempts to evict actors, groups, and communities perceived as enemy forces 'polluting' to national lands. Or they might attempt to strip away biodiversity protections while enlisting pro-environmentalist

language to justify these measures. Environmental NGOs might become willing collaborators with these state agencies and corporate partners. These currents of authoritarian environmentalisms can further harness or even spur 'late fascist' environmentalisms.

Presentation(s): Eco-Authoritarianism in Patagonia: Liberated Capital and the Defense of Sovereign National Natures

The election of President Javier Milei has generated significant concern among environmentalists in Argentina. The Milei administration has sought to roll back protections for forests and glaciers, disband the Ministry of the Environment and Sustainable Development, and slash the budget for scientific research. However, the administration has encountered congressional opposition and has been forced to work with coalition parties that have commitments to conservation, protected areas, and environmental law. The result of this alliance between far-right and center-right parties for environmental policy can be seen in the attempt underway to transform the National Parks Administration (APN) and national parks. This paper focuses on the political, economic, and legal measures undertaken by the APN directorate in Andean Patagonia. The discussion focuses on two key measures: 1) deregulation of the tourism industry by targeting the professional tour guiding sector and eliminating the concessionary system in order to 'free' capital; and 2) the move to defend national nature by evicting Indigenous activists who have occupied lands inside parks and branding them as terrorists. I argue that this demonstration of spectacular 'eco-authority'—as an iteration of the far-right theater state—presents itself as ushering in the 'new' or the 'revolutionary,' when in fact it is closely tied to the legacies of settler colonialism and neoliberalism as they pertain to conservation in Patagonia.

Presenter(s): Marcos Mendoza

Nationalism, Nature and Knowledge: Throughlines of Eco-Fascism

Closer attention to the linkages between nation-building, nationalism, and nature is needed in this contemporary moment of rising global authoritarianism and profound planetary ecological transformation. Most often reflected in climate and environmental literatures are the ways in which far-right authoritarian regimes promulgate environmental destruction. Yet while contemporary far-right regimes demonstrate anti-environmental politics, it is also historically evident that environmentalism and fascism are not always at odds but can be mutually enabling. In this paper, I trace the affinities between Germany's Third Reich and the Austrian-German traditions of alpinism

and glacier science during the 1930's–40's, which coalesced around foundational myths of territory, unity and protectionism. Furthermore, this work illuminates how these logics connect to imperialism and colonialism and continue to bear influence in dominant climate imaginaries today. However far afield these histories of Nazi Germany and futuring climate projects may appear, I argue that they are deeply interconnected, and by attending to the past we are in fact care-taking the coming future. Noticing the entanglement of Nazism and environmentalism offers cautionary signposts for rising authoritarian environmentalism and eco-fascism in the age of climate disasters, while centering the role that science and expertise play in this formulation.

Presenter(s): Jamie Haverkamp

A 'Sovereign Energy Transition': Specters of Nation and Coloniality in Mexico

When Andrés Manuel López Obrador (AMLO) became Mexico's president in 2018, peasants in Morelos celebrated. They supported his campaign on the conviction that AMLO would end the imposition of an energy megaproject initiated a decade before against their territory. However, by 2020, the newly created National Guard forcibly dispersed the peasants' protests and stood watch as the companies finished the infrastructure as part of the Mexican "Sovereign Energy Transition," and protestors were called "leftist radicals." Therefore, I ask: What lies in the distance between the hope of a new regime in Mexico (echoed worldwide) and the continued experience of violence against peasant and Indigenous communities? In this presentation, I argue that the reemergence of a nationalist 'energy transition' is in itself a violent socioenvironmental regime that reorganizes the human-nature nexus not only in Mexico but across the world. Through a framework of feminist political ecology and anticolonial science and technology studies, I analyze the emergence of a hegemonic discourse based on the specters of the Nation and colonial visions of the landscape and people. For this historically informed and participatory research, I carried out participant observation at in-person and online events surrounding the imposition of the energy megaproject to understand the material and discursive elements that constitute such a frame of reference and the exclusions it entails.

Presenter(s): Jéssica Malinalli Coyotecatl-Contreras

Raising the Specter of Conflict in Spite of Consensus: The Exercise of Authority in the Galápagos Islands

Known as an Edenic setting for endemic species where ecological processes are brought into sharp relief, the Galápagos Islands have a lesser-known post-Colombian human past littered with geopolitical maneuvering and capitalist interventions. Eras characterized by whaling wars, plantation agriculture, military installations, and market-driven marine resource exploitation have given way to nature-based tourism in the decades following the creation of the Galápagos National Park in 1959. Though the park protects 97% of the terrestrial area of the archipelago, the remaining 3% has undergone dramatic transformation since this Ecuadorian province became uniquely governed by a "special law" created in 1998. Galápagos is now a cultural milieu for approximately 35,000 residents and a destination for 300,000 domestic and international tourists annually. This

presentation shares ongoing ethnographic research in Galápagos, including several consensus analyses and participatory workshops related to tourism and socio-environmental governance. It will highlight how the revolving door of leadership fails to leverage a high degree of consensus among the local population regarding policies and agendas most linked to social and environmental wellbeing while also leaving the door open to neoliberal and deregulatory agendas seeking further economic exploitation of the islands.

Presenter(s): Carter Hunt

Ransoming Protected Areas, Sacrificing Black and Indigenous Territories: The Pursuit of Climate Finance in Authoritarian Nicaragua

A specter is haunting Black and Indigenous peoples in Nicaragua—the specter of climate finance. For more than a decade, the authoritarian Ortega-Murillo regime has pursued financing for its National Deforestation Avoidance Strategy (ENDE-REDD+), which would support silvopastoral systems around protected areas and Black and Indigenous peoples' territories. In those same territories, dozens of Black and Indigenous people have been killed and thousands forcibly displaced as mestizo settlers have colonized their lands, largely for cattle ranching and gold mining. Black and Indigenous peoples' organizations have noted that ENDE-REDD+ will inject capital into the settler ranching industry, which will surely support further colonization. This paper, based on my activist research alongside Rama and Kriol communities, analyzes the Ortega-Murillo regime's environmental policy in Black and Indigenous territories amid the pressures of financial capitalism and U.S. imperialism. I argue that the regime's approach is based less on a coherent environmental politics and more on a set of strategic considerations: 1) The greater the deforestation, the stronger the case for climate financing; and 2) until financing is obtained, political and economic stability are best maintained by supporting the settlers colonizing Black and Indigenous peoples' lands and producing beef and gold for export.

Presenter(s): Joshua Mayer

Sovereign Nature, Sacrificed Rights: Extractivism as Environmental Authoritarianism in Nicaragua

This paper focuses on the dynamics of environmental authoritarianism (EA) in Nicaragua, analyzing how state-led extractivism (e.g., mining, agroindustry) operates under the legitimizing banner of "national sovereignty" and "development." Nicaragua's case is distinct from overtly anti-environmentalist regimes, as the state discursively emphasizes environmental conservation and indigenous territorial rights. However, I suggest that this rhetoric operates as a discursive strategy that subsumes these elements under the dominant logics of extractivist capitalism and state-defined national development. This approach, deeply rooted in Western modernity, frames resource extraction as essential for national progress and sovereignty. Yet, this framing masks environmental degradation and the systematic marginalization of indigenous and Afro-descendant communities' ontologies, territorial claims, and ways of life. This "covert" EA manifests in territorial conflicts that are not only disputes over land use but also over understandings of territory/environment/development, alongside the suppression of environmental-social

movements and the forced closure of numerous environmental NGOs. These actions can be understood as EA, as they impose a singular, state-mandated vision of national interest, obscuring alternative human-nature relationships and implicitly excluding indigenous communities, as the state aims to secure natural resources.

8413 Spectral Legacies:

The Ghostly Presence of Segregated Pasts in Contemporary Louisiana

Start Date: 11/21/2025 12:45 PM **through** 11/21/2025 2:15 PM

Venue: Marriott **Room:** Studio 3

Type: Oral Presentation Session

This interdisciplinary panel explores how, in the past and present, obscured or unacknowledged forces linked to racial hierarchy fetter nominally universalist, race-blind, or egalitarian efforts to address social needs in the state. Racial difference unfolds in interpretive work and emergent contingencies, through which it can be reproduced but also contested and re-cast. But in Louisiana, race is also deeply embedded in long-standing arrangements - settlement and land use patterns, entwined ecological and social infrastructures, cultural politics and social mores, judicial and carceral practices, narrative tropes in public discourse, and more - that haunt the now like ghosts. Often operating systemically and thus silently or partially concealed, the force of race recurs and disturbs ongoing attempts to surmount, ignore, or evade it. Panelists highlight two kinds of moments. The first involves historical episodes when discriminatory practices were inaugurated, producing effects whose impact perdures. The second focuses on more recent episodes when individuals or groups recognize these spectral legacies, as they name them, discern their disquieting impacts, and attempt to address them. Together, these presentations illustrate how the power of racial hierarchy is rendered spectral, pushed to the margins of the state's body politic yet troubling it through the unresolved dilemmas race creates.

Presentation(s): Death's Inevitability Haunted by Ghosts of the Past: Legal Realities, Practical Legacies, and Disaster Chaos in Underprivileged Cemeteries in Coastal

Though death is a universal human experience, marginalization endured by communities of color and the poor has created unique challenges to these universal experiences in Louisiana. This presentation examines the modern regulatory scheme of cemetery management at the state level to identify conflicts with traditional mourning customs and burial practices that continue to this

day. These regulatory inconsistencies are then overlaid onto past and current disaster impacts and interactions with federal disaster recovery to marginalized communities' cemeteries in coastal Louisiana. Past experience of the authors in responding to varied communities impacted during disasters combined with state and federal response practices highlight the complexities that are experienced by these underserved communities through the existing regulatory structure. When a structure that assumes the orderly operation of deathscapes has arisen out of majority (White) experiences in the United States the response to these climate impacts and the complications encountered when those structures intersect with both traditional cultural practices and structural inequality highlights the need for flexibility. Ultimately, these intersections create additional challenges for marginalized communities that make disaster recovery more complex than for more affluent majority populations.

Presenter(s): Christine L. Halling

Co-author(s): Ryan Seidemann

A Tale of Two Basins Revisited: Comparing the politics of race, class, and sacrifice across Atchafalaya and Lower Mississippi River communities

While Louisiana's coastal wetlands are slowly being lost to the sea, this terrain of ghostly loss is also punctuated by newly emerging infrastructural and ecological formations—including river deltas and land created from dredged sediment. However, people of color and economically disadvantaged communities fear that they are being sacrificed for the stability of entrenched interests. This paper presents a qualitative comparative case study of politics across the lower reaches of two rivers in coastal Louisiana, each associated with divergent futures: the Atchafalaya River, which is building land as it empties into the Gulf, and the Lower Mississippi River, which is rapidly losing it. I compare the logics of coastal restoration and flood protection at these two sites, each with deep histories of racialized settlement and dispossession. I analyze how natural resource users, conservationists, political elites, and private interests formed unsteady alliances to advance certain management projects—and how different coastal communities organized in opposition. Tracing management decisions and community activism at important conjunctures across these sites offers insight into the current adaptation dilemmas faced by Indigenous, Black, Cajun, Southeast Asian, and other disadvantaged communities in Louisiana, as the politics of race, class, and sacrifice permeate rapidly changing environments and evolving social and political dynamics.

Presenter(s): Marc David

Immunity as Inheritance: Yellow Fever, Racial Injustice, and the Making of a Segregated City

Archival materials from the Historic New Orleans Collection and the New Orleans City Archives were analyzed to assess the impact of recurrent yellow fever outbreaks in the 18th and 19th centuries on the development and modern geography of New Orleans. Archival data were used to provide time-specific epidemiological, social, and cultural context to the municipal planning and construction timeline. These narratives provide a holistic lens to examine yellow fever's influence on municipal decision-making during this period. Findings agree with the accepted historical

narrative but reveal more nuanced, community-specific impacts, particularly the cultural knowledge and resilience practices developed in response to recurring loss and devastation resulting from outbreaks. New cultural norms and reinforcement of existing social hierarchies were legitimized through pseudo-science by the upper class. These narratives rationalized racial and class-based segregation under the guise of public health. Social, epidemiological, and cultural contexts applied to the city's development timeline show that while yellow fever did catalyze public health reforms, it also served as a tool to codify existing social inequalities. This study contributes to anthropological understandings of disease as not only a biological hazard but also as a social force that can be weaponized through misinformation and existing power imbalances to perpetuate systems of structural inequity.

Presenter(s): Marc David

Forgetting Big Things in a Cursed Town:

The Transposition of Racial Narratives in Louisiana's Public Historical Sphere

By promoting the diverse voices of Louisiana citizens, cultural policies of the late twentieth century promised a more tolerant public culture. Authorities in Louisiana's public historical sphere discerned a history of congenial race relations in the region, whose representation, they argued, would promote racial harmony in the post-segregation era. I explore how these efforts unfolded vis-à-vis Blacks and white ethnic Cajuns, whose past has been the focus of intensive history-making efforts. Through systemic processes that produced the existing regime of historical representation, a remarkable transposition unfolded. On the one hand, this complex centers the historical suffering of Cajuns, highlighting their expulsion from colonial Acadia (now Nova Scotia) and subsequent denigration in Louisiana, followed by their successful integration into the U.S. as a kind of model white ethnic group. The historical representation of Blacks, on the other hand, elides the brutality of slavery and Jim Crow. With notable exceptions, it offers historical narratives of upward mobility and cultural creativity, but not of injustices endured nor of substantive contributions to the body politic. Some have recognized this as a problem, identifying deleterious effects on the cohesion such efforts were intended to foster. In this presentation, I consider their assessments of this ostensibly egalitarian project, featuring the problematic yet largely forgotten outcomes they name as its legacy.

3238 Security Labour: Working towards (In)Security

Start Date: 11/21/2025 12:45 PM **through** 11/21/2025 2:15 PM

Venue: Marriott **Room:** Studio 4

Type: Roundtable/Town Hall

Although numerous studies on security show how security is shaped by questions of labour, having to do with such issues as working hours, working conditions, and relationships with colleagues, the

analytical lens of labour has not been systematically applied to the field of security. In this roundtable, we centralize the experiences of security workers as prime conduits through which to view not only the inner workings of security regimes, but also the effects these regimes have on the people who labour within them. This is relevant considering the exponential growth and diversification of security infrastructures and security-related tasks. Furthermore, in addition to the growth and expansion of the uniformed and formalised security workers within clearly recognized career paths, we also see workers in numerous (non-security) fields who are compelled to engage in practices that aim, in covert/overt ways, to achieve "security". We thus aim to better understand the efforts and practices of labour that are traditionally and commonly associated with security, such as guarding, patrolling, and access control, and the various tasks that are not defined as security, but also centre around security practices, often even pervading seemingly non-security occupations like service work. In this roundtable session, we bring together experts from different ethnographic practices to discuss the opportunities of a research agenda that analyses security as labour. By gathering speakers who have done extensive research in both 'classical' security fields and those that have been 'coopted' into doing security work, we will discuss how ideas and experiences of security and insecurity pervade different spheres of labour and the impact this has for both the individuals working in these industries, as well as the (re)production of global capital circuits of power.

7586 Global Indigeneity in Practice: The Specter of Sovereignty, Settler Colonialism, and Ethnonationalism

Start Date: 11/21/2025 12:45 PM **through** 11/21/2025 2:15 PM

Venue: Marriott **Room:** Studio 6

Type: Oral Presentation Session

With the growth of scholarship on Indigeneity, its complexities, and its implications, there is much to be explored in relation to sovereignty- and transnationalism-based sociopolitical movements on a global scale. Traditionally, these movements have been informed by historical contexts where settler colonialism forms the foundation of indigeneity-based political discourses. In recent decades, however, these frameworks have expanded to include sociopolitical contexts beyond European settler colonialism and are globally transregional. Scholars have begun to use Indigeneity as an emerging lens for understanding a broader swath of ethnic minorities, including Assyrians (Donabed & Tower 2018), Kurds (Demir 2021), Tibetans (Yeh 2007), and ethnic minorities in Taiwan (Sugimoto 2019) and Cameroon (Pelican 2009) among many others.

Indigeneity has been a productive-if sometimes complicated-framing because of the concept's capacity to support political movements and foster solidarity. This panel explores the expansion of the Indigeneity framework and the political effects of its application in several relevant sociopolitical contexts. Haunted by colonial legacies, ethnonationalist projects, recognition politics, and the priorities of global institutions, the theorization of Global Indigeneities prompts engagement with applied ethical research practices and scholarly positionality in relation to a foundational understanding of multilayered histories and contemporary power struggles.

Presentation(s): Whose Languages: Navigating Indigeneity and National Identity in Taiwan

Language holds a center position in the establishment of identities. On the islands of Taiwan, complicated historical developments and immigration have created a diverse language landscape, with Mandarin Chinese serving as the lingua franca, a result of forced assignment from past authorities. To counter China's "Pan Chinese" discourse and the claim of "same language, same race," revitalizing and presenting native languages became a crucial strategy of solidifying a Taiwanese identity and distancing oneself from the Chinese framework. Since the more commonly spoken Taiwanese and Hakka are still under the scope of Sinitic languages, far distant indigenous Austronesian languages and cultures are thus often pushed to the forefront of debate. Long stigmatized and now entangled into the nation-making discourse, the indigenous people of Taiwan skillfully navigate the language landscape not only by living back their mother tongues, but also by adopting new usage and interpretation of the Chinese language on both written and verbal modalities. This paper investigates the ways in which indigenous people construct their agencies through active language practices, and how indigenous sovereignty and identities are negotiated as they participate in a Taiwanese identity, but not falling into service of it.

Presenter(s): Ting-Yu Chou

Reconfiguring Sovereignty: Gond Religion and the Constitutional Mobilisation of Indigenous Identity in Postcolonial India

The Gonds, numbering roughly twelve million, are classified as a "Scheduled Tribe" under the Indian Constitution—a designation that accords them special rights and protections. In south-central India, urban Gond intellectuals have, since the 1980s, actively reshaped their cultural community by institutionalising an indigenous religion known as Gondi Dharam (literally, "The Religion of the Gonds"). The leaders have persistently campaigned for the recognition of Gondi Dharam as a "Tribal Religion" under the Indian Constitution. They present this religion as an alternative form of

sovereignty that challenges the prevailing liberal norms and aims to counteract entrenched legal exclusion in the postcolonial Indian nation-state.

For this presentation, I read selected writings by the Gond leaders, along with their Gondi Dharam-related petitions to the Indian state and legal organisations. Using these primary texts, I analyse how Gond intellectuals mobilise indigeneity as a productive and contested framework, supporting claims for Gond sovereign recognition. Drawing on this Gond case, I illustrate how the formation of an "indigenous religion" unfolds as a means for securing rights, while simultaneously challenging and reshaping existing legal structures. This process, which involves embedding indigenous principles within the framework of the Indian Constitution, contributes to the understanding of broader initiatives of indigenous reconstitution and constitution-making.

Presenter(s): Mayuri Patankar

Emergent Forms of Indigenous Belonging in Authoritarian Settler States

In recent years, more scholarly attention is being given to approaching the study of Tibet's modern history and contemporary experiences under China as a form of settler colonialism. While there are compelling parallels with European settler colonialism, this paper explores some of the divergences in the context of modern China that have implications for Tibetan responses to colonial domination. Based on fieldwork in urban and rural Tibetan communities in China, this paper explores Tibetan experiences of placemaking and belonging amid China's intense urbanizing and assimilatory pressures. A recurring theme in fieldwork is the experience of urbanization as inextricably tied to loss and ethnic transformation. Yet this experience ties Tibetans together in a refusal to disappear as minority citizens within a multiethnic state. Tibetans, whether in China or exile, have historically not "taken up" the position of Indigeneity. But more recently, differently positioned Tibetans in exile have, at various moments, refused, considered, or tentatively aligned with the category of Indigenous and global Indigenous movements. While the question of Indigenous uptake remains for Tibetans themselves to determine, this paper engages with the literature on co-recognition that takes place internally within Indigenous communities. In doing so, I explore how Tibetans invoke affective, Buddhist moral, and other fine-grained categories, such as place, in recognizing each other.

Presenter(s): Eveline Washul

Transnationalism & Kurdish Ethnonationalism: Navigating Shared Territory, Recognition & Coexistence in Northern West Asia

Kurds, Assyrians, Yezidis, Armenians, and several other ethnic groups claim, share, and collectively steward a continuum of overlapping traditional territories in northern West Asia. All of these identities are transnational and reflect the contemporary implications of colonial boundaries drawn in the 20th century that do not acknowledge Indigenous traditional territories. With intimate reference to Global Indigeneity discourse, this paper explores how several ethnic groups are navigating the complexities of land custodianship and stewardship, issues of recognition of Indigeneity, and the multi-layered sociopolitical nuances of shared, overlapping territories in what

is now eastern Syria and Türkiye, western Iran, and northern Iraq. With a primary geographic focus on northern Iraq, and an examination of the implications of Kurdish ethnonationalism on both Kurdish tribes and neighboring ethnic groups, I investigate the question of how these groups negotiate or make legible the concept of shared 'territory' and Indigeneity among themselves and between each other. How globalized discourses of Indigeneity, as well as the ways in which this issue is politicized both externally and among these groups interpersonally, guide these relations is also relevant to how these groups continue to conceptualize their identities and connection to land in the contemporary 'post-colonial' sphere.

1897 Gesture: Citations, resuscitations, and excitations

Start Date: 11/21/2025 12:45 PM **through** 11/21/2025 2:15 PM

Venue: Marriott **Room:** Studio 7

Type: Oral Presentation Session

What is borne, born, or reborn in a gesture? What do gestures carry and what do they create? And what emerges when we attend to the potentialities of gestures across contexts? Gesture has long been a focus for anthropologists studying face-to-face interaction and performance. Linguistic anthropologists, in particular, have developed granular analyses of how embodied significations entwine with speech, frames of participation, and variously-drawn contexts. However, with several notable exceptions (e.g., Lempert 2018; Hall et al. 2016; Streeck 2009), gestures' mediality has hovered in the background of these engagements (haunting them, we might say, in the spirit of this year's AAA theme). Not only do embodied gestures mediate thought, feeling, and memory, but they are also liable to be reproduced and displaced (Streeck 2021) across places, times, and modalities. Writers like Walter Benjamin (2013), Judith Butler (2017), and Giorgio Agamben (1992) have proposed that "citable" gestures can leverage distinct performative and ethical force. Taking a cue from these provocations, this panel seeks to thematize gestures' performativity vis-à-vis their susceptibility to citation, resuscitation, and excitation across modalities, materialities, and spatio-temporal gaps, even as it leaves room for gestures that circulate widely in mediated contexts and yet do not become "quotable" (Kendon 1992). Papers explore the arc of mediatized gestures from "biocommunicability" to "incommunicability" (Briggs), the politics prefigured by digital mediations of a Sikh "exuberant gestural repertoire" (Hothi), the power of experimental-theatrical gestures to "associatively translate" experiences of migration (Giordano), and the performative force of activist-artists' resuscitations and re-materializations of an incendiary salute (Taylor-Neu).

Presentation(s): Elon's Arm: Notes on the Reanimation of Gesture

In early February 2025, Berlin police launched an inquiry into a video that had exploded on social media the week prior. The video, shared by two activist groups, showed another video projected at monumental proportions against the highway-facing wall of the Tesla gigafactory in Berlin's southern outskirts. After first questioning the veracity of the footage, Berlin police condemned the art-action as a violation of Germany's strict ban on Nazi-associated iconography. The grounds? The projection included a clip of Elon Musk's salute during the US presidential inauguration and appended the word "HEIL" to the factory's "TESLA" lettering. This situation—both the reanimation of a gesture and its uptake—raises critical questions about the political and performative force of "citable" gestures. I frame this paper around three such reanimations of Elon's arm. Drawing on documentation and media uptake of art-actions by groups in Europe and the UK, I explore how these actors have sought to redefine the context of Musk's inauguration day gesture and (re)situate it within a larger constellation of emblematic neonazi body movements. My discussion draws on linguistic-anthropological theorizations of gesture, animation, and creative indexicality while also engaging critical theory conversations around "quotable" gesture. From this ground, I argue that these art-actions constitute critical gestural interventions that recast urban and media spaces as the stage of a Brechtian "epic theater."

Presenter(s): Robyn Taylor-Neu

Making the Biocommunicable Body Politic: The Rise and Fall of Fauci's COVID-19 Gestures

Logically, the more gestures circulate and the greater their impact, the more they become citable and quotable. This paper presents an antithetical case. In March-April 2020, Anthony Fauci was omnipresent in White House Coronavirus Task Force daily briefings. He used a recurrent set of gestures that represented 1) "peaks" in numbers of infections, 2) control and mitigation measures, and 3) stable interdiscursive relations between his successive public statements. Other presenters did not devise comparable gestural repertoires. Even as the referential content of Fauci's statements was scrutinized and debated, his gestures were seldom cited or quoted.

Fauci's gestures turned fragmentary, uncertain statistical projections and mitigation measures into seemingly objective, comprehensible objects. His diminutive male, white, professional body became a privileged site for instructing and comforting the U.S. body politic amidst uncertain viral futures. Gestures made COVID-19 seem biocommunicable, able to be transformed into biomedical knowledge and conveyed to lay publics. Questioning official discourse or contributing knowledge branded laypersons as incommunicable, as unable/unwilling to assimilate "the science." When new findings revealed the precarious basis of Fauci's initial guidance, massive space opened for questioning biocommunicability generally. Worse than a "flip-flopper," the right cast Fauci as incommunicable, as a symbol of biomedical arrogance and authoritarianism.

Presenter(s): Charles Briggs

Gesturing Affirmation: Lessons of Prefigurative Sociality in the Farmers' Protest Movement of 2020

On November 19, 2021, a global protest movement prevailed over India's then newly proposed agricultural market reforms. For sixteen months (Aug 2020 - Nov 2021), the "farmers movement" mobilized hundreds of thousands in marches, rallies, occupations, and long-term encampments from Punjab to Delhi. This talk offers an ethnographically grounded investigation into the movement's distinct sociality. An analysis of Sikh social sensibilities reveals key interactional routines enervating the sprawling encampments at the center of the movement. In the Sikh tradition, affective exuberance, or "cardi kala", is a sign of sovereignty, particularly in the initiation, organization, and performance of face-to-face contact. Diasporic mass media offers a key archive to investigate the distinctive exuberance of the farmers movement, offering an opportunity to further probe the distinct affordances of digital archives, the very character of the ethnographic enterprise under the conditions of the coronavirus, and the complex semiotic pathways through which social movements proliferate. At stake in these exuberant gestural repertoires is a prefigurative politics, which cites collective life that is both yet-to-come and yet potentiates the encounter in the here-and-now.

"Can I steal your shade?": On Fieldwork, Minor Gestures, and Associative Translations

[i]Affect Theater[/i], a practice of research and writing theatrical essays which I developed with theater maker Greg Pierotti, emerges at the thresholds of anthropological practices, theater devising, and affect theories. Unlike traditional theater that works with an already written text, devising is a collaborative process where a company draws simultaneously from non-theatrical source material (interviews, fieldnotes, archival documents, etc.) and the elements of the stage (prop, gesture, costume, light, sound, etc.) to write a score. I reflect on gesture as one of the elements of the stage that we engage to "get caught again" (Favret-Saada) in the affective intensities of our empirical material. Gestures also populate fieldwork as empirical moments. How does a gesture encountered during research get woven into fieldnotes? How is it translated into a performance episode to make visible what can only be felt? Are gestures always the performance of a move, or rather the reverberation of the unsaid and unthought in a line of fieldnotes which opens new layers of associative translation? I draw from fieldwork at ports of entry in Sicily where people rescued while crossing the Mediterranean arrive on mercantile ships. Being exposed to the sun during the crossing and at arrival have offered me and those I encountered at the ports moments to experience "shade" as a commodity which was later translated into a theater episode and a gesture which occasioned new analytics of borders.

5630 The Ghost of Whiteness Studies Future

Start Date: 11/21/2025 12:45 PM **through** 11/21/2025 2:15 PM

Venue: Marriott **Room:** Studio 8

Type: Roundtable/Town Hall

The first months of the second Trump administration were marked by a dizzying range of developments, from racial shifts in support apparent in the 2024 presidential election, to disruptions of neoliberal trade regimes, to overt administration support for white South Africans, to sustained attacks on higher education and DEI efforts. This moment has also highlighted a pronounced shift in Americans' perceptions of higher education, including a broad public alienation from the ideological and discursive lenses through which disciplines like Anthropology theorize and describe both contemporary realities and possible political futures.

As South African anthropologist and activist Mamphela Ramphele pointed out in her 2008 book, *Laying Ghosts to Rest*, the rituals used to exorcise the stubborn and lingering ghosts of racism in her context have proven insufficient, and some ghosts are poised to "continue to haunt our future" (Ramphele 2008:10).

Whiteness studies is positioned in a particularly interesting—or precarious—way in this new reality. The overwhelming thrust of scholarship in this body of work has been towards critical descriptions and diagnoses of the harms that whiteness as a racial order has worked in the world. Ramphele calls this the work of naming ghosts, noting that "effective transformation is predicated on acknowledgement of each ghost by calling it by name" (10). This necessary project remains a non-negotiable epistemological-ethical stance for many scholars—perhaps even more so given the developments of the last several months.

However, in a moment of populist cultural politics and rage at elites and elite institutions, pure critique seems insufficient. In addition to the necessity of theorizing and naming harms, we would seem to need new ways of envisioning, describing, and pursuing political futures. What insights might whiteness studies offer into the ways humans exorcise—or coexist among—the lingering ghosts of societal harm? In this roundtable we seek to consider imaginative possibilities for the future of whiteness studies and racial politics more broadly.

In this context, we ask: what might be the shape of a whiteness studies yet-to-come? How do we engage in a political terrain where categories and affiliations are in radical flux? What are the possibilities for coalitional politics that engage the poor and working-class people across racial lines while remaining attentive to the perils of white supremacy? Are such projects unimaginable or anathema to whiteness studies as currently construed? What are our obligations to broader audiences and public impact in times of resurgent neopopulisms? What theoretical approaches to process, becoming, or shifting possibilities might offer new directions in whiteness studies today? How do we articulate a vision of what is to be done that still remains attentive to the perils and ongoing harms of racial and colonial histories?

5579 Playing With Space: Collaborative Place and Space Making for Social Justice

Start Date: 11/21/2025 12:45 PM **through** 11/21/2025 2:15 PM

Venue: Marriott **Room:** Studio 9

Type: Oral Presentation Session

The Dutch historian of play Johan Huizinga's proposition that human culture emerges from games and play (Huizinga 1939/1971) continues to gain traction amongst anthropologists and scholars. Meanwhile design theorists Ken Friedman and Erik Stolterman have more recently asserted that design is a practice that pre-dates the human altogether (Friedman and Stolterman, 2015). This oral presentation session unites five distinct ethnographic practices in conversation around the utilization of community rooted design and games as social change agents. Edward Ruppap (Rensselaer Polytechnic Institute, Research Assistant, Playful Community Development in Arbor Hill) sets the tone for the session through an investigation into the utilization of Participatory Action Research and the ways in which play has continued to assist in the development of social action in the Arbor Hill neighborhood of Albany, New York. Brandon Juan Surtain (Tulane University School of Architecture, Assistant Director of Community Engagement, Albert and Tina Small Center for Collaborative Design) grounds the presentation in the conference's host city of New Orleans, exploring how we rectify the loss of the built environment that fostered New Orleans's Black culture through case studies, community narratives, and possible design interventions. Odin Goldman (Rensselaer Polytechnic Institute)'s game design practice considers the ghosts of Appalachia as both a metaphor and a method. Exploring ghosts as cultural memory, trauma, resistance and kin uncovers a means of retracing the identities of people who have long been pathologized and often erased by a dominant culture of stereotyping. Natan Diacon-Furtado's (Rensselaer Polytechnic Institute, internationally award-winning collaborative artist and designer) presentation engages Brazilian "gambiarra" improvisatory repair culture and globally southern practices of "bricolage." Examples from their own research-creation practice encourage and empower us all to engage in the liberatory re-use of space and meaning. Revealing, re-framing and laying claim to the built environment outside and within ourselves. Our final presenter, Jayden Montalvo, explores how board games, such as Vagrantsong by Wryd Games, and their players form a material and experiential site where human and more-than-human agents combine to form a larger spectral ecology. Revealing the role of nonhuman-agents as reflective surfaces for players' confrontations and imaginations with their social identities and projections of other players. Across these five presentations the authors explore the tools, myths and rituals that collaboratively make and remake space while embracing the spirit of social justice, civil rights, and decoloniality.

Presentation(s): Playful Spaces in Disadvantaged Communities: Play and Social Action in Arbor Hill

The authors have investigated the ways in which play has assisted in the development of social action in the Arbor Hill neighborhood of Albany, New York. Arbor Hill is a disadvantaged community where people have been historically discriminated against, disinvested in, and poverty stricken. Our research spans the University Albany's archives on The Brothers civil rights group from the mid to late 20th century and the past and present locations in Arbor Hill where people play together. This research is on-going but details the prevalence of play in social justice and civil rights action in Arbor Hill and how the presence of playful space, and barriers to it, has been influential to the wellbeing of the neighborhood. Present findings include playful discussions of issues through the Albany Liberator and the centrality of recreation to its authors who wrote about playgrounds, parks, and athletic facilities alongside the political turmoil and civil rights protests of the late 1960s and early 1970s. After situating our research project historically in Arbor Hill we have reached out to local stakeholders, particularly at the Underground Railroad Education Center in Arbor Hill, to utilize Participatory Action Research methods in involving the local community in designing playful community building methods.

Co-author(s): Nicholas Mizer

Rectifying the Physical Disappearance of the Built Environment that Fostered New Orleans' Black Culture

How do we rectify the loss of the built environment that fostered New Orleans's Black culture? This presentation will examine historical patterns of erasure, the cultural cost of redevelopment, and the present-day impacts of disconnection from place. Case studies, community narratives, and possible design interventions will aid in uncovering the spatial typologies and social infrastructures that made Black cultural expression possible and what is lost when those disappear.

Shaped by centuries of resilience, creativity, and community, New Orleans's Black culture has always been intimately tied to its built environment. From shotgun homes and corner stores to second-line routes and social aid halls, physical spaces have played a defining role in nurturing Black life and culture. Yet, systemic disinvestment, urban renewal, and post-Katrina redevelopment have eroded these environments, displaced communities and severed the spatial fabric that once sustained cultural continuity.

This work seeks to help inform strategies that prioritize cultural preservation through equitable development, participatory design, affordable housing, and heritage-based planning. We'll look at emerging models that combine cultural memory with future-oriented design, and question who holds the power to define, preserve, and rebuild.

In a city that celebrates, honors and talks with its dead, where are the monuments to the black people and places integral to the culture and ethos of New Orleans?

Presenter(s): Brandon Surtain

Hauntologies of the Holler – Using TTRPG's as a Framework to Reclaim Marginalized, Appalachian Identity

In the hills and hollers of Appalachia, ghosts are cultural memory, trauma, resistance and kin. Through an analysis of an "alternate Appalachia," as it has been shaped by games such as *Old Gods of Appalachia*, a gothic horror exploring the realms of natural horror influenced by the land's ecological history, and *Scarlett Hollow*, a visual novel about interpersonal relationships in a tight-knit community of a declining mining town, it is possible to see the ways story shapes community. The author's own *Nothing Worth Dying For* is a play-by-mail game influenced by the history of Tabletop Roleplaying Games (TTRPGs) that weaves together themes of gender, chronic pain and rural estrangement into the mythic and material landscapes of Appalachia. Here, linear time unravels and bodies are not fixed but shifting, entangled with land and story. Players witness characters navigating these themes, communicating across uncertain gaps in time and space. Through this slow, analog format, *Nothing Worth Dying For* troubles normative rhythms of play, offering instead a durational, fragmented narrative practice that honors slowness, absence, and the messy labor of connection. By considering the ghost as both a metaphor and a method, this presentation will uncover a means of retracing the identities of people who have long been pathologized and often erased by a dominant culture of stereotyping.

Presenter(s): Odin Goldman

Improvised Tools / Improvised Play - Ancestral Projectors and the Liberatory Re-use of Space

"Ancestral projectors" from the author's own research-creation practice "assemble the [technologically] improbable" (Montagner and Lopes, 2022) to recuperate (Jiménez Oviedo, 2022) spiritual and ancestral technologies and practices of our pasts. Engaging Brazilian "gambiarra" (Lagnado, 2007 and Montagner and Lopes, 2022) improvisatory repair culture and globally southern practices of "bricolage" (Lévi-Strauss, 1962) and "epistemological pluralism" (Turkle and Papert, 1992) the author collaborates within communities of all cultures, abilities and means to recover and project othered imaginations. As stated by the activist healer and writer adrienne maree brown, "[w]e are living in the ancestral imagination of others, with their longing for safety and abundance, a longing that didn't include us, or included us as enemy, fright, other." (maree brown, 2017) Utilizing light and sound to project the possible futures already present in our pasts, "ancestral projectors" are assistive technologies that aid in re-linking sensed knowledge that has been violently un-linked from each of us. Examples discussed utilize accessible and open-source folk hardware and

software interfaces to aid in the liberatory reuse of over-cultural public space for collaboration with our more-than-human communities and laying claim to the spaces and meanings around us.

Presenter(s): Natan Diacon-Furtado

Vagrantsong: Liminal Spaces For Wandering Subjects and Spectral Ecologies

Vagrantsong by Wryd Games is an anthropologically potent liminal space: It is a cooperative tabletop game where players imagine themselves encountering southern spirits aboard a haunted train. The game designers work with potentially problematic language of "haint," "vagrant," and "hobo" to position players into a Southern mythos exploring poverty and spirituality. Players train hop as "vagrants", which are coded as romantic wanderers or the hobo. However, this life of wandering, rather than being brought to a halt, sees players and their characters thrust into moments of reflection on their activity by the weird positionality of players, vagrants, haints, spirits, and events on a ghost train—which acts as a game board and setting for the narrative. Vagrantsong enfold players into a site of transformation, uncertainty, and spiritual entanglement, with the setting of the spirit train, narrative, players, and game mechanics. Drawing on Chloé Germaine's microethology and descriptive phenomenology (2025), this paper explores how board games and their players form a material and experiential site where human and more-than-human agents—miniatures, the hobo code or other game rules, and spirits—combine to form a larger spectral ecology. Revealing the role of nonhuman-agents such as the haints, who are not merely spectral antagonists, but reflective surfaces for players' confrontations and imaginations with their social identities and projections of other players.

2646 Body-Place Attunements: Sensitivity Beyond the Self

Start Date: 11/21/2025 12:45 PM **through** 11/21/2025 2:15 PM

Venue: Sheraton **Room:** Edgewood AB (4th fl)

Type: Roundtable/Town Hall

Where does the (self-)body end, and where does the environment start? In this roundtable, we dwell in the body's porosity, as a place that testifies against containability or demarcation. Invisible chemical exposures permeate our food and water (Liboiron 2021). Skin absorbs toxins and radioactive waves. Our very breath we share with people in the same room. Then, there are also presences that haunt us in their liveliness – intergenerational trauma in families, bureaucratic structures, the animals we try to exterminate (Todd 2014), the mold that insidiously cover the walls. We experience these hauntings through our bodies' visceral reactions to them – pain, rashes, blood, pleasure and excretions. The dead also linger within us and our worlds in numerous ways - as food, smells, rituals, and even through screens and videos (Beliso-De Jesus 2015). Ephemeral exposures permeate life and contaminate it. The presence of trauma is only knowable through our bodies, and yet the act of sensing engraves the other upon us. In such ways, we are entangled in

messy multiplicity, and we must employ numerous multisensorial forms of attunement to engage with them.

We therefore ask: 1) When are moments when invisible, illegible conglomerates of haunting become visible and palpable? What are the bodily symptoms or happenings and how do we attune to them? 2) How can we navigate and negotiate bodily knowledge and haunting that not only manifest in our interlocutors, but also through our multisensorial attunements to/with them? 3) How do our interlocutors and fieldwork haunt us, even after we "leave the field"? 4) How do we navigate the double-bind of our sensitivity, as it grants us understanding and attunement, but also challenges us with vulnerability?

In this round-table, we reflect on ethnographic examples of unseen exposures, and the methodological improvisations that are needed to find attunement to them, to make them known. If conspiring is the act of breathing together – sharing in conditions and in action – then aspiring is the act of daring to claim and make space, to reimagine and transform air through ethics of care and of being (Sharpe 2016). We aspire to inquire on the boundaries of institutional hauntings (family, vocation, housing, culture); intercorporeal or bodily hauntings (family, skin, pain, food, exposure); and porosity as the imperfect boundary separating the two. We encourage our participants to share short ethnographic or narrative excerpts, and then to reflect on the methodological quandaries of studying imperfect sensorial capacities and shifting bodily boundaries unknowable and otherwise.

3742 Inquiries into enoughness in business, finance, and extractives

Start Date: 11/21/2025 12:45 PM **through** 11/21/2025 2:15 PM

Venue: Sheraton **Room:** Estherwood (4th fl)

Type: Oral Presentation Session

Degrowth is a sociopolitical movement that encourages the limitation of endless extraction, production, and consumption (Hickel 2020, 2021). It has been strengthening its position as a viable solution to big environmental and societal challenges that await our communities, such as climate change, deforestation, and social inequalities (Nicoson 2021; Creutzburg 2022; Whyte 2023). Despite its strengths and allure for creating a more just, equitable, and sustainable society, degrowth remains a niche stance with only a handful of jurisdictions embracing its methods and requirements (Savini and Bossuyt 2022; Kallis 2023; Parrique 2023). In fact, institutions and sectors with the most power to meaningfully alter societal workings for the better (e.g., finance, policymaking), vehemently oppose any mention of degrowth thinking it a career suicide or a kamikaze mission.

Reluctance of our most powerful industries and institutions to give degrowth a chance opens up the questions about enoughness (Sachs 2008; Edlinger et al. 2021; Hromek and Porras 2023): What is enough and when is enough? How can we say enough? At what point do these powerful institutions and actors deem their gains, or harms generated, enough and decide to shift course of action, or fail to do so? Today's discussions about climate change and other environmental and social issues are more than anything about being able to deem a certain degree of gains and harms enough, and changing behavior and policy. Yet, oftentimes, even when they claim to pursue a more sustainable world, these institutions fail at considering and applying the concept of an enough into their activities involving extraction and accumulation.

By bringing together scholars of business and finance, extractives, and public policy, this panel seeks to explore the trials at claiming an enough, and the subsequent failures or successes. All of these sectors in their own ways are fundamental to disseminating a mainstream disposition favoring enough and redirect our socioeconomic systems towards more sustainable and equitable extraction, production, and consumption relations. In investigating how they enact and employ a framework of enough, the panel not only demonstrates some of the biggest roadblocks but also endeavors to outline what an otherwise would look like (Cooper 2014; Tibaldeo 2019; Blanco-Fernandez 2024).

Besides inviting dialogue between anthropologies of business and finance, extraction, and policy and indigenous knowledge (Adamson and Klinger 2008), this panel also aims to reach back to our anthropological predecessors for further insight. By opposing the imagining of production and consumption as linked to the insatiable desires of individuals and instead placing them back in social processes and cultural meaning worlds (Mauss 1925; Boas 1966; Douglas and Isherwood 1979) and by emphasizing that our ideas of affluence and abundance are products of our sociocultural contexts (Sahlins 1972).

Presentation(s): Commensuration: Sustainable finance response to the problem of growth

Sustainable finance institutions claim to address our environmental and social problems, such as climate change, deforestation, or social inequalities. In theory, their capacity to channel funding towards sustainable companies and investments allows them to enact a care for the environment and the society, which involves deeming certain gains and harms enough. However, as representatives who are obligated to ensure profits for their clients, they cannot opt out of incessant extraction and accumulation. Oftentimes, their sustainability sensitivities end up yielding

to a sustainable finance ethics that tries to care for the environment and the society without giving up on its profitability onus.

This sustainable finance ethics predominantly relies on the commensuration of investment outcomes even when they seem incommensurable. In studying the investment practice of a sustainable asset manager in Norway, particularly around the Norwegian government's attempt to start commercial deep-sea mining and the ongoing worker strike against the electric carmaker Tesla in Sweden, I aim to show: How can an industry, which can practically never say 'enough,' contribute to the well-being of our planet and communities, as it claims to do so? How is this commensuration logic, which replaces the ability to say enough, enacted and embraced in the daily practice of sustainable finance institutions? What impossibility of sustainable finance does this commensuration logic conceal?

Presenter(s): H. Nazli Azergun

Reimagining Leadership of Degrowth: Reframing Scarcity and Enough

Traditional business leadership paradigms often reinforce the mantra of "more with less", equating success with expansion and productivity and confusing efficiency and effectiveness. The degrowth movement challenges this growth-centric ideology, arguing that perpetual economic expansion on a finite planet is unsustainable and will inevitably lead to crisis (Weiss & Cattaneo, 2017). Despite this, the notion of degrowth remains anathema to many business leaders (Roulet & Bothello, 2020).

This paper explores how leadership can redefine growth by embracing the concept of 'enough' – a threshold beyond which accumulation becomes counterproductive – shifting the focus to longer term effectiveness. It examines how leaders shape the boundaries of sufficiency: What constitutes 'enough' for employees, communities, and organizations? How does organisational culture influence these limits? And power dynamics influence decisions?

By exploring the tension between the necessity of increasing profit to sustain a business and the risks of falling into the more and bigger traps of extractive capitalism we seek to contribute to an alternative vision of leadership that prioritizes ethical responsibility and ecological balance over relentless expansion. Rather than framing scarcity as a deficit, this paper argues for an abundance mindset (Freebairn-Smith, 2023), reimagining degrowth leadership recognizing sufficiency, redistribution, and creative use of existing resources.

Congestion Conversations: Efficiency and Politics in an Eastern Mediterranean Port City

Maritime movement has been essential to current moment of capitalism, marked by the optimization of supply chains. Seaports continue to scale up tremendously, however, blockages, delays, and congestion persist and even multiply, complicating accounts of private capital unleashing an increasingly frictionless world. Based on research with logistics professionals in

Mersin, Turkey (host to a privatized port operated by Singaporean state-held corporation PSA), I show how port advocates explain the recent growth in the port's trade volume as efficiency seems to increase under privatization. And yet, all around Mersin, talk about congestion in cargo movement will not stop. As parties disagree over whether congestion is a humanmade problem fixable by efficiency measures, or a near-inevitable reality of maritime trade beyond anyone's immediate control, congestion becomes the terrain of politics—an exercise in designating objects of public governance. Through congestion conversations, many reflect on how wealth from maritime trade should flow, and which frictions stand against more prosperity and a more equitable distribution. In a port city, growth may manifest as an apolitical theme that all parties favor for the purposes of wealth creation. The physical frictions in the supply chain, on the other hand, cause political rifts to appear. Congestion is the terrain where the fault lines of diverse political imaginations appear across the various publics of supply-chain capitalism.

Lithium demand as fiction? Approaching the relationship between 'the imaginary' and 'the real'

Lithium has emerged as a central element in global political, economic and cultural imaginaries of energy transitions, promising both environmental sustainability and economic growth. In Europe, the discourse around the need to onshore lithium value chains continues to shape political agendas, even as its real dimensions remain elusive due to economic speculation and shifting demands in battery materials. By

studying lithium from historical, cultural and political perspectives, this paper explores the relationship between the discursive and the real with an emphasis on how the concept of enoughness is framed within these orders. While historic and contemporary imaginaries point to lithium as a more-than-ever needed prophylactic-curative material (e.g. against psychological disorders and for combatting climate change), lithium projects 'in the making' reveal contradictions and power dynamics that remain hidden in dominant discourse. Ethnographic research on a planned lithium project in the German Ore Mountains highlights how the imaginary shapes socio-ecological relations, even if it may never become real. Enoughness in this context is either understood as a shift away from fossil fuels and geopolitical dependency, or as an ethical-political stance against endlessly expanding energy and economic systems. We thereby situate lithium onshoring as a pillar of symbolic/real orders of energy transitions and challenge taken-for-granted assumptions about techno-centric solutionism.

How much mining is enough? Lessons from resource extraction and its impacts on people and place

The twin crises of planetary climate change and global financial swings have resulted in an unprecedented level of mineral resource extraction. On the one hand, mineral extraction is

promoted as a way to move towards a "green" transition as humanity seeks a low-carbon energy future dependent upon electrification and battery storage instead of fossil fuels. On the other, the vicissitudes of the global economic system impel people to invest in gold which provides the logic for more exploration and extraction of a resource which we already have in great abundance (i.e., more than enough for industrial purposes). Both of these movements foster a particular mode of being, "extractivism," which has become a global organizing concept for societies in the 21st century. Various scholars, including myself, have highlighted extractivism as a particularly violent and subjugating form of life. In this presentation, I reflect on 30 years of studying resource extraction and its impacts on people and place. Given these experiences, anthropologists are well-positioned to comment on the question of how much mining is enough. Can we really mine our way to sustainability and what are the implications of pursuing such an objective?

3250 Imagining Disabled Anthropologists: Haunting Ableism in the Field

Start Date: 11/21/2025 12:45 PM **through** 11/21/2025 2:15 PM

Venue: Sheraton **Room:** Gallier AB(4th fl)

Type: Roundtable/Town Hall

This roundtable celebrates the publication of the book, *The Disabled Anthropologist* (2025). The title, while it could be understood as essentializing, has value in asserting and affirming our presence and calling for desired transformations (Moodie 2025). This publication is the first of its kind and incorporates a spectrum of academic positionings (from graduate students to senior anthropologists), embodiments, and perspectives. The chapter contributors share their ingenious and creative methods and strategies for engaging in their work and underscore ways in which their diverse bodyminds have contributed to insights about what constitutes the field, ethical considerations about engagement with field interlocutors, and how they have envisioned and enacted their scholarly endeavors. Through the deployment of their own imaginations, authors and roundtable participants hope to excite the imaginations of others, demonstrating that the doing of anthropology doesn't require "intrepidity" (Black 2025). The book and the roundtable haunt the ableism that continues to pervade our field by establishing that disabled anthropologists, however unacknowledged, have been here all along, like ghosts, challenging and unsettling the received knowledge and practices of the canon. In so doing, we hope to enjoin our anthropological compatriots to envisage and shape a more inclusive, more flexible, and less audacious discipline, a goal that will be more easily achieved if others recognize our wisdom and let us guide them. All the contributors use autoethnography to impart their experiences and astuteness, mostly through narrative but also via poetry and photography. They explore how the mythos of anthropological fieldwork initially informed their understanding of how to conduct fieldwork, and then their discovery of alternative and appropriate methodologies, such as the design of an ethnographic methods class built on the principle of collective access. Many contributors address the significance of mutual care, bonding, and/or mutual aid between the anthropologists and their

interlocutors in making fieldwork possible and yielding fruitful insights, according themselves and their interlocutors "value." Others evaluate how "pain time" can fundamentally disrupt ethnographic processes and academic responsibilities, rendering hyperproductivity unachievable and undesirable. Roundtable participants will discuss their initial impetus for involvement in the book project; how their essays play a part in haunting ableism in the field (both in terms of identifying obstacles posed and realizations made); how the act of reflection and composition deepened or altered their views on this haunting; how they best think the specter and manifestations of ableism can be eradicated in this disciplinary context; and, finally, examine what genuine "recognition" looks like.

1232 Real Ghosts?! Not Metaphors, Not Hauntology, Not Derrida

Start Date: 11/21/2025 12:45 PM **through** 11/21/2025 2:15 PM

Venue: Sheraton **Room:** Grand Ballroom A-C (5th fl)

Type: Executive Oral Presentation Session

In anthropology, ghosts are often understood as cultural symbols, historical residues, or figures of social haunting. Yet, for many, ghosts are also social actors-inhabitants of lifeworlds, interlocutors, and kin. This panel explores what it means to move beyond representing ghosts as metaphors and instead take them seriously as part of the social realities we study and inhabit.

Anthropologists have long walked a fine line between respecting their interlocutors' beliefs in spirits and maintaining analytical distance. Evans-Pritchard's *Witchcraft, Oracles, and Magic Among the Azande* offers a classic example of this epistemic move, where he first appears to "believe" he has seen a ghostly light, only to later assure the reader that it must have been a lantern. More recent work, such as Jon Bialecki's engagement with Bruno Latour, has called for taking spirits as social actors-without necessarily breaching the wall of methodological atheism. This panel asks: What if we do breach that wall? What happens when anthropologists, too, can see ghosts?

Bringing together scholars who not only study spirits and ghosts but also share lifeworlds with them, this panel examines how such relationships reshape ethnographic writing. It considers the forms of storytelling, voice, and methodology that emerge when spirits are not just objects of analysis but co-authors of our worlds.

Papers in this panel engage with ethnographic, theoretical, and experimental approaches to these questions, addressing topics such as:

- Ethnographies of ghosts and spirits as social actors
- Writing beyond methodological atheism
- The presence of spirits in fieldwork, analysis, and writing
- Mediumship, possession, and cohabitation with spirits
- Anthropologists' own experiences of being haunted
- Non-human kinship and multispecies hauntings
- Experimental ethnographic writing engaging with the spectral

This panel aims to foster a conversation about the limits of anthropological knowledge and the possibilities of ethnographic writing when ghosts are taken as real, not just as symbols but as presences that shape our fields, our texts, and our lives.

Presentation(s): Beyond the Visible: Jinn, Dreams, and Spiritual Encounters in contemporary Iran

In contemporary Iran, jinn—referred to as *az ma behtaroon*: از ما بهتران (literally "better than us")—are believed to possess extraordinary abilities: they can travel across time and space, perceive what humans cannot, and access knowledge beyond human reach. These beings sometimes intervene in human lives, acting as protectors or as intermediaries between the human and non-human realms. They communicate through messages, offer glimpses of the future, and enable individuals to see things that are otherwise hidden. These interactions often occur through vivid dreams, whether by night or day. While some may regard these beliefs as remnants of folklore, for many Iranians, jinn remain an integral part of daily life and are felt or seen in various forms—whether as humans, smoke shape creatures or animals. During my ethnographic fieldwork, my interlocutors shared personal stories of encounters with jinn in different contexts and manifestations and the results of these encounters which varied from illnesses to activating their third eyes. In this talk, I dive into the relevance of jinn beliefs in contemporary Iran and the way these encounters with jinn are perceived by individuals from different genders, ethnicities, and religious backgrounds.

Of Blithe Spirits: Narratives of Rebellion, Violence, and Cosmic Memory in Haitian Vodou

Spirit mounting/possession in Haitian Vodou offers a profound connection to the violent history of the Haitian Revolution. Violence here is not about destruction but refers to the voluntary surrender that Vodouisant/practitioners experience to make space for the lwa/deities to spiritfuse. The body as conduit becomes the subject and object of sacred action, submitting to the lwa like a horse yielding to its rider. This study draws from my engagement with the lwa while they inhabited

Vodouisant, showing how the lwa are not distant, detached deities but living forces who take full control of both body and soul. In this context, the violence involved is redemptive—reshaping cultural, historical, and metaphysical realities. Through mounting, practitioners transform—cognitively and spiritually—as they shift from passive submission to active participants in this transdimensional evolution. This journey blurs the boundaries between human and divine, as the lwa mold and guide them. My interviews with the lwa during rituals at an hounfor/Vodou temple in Little Haiti, Miami, emphasize the centrality of mounting. Moving away from Eurocentric notions of possession, I approach mounting as sacred, reciprocal, and cohabitative. Mystically tied to the Haitian Revolution, conjuring and embodying the dead serve as links between spirituality, insurrection, and ritual resilience, offering a nuanced perspective on violence, endurance, and the broader implications of rebellion.

Haunted Minds, Haunted Homes: A Spiritualist Perspective on Lingering Spirits and Psychological Vulnerability

Spiritualism was sparked by two young girls and a noisy spirit unsettling the status quo. Emerging at a time when revivalist movements were sweeping America, Spiritualism offered an alternative rooted in human potential. Whilst traditional religious authorities controlled scriptural knowledge, spirits could speak to anyone. But how do Spiritualists make sense of spirits and their continued existence in the 21st century? Based on fieldwork amongst a Spiritualist community in north London, this paper explores hauntings from a Spiritualist perspective by drawing on the experience of a family being disturbed by a spirit. Far from a Derridean 'absence' or a Freudian 'concealment', the affective presence of the spirit demands action by attaching itself to a family member due to a perceived lack of mental robustness. This is interesting because Spiritualists work hard to actively break down the boundaries of the mind to engage in mediumship. This is illustrated through an unsettling autoethnographic encounter with a spirit shortly after the author began mediumship training, requiring the implementation of resilient mental boundaries. This paper therefore demonstrates the necessity of control over 'mind' for Spiritualists to prevent spirits – as individuals with agendas of their own – from causing harm. For Spiritualists, hauntings present an interlinking of psychological and otherworldly domains, reflecting a broader metaphysical ordering of reality they experience.

Presenter(s): Connie Jones

On Gaining Informed Consent from a Mountain Spirit

Modern anthropological ethics are founded on the idea that human subjects of our research have a right to be informed that the ethnographer wishes to conduct research about, with, and among them, that said research will be carried out only with their consent, and that they thus have a right to agree or decline to participate. As more scholars have become interested in and started practicing what has variously been called a multi-species or post-human anthropology, though, might it be reasonable to ask who (or what) else we should seek informed consent from? If we are

to take seriously the idea that the subjects of our studies are not just human beings, but also the other-than-human beings with whom we share the world, and if we wish to understand those beings as imbued with some of the same qualities of agency and cognition as humans, should we not address them before beginning our research? Wanting to respect the sovereignty that my Q'eqchi'-Maya human interlocutors afford mountain deities known as Tzuultaq'as, in 2024 I did just this. Through a series of ceremonies officiated by a Maya ritual specialist, I explained to the spirits the nature of my work, asked for permission to conduct it, sought their counsel for how to do it effectively, and ultimately offered them thanks for allowing me to do so. This paper asks what consequences conceptualizing other-than-human beings as real social actors and agentive stakeholders to whom we owe certain rights has for anthropology.

Presenter(s): Eric Hoenes del Pinal

Wittgenstein among the Santeros

Proceeding from a perspective guided by Wittgenstein's "second philosophy", this essay aims to probe the limits of the ethnographic endeavor vis a vis worlds unthinkable in terms of the ethnographer's own "hinge propositions" around which doubt can turn, but which cannot themselves be allowed to fall into doubt. To do so I revisit a set of ethnographic data from my first fieldwork among practitioners of Afro-Cuban ritual traditions in Miami where I was repeatedly told that the spirit of a dead slave named Tomás was watching over me. I had originally used the "idea of Tomás" as an analytic device to establish my own implication in a violent Atlantic modernity whose (however unwitting) heir I, like all "moderns", am. Here, however, I explore how a Wittgensteinian approach may help us overcome a facile representationalism, give the dead – Tomás, no less than Wittgenstein – a place in the scaffolding of our mind, engage them as metapersons, and so perpetuate their presence in our worlds or forms of life.

4093 Council on Anthropology and Reproduction Advocacy: Reproductive and Environmental Justice in New Orleans and Beyond

Start Date: 11/21/2025 12:45 PM **through** 11/21/2025 2:15 PM

Venue: Sheraton **Room:** Grand Ballroom D (5th fl)

Type: Roundtable/Town Hall

The Council on Anthropology and Reproduction (CAR) is holding a special advocacy roundtable to address the complex interfaces of reproductive justice and environmental justice. In this context, the conference theme of "ghosts" resonates powerfully, calling attention to the generational hauntings of environmental contamination that often remain unseen yet manifest in reproductive outcomes. Our meeting in New Orleans--situated in a region both vulnerable to storms and hurricanes and infamous for industrial pollution--offers a critical opportunity to examine how

pregnancies, births, losses, and maternal/infant health bear witness to the slow violence of environmental racism.

At the core of Reproductive Justice is the belief that all people have the right to have children, the right to not have children, and the right to nurture children in safe and healthy environments—principles that are inherently interconnected. Louisiana has one of the highest rates of maternal mortality in the U.S., which itself has some of the worst outcomes among wealthy industrialized nations. Communities of color bear this burden disproportionately, experiencing the compounding effects of environmental racism, obstetric violence, and economic extraction across generations. In New Orleans, researchers and advocates at the forefront of reproductive and environmental justice movements are working to confront the multiple intersecting catastrophes of climate crisis, environmental degradation, and systematic assaults on reproductive rights and care.

Drawing on CAR's long history of anthropological engagement with reproductive politics and justice, this roundtable brings together local scholars and advocates working at these vital intersections to explore:

- How have reproductive justice and environmental justice emerged as interrelated movements in New Orleans and beyond? What intersections have anthropologists illuminated, and what work remains in making visible the carcinogenic processes and pollutants of structural violence?
- What role has academic research—or lack thereof—played in supporting or silencing these co-arising justice movements? What successful partnerships between researchers and advocates can serve as models, and what uncharted avenues exist for future collaboration?
- What specific lessons can we learn from New Orleans advocates and activists who have shaped these frameworks and movements locally while contributing to national and global discourses?
- In the face of accelerating climate disaster, what are the most pressing challenges to reproductive freedoms, particularly the right to raise children in safe and sustainable environments? How can anthropologists better support communities confronting the lived effects of environmental racism and climate crisis?

1966 The Living Dead, the Living Landscape, and Other Nonhuman Agents in the Maya World (Part I)

Start Date: 11/21/2025 12:45 PM **through** 11/21/2025 2:15 PM

Venue: Sheraton **Room:** Grand Ballroom E (5th fl)

Type: Oral Presentation Session

What a western framework often labels as ghosts, apparitions, spirits, and specters inhabit the world with us, but they are called different names by different cultural groups. As such, how these groups relate to them also varies from western imaginings. In the Maya world, which spans across the countries of Mexico, Guatemala, Belize, and parts of Honduras and El Salvador, these entities still permeate through an imposed reality that stems from the colonial era. Starting in the 16th century, Indigenous groups of Maya descent were subjected to destabilizing colonizing forces in order to assimilate them to a Christianized way of viewing the world. Often, colonizers labeled these nonhuman agents as demons that needed to be purged from Indigenous minds, bodies, and souls. In Maní, Yucatán, Mexico on July 12, 1562, Friar Diego de Landa commissioned an auto da fe, in which "thousands of sculpted deity images and associated ritual paraphernalia," such as hieroglyphic codices, were burned (Christensen 2016, 22).

Yet, neither fire nor time could destroy these nonhuman agents, as they still inhabit the world—for instance, as features in the landscape. In this interdisciplinary session—split into three parts—we examine the myriad of nonhuman agents who populate the Maya world and regularly engage with human communities, as ancestors, deities, earth spirits, guardian angels, and other powerful beings. Using perspectives rooted in all four anthropological subfields and related disciplines, participants will examine how the Maya conceive(d) of, engage(d) with, and depend(ed) upon these beings in the past and present. Part 1 will focus on the living dead. Particularly, how the Maya interacted with their real and imagined ancestors, from regular ritual offerings to incorporating the dead into the foundations of houses and other structures. Part 2 will focus on the living landscape, from guardian spirits of specific domains to how statues were treated as living humans. Part 3 will focus on a wide range of other beings who populate the Maya landscape, from living mountains to the spirits of unborn children.

Presentation(s): Ancestors and Arenal: The Role of Ancestors in the Foundation of the Preclassic Maya Center of Arenal

Past and present Maya communities engage with ancestors and nonhuman beings in many contexts. The presence of ancestors is often important for the foundation of Maya communities, and archaeologically, we can see that relationship between communities and ancestors through ritual deposits. In this paper, we use evidence from the Preclassic center of Arenal, Belize to discuss the role of ancestors in the founding of the site and its continued occupation. The residents of Arenal interred their ancestors within the site center and revisited those ancestors, taking and

leaving materials associated with them. The deposition of a large concentration of stone and shell objects in the same areas as these ancestors illustrates the importance of animate, nonhuman beings in these activities. Additional ritual offerings of other animate materials, like jade, illustrates the importance of these objects and practices at Arenal. We will discuss the role of ancestors and nonhuman beings, illustrating that these individuals were important for establishing the community itself, as well as for the continued operation of the community of Arenal through time. Members of the Arenal community maintained a dialogue with ancestors through time through ancestor veneration practices.

Missing Mothers and Venerated Ancestors: Genealogical Depictions and Omissions by Maya and Mestizo Interpreters in Sixteenth-Century Yucatan

During the sixteenth century, ancestry figured prominently in the selection of translators of Spanish rule in Maya lands. The cohort of these *lenguas* included Spaniards, mestizos, and Mayas. A fortunate few parlayed political connections and literacy and fluency in Yucatec Maya, Spanish, and often other languages into securing the most prestigious translation post in the province, interpreter general. Descent influenced the selection of these intermediaries, though strategies differed between Maya and mestizo contenders. A stark difference emerged between the genealogical emphases of the best-known Maya translator, Gaspar Antonio Chi, and the three primary mestizo translators. In his family tree, Gaspar Antonio included his own mother, Ix Kauual, and highlighted his maternal line, the Xiu dynasty. By contrast, three mestizo interpreters general emphasized their conquistador fathers' service to the crown, omitting their indigenous mothers in their appeals for confirmation interpreters general.

Genealogical claims bolstered petitions for positions in Spain's administration of its American territories. Legitimacy, *limpieza de sangre*, and noble ancestry factored into one's contention for office. Most studies of ancestry's influence on a candidate's case for employment have focused on Spanish-descent bureaucrats. This paper instead contrasts the divergent strategies translators of full or partial Maya descent used in terms of recognizing or obscuring their maternal ancestors.

Living with the Dead: Ancestral Houses as Monuments of Remembrance and Continuity

Mortuary space anchors the materiality of the living to the immateriality of the dead. Such spaces foster remembrance through the curation, transformation, or regeneration of skeletal remains to reinforce social rights, responsibilities, and meaning across generations. Following from the construction of the social house by Gillespie and Levi-Strauss, this paper explores how burial among the ancient Maya varied across space, time, and social identities. Mortuary spaces are complex where some remains became ancestors, others are separated or isolated for internment elsewhere, some are monuments to the territorial relationships, and others are physically or

socially marginalized. While physical houses may have mimicked meaningful cosmic and human forms, imbuing the space with souls and social memory, the corporeal remains allow us to explore the unworldly component of mortuary space. Whether occupied or not, these spaces hold social and/or political power and provide the framework to understand social relationships within ancient Maya spaces from a bioarchaeological analysis of human skeletal remains.

A Preclassic monumental sculpture from Holmul and current Maya beliefs on life and death

In this paper, I will describe a well-preserved monumental sculpture of the "Old God" from the ancient lowland maya city reflecting on its value as one of the clearest examples of continuity of ancient beliefs into the present. The sculpture, dating to 400 BCE, is so far the earliest securely dated example of the new medium of monumental sculpture in stone and stucco that would become the hallmark of ancient Maya monumental art from the Late Preclassic period onwards. Today, one of the most revered religious ritual figures among the contemporary highland Maya is that of Maximon, also known as Rilaj Mam, "great grandfather". The meaning and origin of this Maya "saint" are often contested. Today, this ancestral figure is sought after as a provider of abundance, wealth and success in many Guatemalan indigenous communities, as well as being a medicine god, and protector of childbirth. Perhaps the latter function is what is celebrated in the Holmul sculpture from 2400 years ago.

3322 Haunting presences and absences: Ghosts in contemporary institutional contexts - panel 1

Start Date: 11/21/2025 12:45 PM **through** 11/21/2025 2:15 PM

Venue: Sheraton **Room:** Napoleon BR A1 & A2 (3rd fl)

Type: Oral Presentation Session

Death does not always bring closure. In many cultural, clinical, and personal contexts, the dead linger as memories, as spirits, as unresolved trauma, or as institutional absences. Death can also awaken haunting recollections of past (traumatic) events or revive forgotten relationships. Hence, this panel explores the theme of Ghosts through the lens of medical anthropology, focusing on how individuals, families, communities, and healthcare systems engage with the spectres of death and dying.

Within Western medicine, ghosts, as well as other supernatural mysteries and unquantifiable experiences, have been largely displaced by objectivity and evidence-based frameworks. Yet despite this clinical omission, ghosts remain omnipresent (e.g., Langford 2013; Hume 2018). They manifest in the quiet hauntings of healthcare workers, the persistent presence of ancestors in patient narratives, the gaps left by institutional neglect, and the emotional and spiritual residue of suffering and dying. Medical practices may even be built on or around the very ghosts they were supposed to supersede (e.g., van der Geest 2005; Langford 2016).

Organized by the Death and Bereavement Special Interest Group of the Society for Medical Anthropology, this panel invites contributions that consider how death and dying are entangled with haunting absences and aching attendances and how the dead are remembered, embodied, erased, or summoned in medical, communal, and personal spaces.

The paper of this panel will examine literal and metaphorical ghosts across diverse settings, and that illuminate the ways in which presence persists, despite medicine's best attempts to render absence final. More specifically, this panel will address what does it mean to be haunted by a death poorly handled, or silenced, or by a grief that defies linear resolution? How do medical practitioners navigate the unseen yet palpable presence of the dead?

Presentation(s): Scared conventional: How ghosts in psychiatric continuing medical education might hinder care for the living

3. Psychiatric practitioners treat various, often nebulous mental health problems with a range of psychotropic drugs. In today's climate, physicians prescribing drugs such as SSRIs and Barbiturates, with media and political lives beyond the clinical sphere, face considerable scrutiny. Psychiatric physicians complete Continuing Medical Education (CME) programs each year toward improvement and maintenance of clinical performance (Ameen, 2016). In CME focused on malpractice in Psychiatry, stories of deceased patients, whose deaths are attributed to the failure of the physician, are described in detail as cautionary tales, encouraging physicians to be circumspect in their prescribing. Legal theorists and physicians have suggested that medicine practiced to avoid litigation, rather to improve the patient's health, can encourage "defensive medicine" that leads to unproductive and expensive care (Sage et al 2020). In this paper, I consider how the ghosts of deceased patients linger in medical education, summoned to inspire fear and discourage innovation among providers whose patients may already threaten self-harm on a regular basis. Based on participant observation, conversations with providers, and review of CME course data, I question how stories of death and suffering factor into psychiatric practice and care, and how these deceased patients might be better memorialized by confronting outdated and poorly supported fear-based curricula in medical education.

Silent disaster: How the ghost of Covid stalks England's hidden care landscape

'Responsibilised commoditisation' refers to the state leveraging family members' sense of responsibility as a cost-saving alternative to investing in public services. In the second decade of the 21st century, austerity policies in the UK led family, friends, and neighbours to transition from being informal sources of support to becoming the primary providers of social care in the community. This situation of structural violence intensified during the onset of Covid-19, as unpaid carers were effectively abandoned due to distancing rules that severed their remaining connections with professional care providers. I examine the legacy of moral injury that results from hermeneutical epistemic injustice, which occurs when someone's experiences are not well understood either by themselves or by others. I also explore the effects of the protective mechanism of active forgetting that arises from these experiences during the Covid-19 pandemic. I conclude with reflections on the ongoing, unacknowledged, and cumulative consequences for the country's future preparedness for emergencies.

Presenter(s): Andrea Lambell

An Enchanted Hauntology of Stigmatized Losses at a Green Burial Cemetery in Rural New England

Green burial cemeteries provide a portal into emerging currents in American cultural relationships to the dead. Life Forest, a conservation cemetery in rural New England, offers working-class bereaved families the ability to grow a tree from their loved one's cremated remains. Moving beyond the funeral ritual, this paper examines the long-term engagement people have with the cemetery.

The informants of this paper are bereaved mothers who have lost a child to suicide or drug overdose. Based on four months of ethnographic research at Life Forest, this paper presents an enchanted hauntology in which bereaved mothers forge relationships to their dead loved ones, as ghosts, through the ecology of the cemetery. These ghosts are transient, staging their presence in the changes of the ecology of the cemetery. This paper examines: Are the relationships forged with the dead at Life Forest bounded to the cemetery? How do these ghosts, which hide in the ecology of the cemetery, extend beyond the cemetery's limits and penetrate the everyday lives of bereaved family members?

Presenter(s): Sasha Kramer

Carrying Ghosts: Respiratory Therapists and the Hauntings of Ventilator Withdrawal

Withdrawing mechanical ventilation is often framed as a clinical procedure, yet for respiratory therapists (RTs), it can be an intimate and haunting experience. Positioned at the bedside, RTs witness final breaths, manage silences, and become stewards of a patient's last moments. This paper explores how RTs 'carry ghosts', the emotional, ethical, and spiritual residues of those they helped die. These hauntings linger in subtle ways: a familiar alarm tone, an empty ventilator, or a name on a discharge list. Drawing on interviews and reflective narratives, I examine how RTs navigate the dissonance between clinical detachment and profound emotional presence. The ghosts that follow are not always spectral, but live in memories, moral uncertainty, and institutional silences around grief. How do RTs reconcile repeated proximity to death with limited space for mourning? And how might we better acknowledge the invisible burdens they carry?

Presenter(s): Louise Chartrand

Ghosts of the Pandemic: Respiratory Therapists, COVID-19, and the Hauntings of Ventilator Withdrawal

During the COVID-19 pandemic, respiratory therapists (RTs) became frontline witnesses to mass death, repeatedly tasked with initiating, and ultimately withdrawing, mechanical ventilation. Working in isolation rooms under crisis protocols, many RTs describe carrying the ghosts of patients they never fully met: sedated, voiceless, and separated from family. This paper explores how pandemic conditions intensified emotional and moral hauntings for RTs. With rituals of dying disrupted and grief deferred, RTs were left to manage not just machines, but silence, sorrow, and spiritual ambiguity. Drawing on reflective accounts from Canadian RTs, I examine how the absence of closure created persistent, ghost-like presences that linger in memory and practice. These are not just personal hauntings, but structural ones, rooted in the erasure of care work, the moral injury of triage decisions, and the invisibility of RTs in broader public narratives. How might we name and hold space for these ghosts of the pandemic?

2895 Precarity and Possibility: Migrant Youth, Transnational Schooling, and the Politics of Belonging

Start Date: 11/21/2025 12:45 PM **through** 11/21/2025 2:15 PM

Venue: Sheraton **Room:** Napoleon BR A3 (3rd fl)

Type: Oral Presentation Session

Across the globe, young people are navigating futures constrained by war, economic precarity, environmental crisis, political instability, and systemic violence. The resulting forced migration and displacement have created conditions of protracted uncertainty, particularly for youth. While education is often framed as a stabilizing force and a pathway to opportunity, many migrant and displaced youth experience schools as sites where exclusions are reproduced and belonging is provisional.

This panel brings together ethnographic research from Africa, East Asia, the Middle East and the Americas to critically examine how young people make decisions about their educational futures amidst structural constraints. How might migrant and displaced youth create conditions of care and possibility? In what ways do they articulate and reimagine futures that seem increasingly unattainable? And how do people teach and learn under conditions of prolonged waiting, statelessness, or legal precarity?

Our papers, which explore the transnational dimensions of school curriculum, pedagogy, student-teacher collaboration, and educational decision-making, conceive of transnational schooling as educational experience shaped by cultural interconnectedness and mobility across nation-state lines. Drawing on conceptual frameworks including hauntology (Derrida 1994; Gordon 2008), border thinking (Mignolo & Tlostanova 2006), countertopography (Shirazi & Jaffe-Walter 2020), and relational safety (Bellino & Oliveira, under review), we center youth as active agents who strategize, imagine, and care for one another in the face of precarious futures. By foregrounding the everyday labor that young people undertake to navigate the shifting terrain of transnational schooling, this panel contributes to ongoing conversations in the anthropology of education, migration, and youth.

Presentation(s): Navigating Exclusion: The High School Experiences of Immigrant Youth in Rural Pennsylvania

From 2010 to 2022, the immigration population in Pennsylvania grew by 32% (Batalova, 2024). More specifically, as of 2021, Pennsylvania is one of 9 states across the United States that not only has a great number of immigrant children (59,000 children) but also a great number of recently arrived

immigrant children (21,000 children). Immigrant youth speak a variety of home languages, represent numerous cultures, have differing educational experiences and occupy a range of legal statuses (Suárez-Orozco et al., 2008; Zhou & Gonzales, 2019). These intersecting identities in addition to the current sociopolitical context of Pennsylvania work in tandem to differentially shape their K-16 educational pathways (Le et al., 2024; Kanno & Kangas, 2023). Drawing from participant observations and fieldnotes collected as part of a college-and-career workshop series with immigrant youth, this paper examines how immigrant youth and teachers alike worked together (or not) to subvert anti-immigrant policies shaping their educational experiences in Pennsylvania. Given the growing number of newcomer youth attending rural K-12 schools, this paper sheds light on the need for educators to engage in both individual and collective action in order to better help immigrant youth navigate and overcome structural barriers, stemming from anti-immigrant policies, which impede their social advancement.

Presenter(s): Sophia Ángeles

Learning in transit: Waiting to learn, learning to wait

Recent U.S. immigration policy changes have contributed to longer waiting periods for migrant families in Mexican border cities, and the recent cancellation of CBP One has made waiting indefinite. Under conditions of "prolonged transit," how do migrant young people and their caregivers make decisions about children's formal educational pursuits? And what do they learn about themselves, national borders, and their countries of origin, transit, and destination/ asylum in the process? This study centers on four Honduran families enrolled in the MPP program living in Monterrey and as they entered the US (2020-2022, during and following Trump's first presidency), and two families in Tijuana (2024-2025, approaching and during Trump's second term). Experiences of prolonged displacement induced by the violence of national borders negatively impact young people's sense of self, future, and belonging. Yet this study highlights how migrant youth learned about and enacted their agency in relation to im/migration decisions, danger, and discrimination to create "relational safety" for themselves and their families (Bellino & Oliveira, under review). Building on Dyrness and Sepúlveda's concept of "border thinking," young people both waited to learn—i.e., opted out of pursuing formal schooling opportunities, and learned to wait—largely through fraught interactions with im/migration officials, prolonged periods in-transit, and evolving understandings of legality.

Presenter(s): Michelle Bellino

The Analytical Potential of Hauntology to Examine Learning in Crisis

Abstract: Hauntology is a conceptual neologism introduced by French-Algerian philosopher James Derrida in his 1993 analysis of Marx and the specter of communism. Also referred to as spectral studies, or the spectral turn, hauntology has been widely taken up by the field of anthropology to explore societies that are haunted by histories of colonialism, violence, and historical trauma, as well as the haunting presence of global inequalities and reactionary efforts to silence the past. Similarly, Weinstock (2004) conceptualizes the ghost as a symptom of repressed knowledge that

calls into question the possibilities of a future based on avoidance and silencing of the past, while Lorek-Jezińska & Więckowska (2017) maintain that ghosts should be reckoned with because they conceptualize and foster processes of understanding exclusion, oppression, and conceiving of and reclaiming otherness. Using this conceptual grounding, I aim to explore the usefulness of hauntology in analyzing the educational experiences of Burundian refugees in Tanzania. Given this community's historical experiences of colonialism, cyclical violence, displacement, and more recent forms of humanitarian governance, hauntology may provide a useful tool in exploring not only documented processes of knowledge and cultural erasure through humanitarian educational interventions, but also the remnants of knowledge and culture that linger, haunt, and shape the onto-epistemological futures of this community.

Presenter(s): Kelsey A. Dalrymple

Educational aspiration and precarity in the shadow of Korean unification

For South Koreans increasingly removed from the memory of war, unification with North Korea is an unrealistic pipe dream. But for migrant youth, unification takes on an everyday symbolic presence whose specter determines their current access to rights and their future economic stability. Drawing on ethnographic fieldwork in and around faith-based resettlement schools in South Korea, this study examines how North Korean displaced youth confront the irony of a state that simultaneously champions them as bastions of national unification while denying them social services. This paper traces how South Korea's Ministry of Unification partners with churches and religious NGOs to form a diffuse apparatus of care and control, shaping the educational and moral lives of displaced youth. At the same time, it considers how youth respond to and repurpose the symbolic weight of unification: sometimes to secure sponsorship, sometimes to assert belonging, and sometimes to complicate the terms of their inclusion. Through these everyday acts, youth conjure the specter of unification to improve their local conditions and complicate expectations for their social integration.

"They Are Our Children": Exploring Faith-Based Schools as Sites of Educational Opportunity for Refugee Youth

Turning the lens away from national schooling, which has long been proven problematic for refugee populations, this comparative case study explores the educational opportunities that faith-based, tuition-free schools provide refugee youth living in protracted exile in low and middle-income neighboring countries. Leveraging Shirazi and Jaffe-Walter's (2020) concept of countertopography and Bartlett and Vavrus's (2017) comparative case study, this article draws on two years of ethnographic engagement at "Cairo Christian Academy", a Sudanese refugee school in Egypt, and qualitative interviews with teachers, administrators, and staff at "Beirut Covenant School" in Lebanon to answer the following question: What is possible within private, faith-based, tuition-free schools—particularly schools that teach secular curricula and are open to children from all faith backgrounds, as these mirror some of the more egalitarian aspects of public education—which

have absorbed refugee students as a part of their mission to care for others? Findings suggest that the funding structures, hiring practices, and moral underpinnings of these schools facilitate caring, loving environments for refugee youth while also providing educational opportunities unavailable to them otherwise in these host countries. Furthermore, the study's methodological approach explores ways to conduct research in contexts mired in multiple, overlapping crises.

5477 Gustafsson's Ghosts: Honoring the Career and Legacy of Mai Lan Gustafsson's Research and Teaching on Spirit Posses

Start Date: 11/21/2025 12:45 PM **through** 11/21/2025 2:15 PM

Venue: Sheraton **Room:** Napoleon BR B1 (3rd fl)

Type: Roundtable/Town Hall

Mai Lan Gustafsson was an anthropological scholar, writer, and educator whose profound impact continues to reverberate through diverse corridors of the discipline. Gustafsson, who passed away in 2018, chaired Christopher Newport University's Department of Sociology, Social Work, and Anthropology and, during her thirteen-year career there, authored the pathbreaking ethnography *War and Shadows: The Haunting of Vietnam* (Cornell University Press, 2009), and published numerous articles and thought pieces. In this Roundtable, a group of distinguished anthropologists who worked closely with Gustafsson and/or were influenced by her profound influence reflect on the impact and legacy of her research, teaching, and outreach. In centering the dignity and worldviews of the Vietnamese people whom she worked among-people tormented by angry and unappeased ghosts-Gustafsson's scholarship on spirit possession was bold and provocative. Her rich storytelling and refusal to reduce their traumas and afflictions to Western theoretical constructs, have, today, become standards of quality ethnographic practice. Always an educator, Gustafsson's innovative teaching shaped generations of undergraduate students, as well as colleagues who were fortunate enough to work alongside her. In addition, her work with refugee resettlement, her media appearances and film consultations, and her ironic (clandestine) role as "The Optimist" for the Syracuse Herald American newspaper exemplify the deep and complex engagements with the public that anthropology continues to strive towards. Dr. Gustafsson's research, her ethnographic innovations, her distinguished teaching career, and her multifaceted outreach cast a long and overlooked shadow across the field of contemporary anthropology. This roundtable brings together anthropologists working in academic and applied spaces across Religious Studies, Asian Studies, Migration and Refugee Studies, Linguistic Anthropology, Experimental Ethnography, the Anthropology of Education, and Health Services Research all of whom recognize the ghosts of Gustafsson's work, by embracing the thin line between those who have passed and those who remain living and honoring her remarkable career and legacy.

3418 Inherited Ghosts: Memory, Lore, and Haunting Landscapes of Post-Colonial Americas

Start Date: 11/21/2025 12:45 PM **through** 11/21/2025 2:15 PM

Venue: Sheraton **Room:** Napoleon BR B2 (3rd fl)

Type: Roundtable/Town Hall

Ghosts are remnants and connections to the past, often associated with specific stories, legends, or historical incidents. Whether one believes in ghosts or not, there is no denying the universal existence of these supernatural/spiritual beings, often tied to specific places, such as haunted houses, isolated canyons, or other points on the landscape. Typically, ghosts are linked to deaths, tragic incidents, accidents, or battles, but can also present themselves as guiding omens or warnings for the future. In these ways, ghosts and their associated spaces, legends, and lore can act as anchoring points to local descendant communities living among and around these spaces today. This panel brings together archaeologists, cultural anthropologists and Indigenous anthropologists working in the Andean highlands, Central Mexico, and the Southwest United States [three regional areas that were similarly colonized by the Spaniards] to discuss these themes of placemaking through the supernatural, spiritual, and sometimes haunted spaces. By bringing together this diverse group of scholars, we also seek to build connection and community by discussing how confronting the colonial ghosts of our discipline and the lessons we learn from the ghosts of our ancestors, help us engage with the ghosts of the communities with which we work.

2594 Ghostlier Demarcations, Keener Sounds: Language Ideological Assemblages and the Unseen Forces of Linguistic Life

Start Date: 11/21/2025 12:45 PM **through** 11/21/2025 2:15 PM

Venue: Sheraton **Room:** Napoleon BR B3 (3rd fl)

Type: Oral Presentation Session

Languages, as employed by their speakers, are forces that order, shape, and haunt the world in often invisible ways. Like breath on glass, their presence is felt lingering and fading all at once. In Wallace Stevens' *The Idea of Order at Key West*, a woman sings beyond the genius of the sea-not reflecting it but remaking it, giving voice to what would otherwise remain unheard. She does not impose meaning onto the world but, through the act of singing, makes it audible, sensible, and real. The poem ends with the line, "In ghostlier demarcations, keener sounds." Similarly, Language Ideological Assemblages (LIA) (Kroskrity 2018; 2021) function as ghostly demarcations-not always tangible, yet deeply structuring how language is heard, understood, and lived.

This panel interrogates how language ideologies are not merely rationalized beliefs but affective, phenomenological, and embodied forces. Linguistic anthropologists have long recognized that ideologies emerge from lived experience, political economies, and durable histories of power and resistance (Silverstein 1979; Gal 1979; Woolard 1985; Irvine 1989; Woolard 1998; Kroskrity 1998; 2004). They are the maker's rage to order words of the sea-not reflections of reality but reconfigurations of meaning, identity, and belonging. Indigenous epistemologies have long privileged aurality, sensation, and the unseen in meaning-making (Kroskrity and Field 2009; Ferguson 2019; Dennison 2024; Barrett 2024). Language is not only what is spoken but what is heard, felt, and that which lingers in silence. Ferguson (2019) reminds us that for many Sakha speakers, language is ontologically alive: with spirit, agency, and consequence. To speak is to act.

Panelists examine ideologically and ontologically informed discourse practices across diverse terrains. LIAs provide a layered canvas of historical depth and sociocultural scale that illuminate processes of becoming amid projects of endurance, maintenance, and survival, complicated by generational disjunctures (Meek 2012). Ferguson analyzes the songs and practices of Sakha punk and metal artists whose creativity is both constrained by and pushes back against dominant language ideological assemblages, echoing beyond performance and energizing emergent language planning. Kroskrity examines how the Village of Tewa community maintained a hopeful, agentive stance in the threatening contexts of pandemic, climate crisis, economic destabilization, and heritage language contraction. Barreras explores the role of Yo'eme within multilingual repertoires shaped by LIA in transborder contexts. Dzikowski explores LIA in transnational Japanese contexts, showing how linguistic self-representation is haunted by historical and political orders. Zheng analyzes digital discourse among Chinese women as an ideological battleground reconfiguring state and cultural narratives. Sinski addresses how educational migration indexes ideological hierarchies of linguistic value.

Presentation(s): GHOSTLIER DEMARCATIONS OF HOPEFUL

FUTURES: KEENER SOUNDS FROM THE TEWA LANGUAGE IDEOLOGICAL

ASSEMBLAGE.

Multiple threats to the language, economy, health, culture, and the very existence of the 700 members of the Village of Tewa (Kroskrity 1993) have jeopardized the future of this small but historically persistent, diasporic Pueblo community. Their distinctive language, rhematized (Gal & Irvine 2019) to their community identity and maintained for 325 years is now spoken by comparatively few youth. This paper explores the Tewa language ideological assemblage and the various resources and constraints that shape the community's hopeful process of becoming (Kroskrity 2018). Exploring both Tewa language ideologies and ontologies (Ferguson 2019,) I explore the audacity of Tewa "generative hope" (Tuck 2009)--a hope that is more than a passive wishful thinking but rather a hopeful 'reorientation of knowledge and action' (Miyazaki 2004) that recontextualizes traditional linguistic practices and language ideologies (Kroskrity 1998). Special attention is devoted to linguistic resources, including grammar, for constructing an agentively hopeful orientation to the "not yet" of an uncertain future and to the verbal art of social dance songs which have become a site of both cultural reflection and intergenerational transmission. The Village of Tewa Language ideological assemblage thus provides the ecological environment in which expressions of Tewa hope become, taking on audible and visible material form.

Presenter(s): Paul Kroskrity

Ghostlier Demarcations of the Sonoran Borderlands: Language, Memory, and Yo'eme Sovereignty

This paper draws on ethnographic research in the transborder Sonoran Southwest to examine Yo'eme multilingualism through the lens of Language Ideological Assemblages (Kroskrity 2018, 2021). Rather than viewing shifts between Yo'eme, Spanish, and English as translanguaging, I argue they are structured by ceremonial obligation, kinship ties, and spiritual accountability. Using Lingual Life Histories (Kroskrity 1993), I trace how multilingual practices are shaped by ideological forces that act across generations what we refer to as ghostlier demarcations. These are not metaphorical but material: memory, prayer, and place guide language use in context-specific ways (Ferguson 2019; Debenport 2015). Drawing on examples from ceremonial speech (Yo'e Noki) and everyday narration (Yo'e / hiiak eteho), I show how speakers use their full multilingual repertoire to maintain cultural and epistemological sovereignty. In a region marked by surveillance and fragmentation, multilingualism persists as a calibrated system of alignment tinkering speakers to community, territory, and ancestral presence. These patterned shifts do not indicate linguistic loss,

but reflect a recursive semiotic logic that reasserts relational knowledge and transgenerational continuity. Thus, the Yo'eme Language is not just a tool of communication, but a moral force that binds the past to the present and future.

Presenter(s): Cesar Barreras

Japanese American Princess: A Language Ideological Approach to Transnational Identity, Incarceration, and Pageantry within the Nikkei Community

As a population that was forced to undergo mass incarceration and assimilation, Japanese American communities provide insight into our understandings of heritage language loss, linguistic forms of social differentiation, and surrounding political economies. Haunted by collective memory – and by the ghosts of historical injustice – Japanese American language ideological assemblages offer a glimpse into the racialized, gendered nature of language as it used to both challenge and reinforce existing social divisions. Utilizing ethnographic data, interviews, and archival research conducted within a Japanese American pageant program in Southern California, I seek to examine racial, gendered, and generational divides within and surrounding the Japanese American community at large. As a participant myself – in a pageant program that seeks to foster the Japanese American community's next generation of cultural ambassadors – I aim to illustrate the linguistic and sociopolitical contexts surrounding transnational migration, racialized incarceration, and cultural performance as a means of either resisting or perpetuating ethnic assimilation.

Presenter(s): Aiko Dzikowski

Assembling Fear: Ideological Configurations in Young Chinese Women's "Fear of Marriage" Discourse

In recent years, online discussions centering on the "fear of marriage" (恐婚) have gained popularity in China's digital space, with young single women as the primary participants. Drawing on 12 months of digital ethnography and 17 in-depth interviews, this paper unpacks the complex ideological assemblages underpinning a seemingly anti-marriage discourse. I argue that rather than expressing outright rejection, women assemble their fear by negotiating among conflicting ideological forces: state pronatalist imperatives, familial expectations, and transitional feminism. First, they resist the tightening reproductive governance that treats marriage as a key site for promoting fertility, yet remain entangled in dominant imaginaries that link marriage with childbirth. Second, they reject intergenerational sacrificial motherhood while still longing for intimacy shaped by normative family ties. Third, while feminist critiques provide tools to deconstruct marriage as a trap, these critiques are haunted by affective contradictions on romantic love. In this case, fear becomes a condensed expression of ideological conflict and an affective assemblage that binds together tension and ambivalence, while also opening space for reconfiguring dominant meanings on marriage and womanhood. This paper contributes to the anthropology of language ideologies by extending the framework of ideological assemblages into the realm of digital affective discourse.

Presenter(s): haiyi zheng

Geopolitical Rupture and Ideological Assemblage: Acts of Linguistic Bricolage amongst Transnational Chinese Students in the United States

This paper explores the discursive practices of transnational Chinese students in the United States during the early 2020s through the conceptual lens of language ideological assemblages. Building upon earlier scholarly discussions of transnational Chinese subjectivity (Ong and Nonini, 1997; Ong, 1999; Fong, 2011) and global assemblages (Ong and Collier, 2003) in the early 2000s, this article locates transnational Chinese students as existing between two rival nations during a new era of profound geopolitical rupture. Here, these students strategically appropriate and deploy Chinese-language and English-language phraseology in various contexts to navigate the politics of American higher education, while simultaneously forging and expressing their respective individual and group-based identities. The author focuses on three case studies: one transnational Chinese student's deployment of *zou xingshi* (go through the motions) at a mandatory anti-bias training seminar, another's description of political protest as *luan* (chaos), and one's narration of a #MeToo incident at their college in order to illustrate how through subtle shifts in register, stance, and affect, multilingual actors assemble the ideological forces of nationalism, neoliberal individualism and political precarity and how these ideological forces echo through language, performance and silence.

5257 Speculative Histories and Cultures: Entanglements of Spirits, Ghosts, the Dead, and Nonhuman Life Forms

Start Date: 11/21/2025 12:45 PM **through** 11/21/2025 2:15 PM

Venue: Sheraton **Room:** Napoleon BR C1 (3rd fl)

Type: Oral Presentation Session

This panel draws on ethnographic accounts from Africa, East Asia, and the US to explore entanglements between spirits, ghosts, the dead, and nonhuman agents in the historical and cultural development of modernization, state expansion, natural resource extraction, and capital accumulation. These ethnographies reveal the how and why of entanglements, the conditions of their emergence and how they manifest. Across these papers, the panelists examine the interactions between various social categories such as migrants, Indigenous peoples, laborers, tech entrepreneurs, and fish farmers and illuminate processes of disappearance, reunion, negotiation, strategy-making, and self-making with spirits and nonhuman forms. Lee and Cheng's focus on the telling of ghost stories and human communion with animal spirits enriches anthropological approaches to multispecies interactions and thinking with waterworlds and ancestral lands. By articulating these seemingly unusual yet normal relationships with "the others," the panelists' interlocutors find their ways to become resilient despite the unequal power relationships in capitalism and globalization. Stahl's contribution examines relationships between humans and the new "species" of artificial intelligence, showing how they constitute not just new

agents, but new kinds of speculative human expertise. Several papers situate relations of power in unfinished histories of race, empire, and migration which some of their interlocutors seek to write on their own terms. Through the reemergence of unmarked graves and cemeteries, Huang and Sheridan trace "ghostly presences" and engage in forms of analysis that "admit the ghost—that special instance of the merging of the visible and the invisible, the dead and the living, the past and the present—into the making of worldly relations and into the making of our accounts of the world" (Gordon 2008 [1997]).

Presentation(s): Negotiating with Ghosts and Deities in Waterworld: Fish Farmers' Ritual Parade in Southwest Taiwan

This article examines the sociocultural importance of an annual fish-farmer-organized ritual parade to a fishing village located in southwest Taiwan. Based on six times of participant observation of the annual parade and the related religious events in Simu fishing village, I scrutinize ritual parade as a form of purposeful walking that not only pacifies ghosts that may be harmful to villagers for religious purification, but also negotiates with deities and ghosts to provide good care of fish farmers and aquatic animals. I adopt the idea of waterworld (Hastrup & Hastrup 2017) to discuss the rituals taking place on the road and in a sacred water channel where the burning of joss paper, lifting and carrying a grand sedan chair, the villagers crawling under the sedan chair occur. Negotiations take place between human beings, deities, and ghosts to make disturbed daily lives back to social order and also bless commercialized domesticated aquatic animals to stay safe and grow well. I analyze the ritual practice in the waterworld within the context of aquaculture development in southwest Taiwan where the negotiation has been continued among human beings, deities, ghosts, and even animals for over two hundred years. Facing the recent changes of aquaculture as a vibrant sector under the influence of global trade, energy crisis, natural resource depletion, and aging population, fish farmers in this region would be both haunted and blessed to keep their fishing and religious practices.

Hunting with Wandering Ghosts and Protective Animal Spirits? Negotiating Extraordinary Experiences for Indigenous Rights in Taiwan

This paper explores how Indigenous Amis people use extraordinary experiences—such as ghost stories and encounters with animal spirits—to negotiate with the state over their rights to hunt and fish on ancestral lands. Since the end of World War II, the suburban coastal areas of eastern Taiwan have been designated first as military outposts and later as industrial sites for capitalist production,

restricting Amis access to traditional practices like bird hunting and coastal fishing. The struggle for hunting rights in these coastal areas is complicated by two issues: first, a cultural belief that these areas are dangerous and haunted by wandering ghosts; and second, legal restrictions aimed at protecting endangered bird species that breed in coastal and estuarine zones. Drawing on local myths and hunting strategies, this paper argues that multispecies ethnography offers a framework to recognize the agency of nonhuman beings, while ghost stories provide a source of resilience for Indigenous peoples in resisting both state authority and conservationist discourses. Ultimately, this paper proposes a contested path toward integrating nonhuman and spiritual entities into anthropological thought. Ghosts and spirits, like animals, are good to think with.

Subterranean Traces: Unearthing Death and Disposability in the Ruins of the Mine

Drawing on ethnography, interviews, and archives, this essay charts intertwined histories of Black migrant labor, Chinese indenture, resource extraction, and race-making in the ruins of South Africa's gold mines. Connecting past to present, it examines the zama zama, informal migrant miners who work in abandoned mines, and the unmarked graves of Chinese mineworkers to understand how histories of extractive capitalism and racialized disposability reemerge, illustrating the enduring force of not only these histories but also their entanglements. It utilizes a subterranean archive of disappearing figures and buried traces and theorize the afterlife of death.

Presenter(s): Mingwei Huang

Becoming Swahili: Chinese Traces, Cosmopolitan Spirits, and Scenes of Historical Speculation in Tanzania

In 2013, a Chinese migrant in Tanzania dreamt of a cemetery, leading her to a Sinhalese Buddhist monk who had discovered an abandoned Chinese burial ground in a large Muslim cemetery in Dar es Salaam. The site held 25 graves of early 20th-century Chinese migrants from Kaiping County, largely forgotten except by a few older Tanzanians in Kariakoo—a district now dominated by post-1990s Chinese traders. This neglected site contrasted sharply with the well-known and maintained Chinese Experts Cemetery, where 51 workers who helped build the Tanzania-Zambia railway are buried. The monk claimed the spirits of the dead had asked to be remembered, prompting the migrant to raise funds in the Chinese community to restore the site and trace descendants. This paper explores how the restoration and search for descendants sparked different historical narratives about Tanzania-China relations. While Chinese media emphasized ancestral reunion, Tanzanian intellectuals I interviewed framed the graves within a cosmopolitan Indian Ocean past, including the Chinese into Swahili kinship genealogies. I situate this alongside a Tanzanian martial artist who believes East Asian martial arts originated in the Muslim world, and has been taught by Arabic, German, Korean, and Chinese jinn. These entangled stories offer alternative, spiritual, and speculative genealogies that challenge the boundaries of "Africa" and "China," and illustrate how (other)worldly traces and agents shape new histories.

Speculating Intelligence: AI, Expertise, and Self-Making in Taipei's Tech Economy

In recent years, a speculative market bubble has emerged around artificial intelligence, which is increasingly evoked as a nonhuman species bringing to the surface a preoccupation with unseen powers and the notion of a 'ghost in the machine.' Based on 19 months of fieldwork in Taipei, Taiwan, this paper shows that AI and the economic subversions it will allegedly cause have profound effects on self-making practices. In the AI industry, models of the future economy are made visible through imaginative practices, including marketing, branding, and hype. To demonstrate this, the process of subject formation in artificial intelligence work is analyzed within modalities of speculation, characteristic of startup founders, and organizations to show how imagined AI enriched futures leverage their expertise while simultaneously re-inscribing the epistemic authority of their work. Contributing to studies of expertise that seek to understand "how particular knowledges become credible and actionable" and how this knowledge "attains, force and presence in the world" (Harvey and Knox 2015, p. 13), the chapter uses the analytic of expertise to explore the profound reflections of AI professionals as they encounter what AI tools continue to teach them about intelligence. The paper draws upon science and technology studies, and social studies of finance, adding an examination of the interior lives of experts to studies of expertise and financial markets in anthropological scholarship.

7188 Dead Souls: Temporality and Narrative in the Production of Multiple Selves

Start Date: 11/21/2025 12:45 PM **through** 11/21/2025 2:15 PM

Venue: Sheraton **Room:** Napoleon BR C3 (3rd fl)

Type: Oral Presentation Session

Linear temporalities and curated narratives produce constant ghosts in their omissions. From the cover letter of a failed application to the photos that remained in drafts, a version of the self dies little deaths of possibility when there is only one path for it to develop. But what is a shape without negative space to delineate it? The ghosts of selves that never materialized coexist with those that did. Ghosts, after all, occupy more than one realm at a time. Their ability to turn boundaries porous yields an expansive landscape.

This panel understands "ghosts" as an impulse to cross boundaries and approach the material, the theoretical, and the social as a matrix. The six presentations in this panel address this topic at the intersections of anthropology and queer theory, Native/Indigenous studies, media studies, Black studies, and science and technology studies. This panel thinks through technological mediations of death(s), the preternatural as a feature of the banal, multiplicitous selves, and the seemingly contradictory—which ghosts are particularly apt at navigating.

Presentation(s): Beyond Presence: Social Media Deletion and Self-Presentation

This contribution explores the ways that individuals produce narratives of the self through information removal on social media sites. There is robust, cross-disciplinary scholarship from communication and media studies, sociology, anthropology, and science and technology studies, showing the diverse ways that people present and produce the self through social media sites. Often drawing on Goffman's dramaturgical approach to interpersonal interaction, the overarching focus of these analyses is the way that the self is constructed through informational presence. That is, individuals use platform architectures to produce photos, comments, messages, and hashtags, that help present a mediated self to distant networks. Left implicit, however, are the ways that informational absences equally act as means of everyday self-presentation. In interviews and ethnographic accounts of social media self-presentation, scholars often reveal acts of information deletion but do not analyze how these acts also modulate identity and present the self, for instance, removing dead names when undergoing gender transition, deleting photos of exes after a breakup, or "cleaning" feeds to be more palatable for potential employers. This analysis surfaces these existing, implicit accounts of information removal to examine how absence works to narrate the self, and to argue for a more serious consideration of deletion as an everyday means of self-presentation.

Presenter(s): Frances Corry

Temporal Selves: Supernatural Affordances in Digital Temporalities

Time apparently works a little differently in fairyland. We do not enter digitally networked time as ourselves but materialize linear selves more suited to the time flows of networks and differently mediated temporalities. One cannot usually enter the worlds of ghosts and return unchanged, and the same is true for digital temporalities.

In otherworldly spaces, time flows are disconnected from "real" time and are produced and maintained spatially. Time through and among networks is understood as operating in contrast: complex, linear, and real—but following the approaches of the unseen, digitally-mediated time-spaces conflate abstract flows with stabilized nodes, posturing as reflections of reality. A queered approach to temporality may remediate the toxic chronomancy (time manipulation) of network time and intentionally fracture the self to access artistic, disconnected, generative, affective, useless, or personal temporal realms. Discussions of the chronotope and double-voicing support this approach. An analysis of digital media guided by anthropologists studying the supernatural can splinter time and self, creating possibilities of queered temporal experiences for ourselves and our selves in flawed digital spaces. One can create performances of time manipulation and proxy-self creation within and somehow away from networks. A more fantastic, ghostly understanding of the

mechanisms of network time is needed to trace the selves that can shift away from imposing linearities.

Presenter(s): Camille Coy

All The Selves I Never Was

Cover letters are an odd genre. They are full of promise and vulnerability. The sender becomes involved in a nonreciprocal epistolary relationship of sorts. Like sending a message in a bottle, the exercise often involves an unknown recipient and some degree of hope or perhaps naiveté. Unlike sending a message in a bottle, for the sender, many times their livelihood depends on it. Sometimes dreams. Often both, and some more. Each rejection resulting from another "failed" application is the small death of a specific dream, a specific self. Sometimes the rejection is more like being ghosted, never hearing back. It goes unresolved. My many idealized selves have died many little deaths. As it stands, professional and academic rejections leave multiple ghosts in their wake but seem to lack processes for mourning those selves that never were. For one, professional trajectories are often narrativized as linear endeavors—straight paths to success. As if the rejections along the way were not also how anyone is anywhere. What are the spaces, then, for mourning the ghosts of idealized selves constructed in applications? How can we mourn them? Or is it best to evade death altogether by evading the linear narrative and opening up to multiple coexisting selves? What are the delineations? Perhaps we ought to transverse them like ghosts who, having no concern for space and time, become boundary agnostic.

Presenter(s): Areli Rocha

"Whatever Killed Mary Lone Bear is Killing Us"

How many selves will media technology demand of us in our struggles to exist? Can these selves be recovered and put to rest? If so, how?

After the release of Call of Duty: Modern Warfare 3 (2023), I found myself feeling burnt out, compulsively playing MW3's multiplayer mode which came with multiplayer maps from the original MW2 (2009). Inspired by the nostalgia of playing these maps, I followed a whim and bought used copies of a few older COD games. This led to an uncanny encounter with my 2012-self in the form of saved COD gameplay, a self I had forgotten about and whom I came to recognize as the precursor of my burnout. I wanted to put this old self to rest and to do this I made a short video "Waiting to Respawn," deanimating my ghost by splicing together my character's moments of waiting. I uploaded it to YouTube.

As I, historical researcher, barrel through, Katamari-like, the archives of America's playful, horrific, and occasionally joyous, past, the number of my selves archived in digital media is incomparable to the number of voices demanding justice I roll over and collect. The story of Mary Lone Bear, the daughter of two Lakota Buffalo Bill Wild West Show performers who died mysteriously after being photographed by Gertrude Käsebier haunts me the most.

Presenter(s): Anthony Brave

Encounters in the Terrain of the Self: Possession and Restorative Practice

The body possessed is typically imagined as one suffering from an intruding entity, an interloper or unwelcome guest of the natural subject in their own house. This paper will explore the relations between possession, surplus, and pluralism by considering how having an extra body in one's possession reveals the unsettling side of luxurious excess. This talk explores these ideas through two, contrasting cases of possession from recent film: the first is Jordan Peele's 2017 film *Get Out* and the second is Mati Diop's 2019 film *Atlantique*, where each one provides an unusual or unique view of possession. Peele's film presents a vision of the possessed in distinctly material terms, dealing in the visual language of body horror to consider possession in terms of neurological control via hypnosis, with clear resonances to the condition of slavery in which the Black body is taken as a luxury object to extend the life and wealth of a White master. Diop's *Atlantique* offers a vision of haunting and possession as a restorative practice, in which certain debts, both romantic and economic, are repaid and fulfilled through encounters that take place within the terrain of the self. In both cases, the possessed body functions as an excess or surplus body that extends the power of the possessor in time or ability. Drawing on ideas from Denise Ferreira da Silva, Georges Bataille, and Christina Sharpe, this paper explores possession at the intersections of Anthropology and Media studies.

Presenter(s): David Bering-Porter

Between Suspension and Release: Reflections on Ghostly Practice and Haunting as a “Something-To-Be-Done”

This presentation offers a critical reflection on Ghostly Practice, a constellation of ritual movement techniques I have developed and facilitated over the last decade for creative mourning and conspiring with memory, spirit, and the more-than-human in performance. Informed by extensive training in Japanese butoh, physical theatre, and ritual dramaturgy, and drawing inspiration from symbolist, spiritualist, and expressionist theatre traditions, these techniques approach performance as a liminal mode of consciousness than can be phenomenologically apprehended as a haunted encounter. Through Ghostly Practice, participants seek not merely to be haunted, but to do with and through haunting. Following Avery Gordon's claim that "haunting... is distinctive for producing a something-to-be-done," I consider haunting as a dramaturgical force and Ghostly Practice as a case study in how performance may transform our relationships to ghosts, time, the body, death, and the unseen. A key focus is on Ghostly Practice as a haunted and haunting modality for sensing, sending, and bending time, reflecting on movement-based ritual techniques that produce conditions for experiences of parallel presence, temporal rupture, present-death, and living (with) death or otherwise (other)lives, haunted futurities, animist perception, ancestral lines, gates/portals/veils and mirror worlds.

2540 The Sensory City: Feeling and Futurity in Urban Southeast Asia

Start Date: 11/21/2025 12:45 PM through 11/21/2025 2:15 PM

Venue: Sheraton **Room:** Napoleon BR D1 (3rd fl)

Type: Oral Presentation Session

What will the city of tomorrow be like? And what will it feel like to be there? In Southeast Asia today, developments like Nusantara in Indonesia, Silicon Island in Malaysia, and Gardens by the Bay in Singapore are competing to provide vivid sensory models of the possible future: "smart," "sustainable," even "more-than-human" cities (Wang 2024) designed by renowned international architects and built in rainforests, on reclaimed coastlines, and on islands made of imported sand (Munn 2021). Others, such as Sihanoukville in Cambodia and Forest City in Malaysia, have garnered global attention for their purported emptiness as "ghost cities" of extreme proportions (Avery and Moser 2023, Moser 2018). These projects, often controversial and unfinished, promise innovations they are hard-pressed to deliver and draw as much attention for their failures as their anticipated futures. Underpopulated, under construction, or ungrounded, they exemplify a certain popular imaginary of possibility while existing in the present as an affective reminder of what could or should have been (Luvaas and Chio 2025).

Nevertheless, these are very real places one can visit, live in, and work in. This panel critically examines the sensory landscapes of these new urban developments in Southeast Asia and the material and political infrastructures that generate and sustain them. Chio explores the work of two artists, Ai Weiwei and Sim Chi Yin, alongside architectural renderings, to expose a key tension that underlies many developments in Asia today. She argues that the glossy urban futures promised by these projects depend upon a design imaginary of a bucolic, rural past and a rural present that must be erased through the process of building. Koh discusses the green sensibility promoted by Singapore through projects like Gardens by the Bay, a showpiece of living architecture that draws tourists to a shifting sandscape of sinkholes and decomposing trees. The spectacle of sustainability, she demonstrates, literally covers over a legacy of environmental destruction. Schwenkel draws from "soundwork" conducted in formally planned, unplanned, and "deplanned" urban environments in Vietnam, Cambodia, and Myanmar to argue that soundscapes serve as a sensory archive of urban transformation, a sonic, rather than visual, blueprint of what a city has been and may become. Luvaas, finally, offers a photo-ethnographic documentation of what it's like to be on the ground in future Southeast Asian cities right now. Through evocative and intimate portraits of Forest City and Nusantara as they are inhabited today, he shows how the future lingers as a felt presence in the lived moment. In each paper, the future emerges as a lived, somatic-sensory experience, constructed out of, but not defined or limited by, the built environment. It is a felt reality, rather than just an imagined temporality.

Presentation(s): A Pastoral Present for the Urban Future: Land Reclamation, Domestic Architecture, and the Design of an Ideal City in Asia

This paper explores designs of the "ideal city" in Asia through works by two artists: photographer Sim Chi Yin's ongoing project "Shifting Sands" and Ai Weiwei's 2012 film "Ordos 100." Shifting Sands is a multi-year photographic exploration of the transnational market for sand needed for land reclamation and urban infrastructure construction. Ordos 100 documents a project curated by Herzog & de Meuron and Ai Weiwei in 2008 in which 100 architects were asked to design 100 domestic residences (with no intention to construct) for the new city of Ordos, China. By situating these artists' works alongside ethnographic observations of Southeast Asian eco-cities now in development, I explore how the idea of the "ideal city" in Asia is rooted in the enfolding of a pastoral present within the seemingly inevitable urban future. To solve the problems of climate change and urban decay, such projects aggressively promote "ecological" and "smart" features to a rising Asian middle class with the financial and cultural capital to invest in sustainable affluence. In fantastically photorealistic architectural renderings that combine a futuristic aesthetics of glass and concrete high-rises with lush tropical waterfront landscapes, the near-future of urban Asia exists within a bucolic, verdant present. The temporality of such aesthetics reveals a curious contradiction where an imagined rural past, from which elements of the pastoral are extracted, becomes fundamental to the ideal city in Asia.

Presenter(s): Jenny Chio

Unsettling Hegemonic Grounds: Subsurface Politics in Singapore

Singapore's 'greenness' and reputation as a 'garden city' have become an economic boon and a 'national symbol of identity and pride' (Goh 2014: 245). Yet critics have argued the nature of the city-state's environmentalism is an overly aestheticized, surface-level one that fails to disrupt the logics of colonialism and capitalism (Myers 2015). Paying attention to this tension, this paper considers how the meanings of nature and ecological sustainability are entangled with state-making. Based on ethnographic fieldwork conducted at Singapore's 101-hectare nature-park, Gardens by the Bay, that was entirely 'reclaimed' from the sea, I move beyond surface politics of aesthetics to the subsurface of reclaimed land to consider what kinds of textures and material properties make certain kinds of grounds difficult to govern. This paper shows how terraforming takes us deeper than an expected story of speedy capitalism to a more complex and considered genealogy of slow settlement. I consider what must be done to the ground to make it territory (controlled by a sovereign) or environment (known by a certain kind of discipline). By casting the ground as my figure of analysis, I ruminate on what makes the ground in Singapore difficult to frame or organize in these ways.

Presenter(s): Vanessa Koh

Sonic Blueprints on the Future: Rethinking the Planned City through Sound

This paper rethinks the master-planned city through its soundscapes, asking what urban sounds—and their absence—reveal about the aspirations and afterlives of urban planning. By shifting from visual to acoustic analysis, I examine how sonic environments reflect the outcomes and challenges of centralized planning regimes. Drawing on "soundwork" in cities in Vietnam, Cambodia, and Myanmar, I use sound to illuminate three interconnected planning iterations: formal planning, unplanning (design interventions), and deplanning (disassembly of planned spaces). These processes involve the rejection or alteration of rigid planning systems, resulting in unplanned growth and fragmentation of built space. The sonic dimensions of these cities—manifested in the echoes of abandoned construction, the cacophony of ad hoc renovations, or the eerie silence of unpopulated districts—underscore the entanglements of power, adaptation, and abandonment. These sonic phenomena index shifts in urban imaginaries and disruptions to planning logics tied to political and economic changes. Rather than view planned cities as deprived of sensory intensity, I argue that sound provides a rich archive of urban transformation—one that captures the tension between design intentions and their dissolution in practice. What emerges is not a critique of planning's "radical indeterminacy," but a rethinking of how people sense and imagine urban futures—through sonic rather than visual blueprints.

Presenter(s): Christina Schwenkel

The Future as an Architecture of Now: Living Today in Tomorrow's Southeast Asian Cities

Forest City, Malaysia promotes itself as a "prime model of future city," a smart, sustainable mega-development of 700,000 people built across four reclaimed islands in the Johor Strait. The pandemic, however, precipitated a slowdown in sales. Today, there is only one island and a population of around 7,000 residents. There are no sidewalks and buildings already show cracks at their base. Nusantara, meanwhile, is the future capital of Indonesia, another "eco-city" that promises to radically re-envision what it means for humans to live with nature. A changing presidential administration and a dearth of foreign investors have made its fate also uncertain. Yet Nusantara, like Forest City, already has residents, including hundreds of workers, vendors, and municipal administrators tasked with making the city inhabitable for others.

This presentation draws from photo-ethnographic fieldwork in Forest City and Nusantara in 2024-2025 to evoke what it's like to live in a city stuck in development limbo. Through vivid, intimate, and often ghostly imagery of two cities that may, or may not, become models of sustainability, it argues that the future is very much present in residents' daily lives, shaping the sensory experience of moving through and occupying urban spaces. The future is not just temporal, but spatial, a perceptual filter that impacts how residents encounter the cities around them and create meaning out of the inchoate now.

Presenter(s): Brent Luvaas

4647 "Spirit Biographies: Ghosts of Capitalism's Past"

Start Date: 11/21/2025 12:45 PM **through** 11/21/2025 2:15 PM

Venue: Sheraton **Room:** Napoleon BR D2 (3rd fl)

Type: Oral Presentation Session

The papers in this panel explore the biographies of spirits associated with the rise of capitalism throughout the Atlantic world. These include the afterlives of Haitian spirit-objects collected during the U.S. Occupation of Haiti, now held at the Smithsonian Institution; deities enshrined in Ghana's historic slave forts and castles that manifest their former European "governors"; "jumbie" spirits associated with gold extraction in the Guyanese-Venezuelan borderlands; and the mystical surgery of a Brazilian healer who channels the spirit of Dr. Fritz, a German immigrant. What do these spirit biographies tell us about the fetishized forms of human commodification associated with Atlantic slavery? What repressed histories of capitalism do they ritually restore? How do these spirits navigate pathways of mobility and immobility associated with forced and free migration, resource extraction and accumulation, as well as alienation and healing throughout emergent spheres of production and circulation? By inverting conventional understandings of material relations and their fetishized forms, we resurrect the ghosts of capitalism's past within the core of racial capitalism.

Presentation(s): "Sorcery and Eschatology in Haitian Heritage Collections"

In this paper I highlight historical collections from Haiti at two Smithsonian institutions, to explore the ways bòkò (magicians/sorcerers) distributed their corporeal power using animate portable objects and then consider the implications of those objects lying dormant in museums. Unlike the sacred ritual materials of Haitian Vodou, which were animated with the divine forces of the lwa, these sorcery objects were enlivened by human persons no longer living. In the wake of discussions surrounding a federal "African American Graves Protection and Repatriation" (AAGPRA) policy, I bring together Haiti's diverse eschatological traditions to propose an examination of sorcery objects that attends to their surviving human-spirited presences.

Presenter(s): Pascale Boucicaut

"So Many Dungeons": Specters of Racial Capitalism in Ghana's Slave Forts and Castles"

The slave forts and castles that punctuate Ghana's historic Gold Coast stand as monumental reminders of the rise and fall of Atlantic slavery. Built as "factories" for bulking enslaved Africans for sale and transshipment to the Americas, they served as highly regulated sites of Afro-European exchange and interaction when royal monopolies entered the so-called "African Trade." Building on Saidiya Hartman's spectral explications of the "so many dungeons" which gave birth to modern racial capitalism, I problematize the "European" deities and spirit-worlds that cluster within and around these historic sites of human commodification and figure prominently in annual Fante

festivals. How did the fetishism of human commodities join forces with local deities and enter enshrined pathways of ritual exchange? How do the annual purification ceremonies of these coastal communities launder the accumulated "dirt" of their historic profits? And most importantly, how do these ghosts of atrocities past illuminate the mystified origins of racial capitalism? Data from Cape Coast Castle (Cape Coast), Fort William (Anamabo), and Fort James (Accra) provide telling clues.

Presenter(s): Andrew Apter

"Gold is a Jumbie: Natural Resource Extraction in the Guyanese-Venezuelan Borderlands"

This paper investigates gold as part of the spirit landscape in the borderlands of Guyana, Venezuela, and Brazil. During my fieldwork in 2019, an ex-miner, who for many years worked the goldfields of Northwest Guyana, made a point of telling me that "gold is a jumbie." He went on to clarify that gold spirits lived deep within the earth and needed to be summoned with appropriate offerings—women's bodies, alcohol, and blood. His reflections provided an important way of conceptualizing the ethics of natural resource extraction and its spiritual politics. Although he used the term "jumbie" in the coastlander Creole tradition, where jumbie generically signified a dangerous and/or malevolent spirit, the fact that the term was applied to gold also signaled the broader Indigenous conceptualizations of the spirit world and the long history of Afro-Indigenous epistemological entanglement in the Guianas. Indeed, his comment revealed the durability of precolonial and an early-colonial Amazonian and Caribbean worlds of otherworldly beings and ritual objects known as cemís or zemís, which often were or inhabited specific natural objects like stones, timber, etc. In telling a regional history of gold mining in these borderlands, this paper centers gold as one of many natural resource specters that, like oil, loom over social and political relations in borderlands and facilitates the operations of global capitalism.

Presenter(s): Vikram Tamboli

"Zé Arigó: Mysticism and Modernity in 1960s Brazil"

Zé Arigó (alias José Pedro de Freitas) was an Espiritista faith healer with a third-grade education who rose to fame during the regime of Juscelino Kubitschek (1956-61), a period of high modernist faith in scientific progress and development in Brazil. Arigó became renowned for his psychic surgeries for which he earned the nickname the "surgeon of the rusty knife" for his apparent ability to excise tumors with scalpels and his gaze from prestigious clients. Much work on popular religion in Brazil has focused on how popular healing protocols channel notions of Blackness derived from slavery. This paper considers Arigo's relationship to Dr. Adolf Fritz, the spirit of a German immigrant who served as Arigo's spiritual guide, while seeking to locate Arigó's popularity within post-war Brazilian high modernism which came to a crescendo during Kubitschek's term in office. As he rose to celebrity status, Arigó attracted the ire of Catholic priests and others who sought to refute his miracle cures and who saw his healing practices as dangerous, leading to his conviction of practicing medicine without a license in 1956. This essay draws upon extensive journalistic interviews and popular writing about Arigó collected for a documentary on him in the 1970s.

2790 Living Right: Far-Right Youth Activists in Contemporary Europe

Start Date: 11/21/2025 12:45 PM **through** 11/21/2025 2:15 PM

Venue: Sheraton **Room:** Napoleon BR D3 (3rd fl)

Type: Roundtable/Town Hall

In conversation with Agnieszka Pasiaka's newly released *Living Right* (Princeton University Press, 2024), this roundtable will explore why youth are increasingly participating in far-right social movements in Europe and beyond. In popular narratives of the rise of the far-right, people often treat illiberalism as a deviation from the norm, attributing it to critiques of neoliberalism, and as a sudden disruption. Yet, as Pasiaka argues, liberalism is not just an economic project but also a political, ethical, and cultural one, and critiques of liberalism have been rising for decades. Her ethnographic research with youth in Italy, Poland, and Hungary reveals how far-right social movements in Europe offer their participants friendship, community, and personal transformation in the context of profound sociopolitical transformations that date back to at least the 1980s. Drawing on *Living Right*, we will discuss: What is radical nationalism's appeal? What circumstances give rise to the success of the far-right? What is the relationship between the transnational and national in far-right imaginaries and actions, and what are various individuals' attitudes to the past? And finally, how does studying the far-right challenge and deepen anthropological methods and practice, offering important lessons for our current moment?

6943 Haunted Landscapes: Ghosts, Memory, and Justice in the Anthropocene.

Start Date: 11/21/2025 12:45 PM **through** 11/21/2025 2:15 PM

Venue: Sheraton **Room:** Nottoway (4th fl)

Type: Oral Presentation Session

Ghosts unsettle the relations between past, present, and future by activating a "spatio-temporality in which past and future participate simultaneously and in unpredictable ways" (McCormack 2010:642). They call us to "responsibility" and "justice" (Derrida 1994:5), evoking processes of remembering, stimulating memories, contextualizing presences, provoking imagination, and inspiring action (McCorristine and Adams 2020:106). In recent years, ghosts have emerged as significant actors in research on how landscapes are imagined and reconstructed. Studies have

explored ghost towns like Bodie in California (DeLyser 2001), memory and memorialization in urban industrial ruins (Edensor 2005), and endangered or extinct species in biodiversity conservation (McCorristine and Adams 2020). DeLyser (2001) argues that empty places or absences play particular roles in reconstructing the past and shaping visitors' imaginations. Edensor (2005) examines how encounters with industrial ruins as ghostly affordances can interrogate and contest normative ways of social remembering. Recent environmental work focuses on the "haunted landscapes of the Anthropocene," including more-than-human histories, traces left by extinct beings, remnants of industrial modernity such as tires, human-made radiocesium, abandoned trees marked by human disturbance (Gan et al. 2017), and rivers that no longer flow (Toso et al. 2020). Drawing from these perspectives, we ask: What kinds of possibilities for justice emerge when we are engaged in "arts of noticing" and encounter with ghosts that "speak for" erased/silenced histories, languages, knowledges? How do the presence of ghosts in landscapes of contestation open opportunities for communities to resist being forgotten, reclaim their sense of belonging, and reshape their futures? What kinds of ethnographic possibilities do researchers' encounters create?

Presentation(s): Time, care, and cultivation in the more-than-human production of protected spaces.

Landscapes encountered today are the assemblages of past practices and relations by humans both alive and ancestors, plants and animals, and elements of fire, water, and wind. This presentation examines the more-than-human production of spaces in two of my research sites: forests in Quichua speaking Runa territories along the Bobonaza river in the Ecuadorian Amazon, and highland balds in southwestern Virginia, United States. I analyze cultivation and care-taking practices that humans engage in to produce such landscapes in addition to the role of nonhumans and elements to bring to the fore the politics, ethics, and questions of justice. Along the Bobonaza, Runa become yacharishka (familiar) with the land by cultivating relations with nonhuman beings. Sarayaku Runa telegraph these relations to the world via the Sisa Ñambi, a network of gardens along the perimeter of their territory, and through Kawsak Sacha, their 'proposal for life' as an alternative to conventional development. In the highlands in Virginia, I analyze the contested politics and roles of various stakeholders, both human and nonhuman, in crafting the vision and future of highland bald protected areas.

Ghosts of the Castorcene: Spectral Care in Forests of Ruination and Organized Disappearance

In Argentine Tierra del Fuego, "forest cemeteries" cleared by North American beavers are described by ecologists as one of the most dramatic ecological transformations since the Holocene—an assessment that raises haunting questions about an Anthropocene not led by the Anthropos. But these landscapes are haunted in less visible ways too: by ghosts of state terror, settler colonialism, and extractivist modernization. Drawing on long-term ethnographic work with biologists, trappers, and Indigenous peoples involved in beaver eradication efforts, this paper explores how forests, animals, and even traps carry unsettling traces of violence and loss. Following Gordon's (2008) notion of ghosts as social figures who bring more-than-one story at a time, I discuss how haunting emerges not only through memory, but through affective and material disturbances: the smell of boiled beavers in labs, the ruins of felled *Nothofagus* forests, and the spectral presence of injured beavers whose fear of humans stems from intergenerational trauma inherited from ancestors in the Northern Hemisphere. These haunted terrains unsettle temporal, geographic, and taxonomic boundaries—between human and animal, past and present, here and elsewhere—and call us to learn to listen, and care for, a plurality of voices that animate ghostly landscapes.

Presenter(s): Mara Dicenta

Ghosts in the Fiddle: Music, Memory, and Spirits on an Eroding Landscape

At the ruins of a 10th century monastery in the Mongolian Gobi desert, the spirits of long dead monks perform operas on a nearly-desiccated former wetland that locals take as reminders of the violence of Stalin's Great Purge. Not far off, a musician performs a two-stringed fiddle with a horse's head carved into the pegbox to rid a house of "the chill," a kind of shamanic-spirit-turned-New-Age-vibe that brings jealousy and bitterness into the household on the wind that comes off the river. Even this horse-headed fiddle itself is said to be *sünstei* – bearing a soul – but the meaning of "soul" has become complicated in the wake of a near century of Soviet-style, state-enforced atheism and the mass disenchantment of the neoliberal shock treatment that followed. As desertification creeps north past the Gobi monasteries and permafrost melts away from the northern taiga, the erosion of the Mongolian landscape releases historical violences – material and supernatural alike. This paper takes cases in which people in Mongolia use music to make sense of landscapes where the ghosts of people and animals intermingle with the scars of colonialism, neoliberalism, and climate change. In each case, traditional fiddlers conceptualize the affective power of music as a powerful tool for more-than-human communication and commemoration that exceeds the category of the human.

Birding in Ruins

Once a symbol of technological progress, one of Colombia's most prominent shrimp farms now lies abandoned. Since its closure in the mid-1990s, over 600 hectares of engineered ponds have

become remnants of capitalist dreams of progress and development. Located along a key bird migratory corridor on Colombia's southern Pacific coast, these ruins now host abundant life, mainly migratory waterbirds fleeing Northern winters. In this presentation, I examine these abandoned water infrastructures as a haunted landscape, where the residues of past ecological interventions give rise to emergent life forms that, in turn, catalyze alternative futures. Drawing on ethnographic fieldwork with birders, I explore how sensorial practices like careful listening and close observation of the seemingly mundane lives of migratory and resident birds produce "evidentiary ecologies" (Lyons 2018). These modes of engagement with the ghosts of past aquaculture experiments not only document endangered bird life; they also reanimate a landscape otherwise marked by decaying machinery and unruly microbial life. I argue that such practices operate as modest forms of hope (Kirksey and Chao 2022) and gesture toward more than human futures grounded in interspecies alliances. In a region where the promises of Colombia's 2016 peace agreement remain unfulfilled, birding in the ruins of past capitalist projects emerges as both a form of witnessing and a modest practice of envisioning more just multispecies futures.

Unruly Objects and the Reconciliation of Past and Present at Mordecai Historic Park

At Mordecai Historic Park in Raleigh, North Carolina, a routine excavation into a 19th-century chimney foundation unexpectedly revealed Indigenous artifacts—projectile points and stone flakes—alongside materials tied to the Mordecai family, their servants, and enslaved people. These unexpected finds disrupted dominant narratives and temporal boundaries, acting as spectral presences that demanded recognition. Often dismissed as "background noise" in historical archaeology, such materials at Mordecai became ghostly agents of disruption and connection, prompting a reorientation of interpretation and community engagement. This paper explores how these traces challenged disciplinary norms and led to collaboration with the Tuscarora Nation of North Carolina, a group seeking official recognition of their ancestral ties to and claims on the land. The Mordecai case shows how archaeological encounters with unexpected artifacts—especially in urban heritage contexts—can catalyze remembrance, recognition, and resistance. By engaging with the spectral qualities of the material record, archaeologists may reimagine ethical responsibilities and create space for long-silenced voices. When descendants reconnect with place, unruly ghosts can emerge as venerated ancestors.

8987 A War of Position: Defending Academic Freedom and Social Justice

Start Date: 11/21/2025 12:45 PM **through** 11/21/2025 2:15 PM

Venue: Sheraton **Room:** Oakley (4th fl)

Type: Late-Breaking Roundtable/Town Hall

Around the world, scholars are actively engaged in a war of position as academic freedom and the application of scholarly knowledge in pursuit of social justice are increasingly coming under attack.

This April, India prevented Prof. Apoorvanand Jha from traveling abroad to speak on the "university under a global authoritarian turn." In May, Trump attempted to bar Harvard from enrolling international students, and US scholars across the country have had their federal research grants suspended as political censorship grows. This July, Hong Kong universities were forced to accept Beijing's "guidance" agreements, deepening a climate of fear and self-censorship. These events echo broader global patterns: Hungary has ended accreditation for gender studies programs and exiled the Central European University; Argentina has gutted public university funding and curtailed institutional autonomy; and China has imposed ideological controls restricting research and disappeared Uyghur scholars. Egypt too is detaining human rights researchers under anti-terrorism laws, Uganda is arresting scholars for dissenting work on women, gender, and sexuality, and Palestinian academics are facing full-on scholasticide.

These assaults cut to the very heart of the anthropological endeavor to open space for a multiplicity of dissenting viewpoints in pursuit of more just and liveable worlds. In response, this Town Hall draws upon Gramsci's conceptualization of a "war of position" as a protracted, strategic struggle for radical social transformation. Whereas the "war of maneuver" is a direct, frontal assault on the state -- a revolution in the classic sense -- power is not only held by the state; it is also deeply embedded in civil society -- in schools, media, family structures, religious institutions, pop culture. These are the spaces where consent is manufactured, where hegemonic ideologies are naturalized, and where people come to accept the existing social order as common sense. The war of position is a slow, subtle struggle that involves building alternative institutions, shaping public discourse, contesting dominant narratives, and gradually undermining the cultural and ideological foundations of hegemony. In other words, it's a struggle to reshape common sense: to transform the terrain on which power operates.

As anthropologists, this concept is particularly powerful because it pushes us to examine how domination is maintained not only through coercion, but through consent -- and how that consent can be challenged and reconfigured from within. Although we are often adept at studying these processes, many of us feel less equipped at skillfully engaging in them ourselves. But, as recent events make clear, we must. Participants will share their experiences, struggles, and strategies fighting this war. We will think together about how to effectively reach and persuade others -- from the classroom to the newsroom -- in defense of academic freedom and social justice.

8110 The Politics of Lingering Part Two: How Indigenous lives and practices persist in colonial contexts that disrupt or disregard them

Start Date: 11/21/2025 12:45 PM **through** 11/21/2025 2:15 PM

Venue: Sheraton **Room:** Rhythms I (2nd fl)

Type: Oral Presentation Session

What happens when Indigenous practices, ontologies, and modes of relationality outlast the conditions that are meant to destroy them? This panel explores the politics of lingering-how Indigenous people, traditions, and more-than-human relations persist, adapt, and insist on life in colonial contexts designed to erase or assimilate them. We bring together eight ethnographic engagements that illustrate the nuanced ways Indigenous practices persist in altered forms, often in spaces where they are marginalized, commodified, or actively undermined. In contexts shaped by displacement, diaspora, and settler colonial violence, lingering is not merely a passive survival; it is an active, relational process. The first part of the panel explores how Indigenous ways of knowing and being help to create and manage relationships with human and nonhuman entities, including the environments and landscapes in which they live. Drawing on research from Ecuador, Peru, and the West and Southwest United States, these papers present a case for the importance of Indigenous epistemologies and ontologies that go beyond the scope of what is considered possible by Western settler societies. The second part of the panel focuses on how various Indigenous communities are navigating their relationships with the world and other beings in the face of colonial intervention. This session centers Indigenous perspective in their interactions with colonial states and governments in an attempt to move past narratives that see Indigenous experiences as reactionary. Ethnographic data for these papers come from Ecuador and the Western and Southern United States. Together, these papers ask how Indigenous worlds linger-sometimes quietly, sometimes defiantly-in spaces that are often apathetic or even hostile to them. We take seriously the labors of making and remaking relationships and of navigating institutions that often refuse to see Indigenous life on its own terms. Lingering, in these contexts, is not a failure to disappear; it is a politics of endurance, of presence, and of world-making.

Presentation(s): "If Only the Truth was Told": The Invisibility and Persistence of the Timpanogos

The Timpanogos Nation, whose people have long lived on the land now called Utah, continue to live with the consequences of settler violence that has not ended but merely shifted form. After being forced onto the Uintah Reservation and administratively absorbed into the Ute Nation—a polity to which they do not claim belonging and which does not claim them—the Timpanogos remain federally unrecognized, structurally excluded, and existentially threatened. An extermination order

issued against them in 1850 has never been officially rescinded; its presence lingers, shaping how Timpanogos people relate to the state, to the land, and to their own safety in the place they have always called home. This paper draws on ethnographic fieldwork, oral history, and documented historical research to explore how Timpanogos individuals and leaders navigate the persistent violence of erasure and misrecognition. I focus on the everyday expressions of mundane millenarianism—not a concern for the future, but a daily reckoning with the slow dissolution of their people and the possibility of reconstitution. Oral history emerges here not just as a form of memory but as a mode of political action, a tool for reclaiming legitimacy, kinship, and continuity in the face of ongoing displacement. The Timpanogos persist—not outside colonial time, but within and against it—lingering in a world that is trying very hard to disregard them.

Living Well Does Not Mean Living Better: Reimagining Entrepreneurship Education in Rural Ecuador

In rural Ecuador, Indigenous youth often face limited access to quality education, frequently needing to leave their communities to continue schooling beyond the seventh grade. In response, outside actors, including U.S. based nonprofits, have partnered with local communities to create alternative educational spaces. This paper examines the tensions and interactions between these actors and their competing aspirations. It focuses on Saminay El Legado, a U.S. funded and Indigenous led rural secondary school that combines culturally grounded curricula with externally developed entrepreneurship education. Whether this model disrupts or reinforces dominant ways of knowing is a central question of the research. Specifically, it explores how U.S. driven entrepreneurship education, rooted in capitalist ideals of individualism, competition, and wealth accumulation, contrasts with Indigenous *saberes*, or ways of knowing, which emphasize community well-being, reciprocity, and collaboration. This research highlights the lived economic, political, and social realities that resist capitalist development models and asks how entrepreneurship education might be reimagined to align with Indigenous worldviews.

Stomp Dance and Solidarity: Muscogee (Creek) Ritual Practice Amidst Colonial Land Disputes

This paper examines the Muscogee (Creek) Nation's Stomp Dance as a living tradition that both anchors Indigenous world-making and galvanizes collective resistance amid ongoing colonial land disputes. The Stomp Dance, central to Muscogee spiritual and communal life and closely tied to the Green Corn Ceremony, endures through intergenerational transmission, adaptive ceremonial practice, and intertribal collaboration. In 2025, Muscogee citizens returned to their ancestral territory in Georgia to perform the Stomp Dance at Atlanta's South River Forest, a site threatened by urban development, marking their first ceremonial presence there since forced removal in the 1820s. This act of ceremonial reclamation, supported by alliances with Cherokee, Seminole, and Shawnee communities, demonstrates how Indigenous rituals persist and adapt, sustaining communal bonds and cosmological connections even in spaces rendered hostile by settler institutions. The Muscogee's engagement with public ritual, legal advocacy, and coalition-building

illustrates a politics of endurance that transcends narratives of Indigenous disappearance or mere reaction to colonial power. Contemporary threats, such as the proposed "Cop City" project on Muscogee burial grounds, echo historical patterns of dispossession, yet also catalyze new forms of solidarity with environmental and racial justice movements. Rather than fading into the margins, Muscogee ceremonial life lingers defiantly, asserting pre

Stories of Pocatello: Reflection on the Ethical Engaged Research with the Shoshone-Bannock Tribe

Reflecting on the inconsistency in the structure of scientific knowledge throughout the history of modern Western science (Thomas Kuhn, 1962) makes space for many existing systems of knowledge unrecognized in the scientific establishment. In mainstream anthropological inquiry, extracting data from a population and analyzing it for knowledge production involves establishing a relationship with the community largely defined by power dynamics. In the context of Native American societies, such a mode of inquiry gets challenged and contested. Indigenous method (IM) of inquiry developed from a worldview contrasted with settler colonial anthropology (Pidgeon, M., & Riley, T. 2021). The I-CREWS project—a collaboration between Idaho institutions and the Shoshone-Bannock Tribe—exemplifies this shift while exploring energy-water systems through ethical engagement. This work pivots around the 6Rs Framework (Respect, Relationality, Responsibility, Represent, Relevance, Reciprocity) recognizing tribal and data sovereignty that ensures community control over research processes. This paper intends to reflect on the workshops (February-April 2025) on Re(Connecting) with the 6Rs hosted by the Idaho State University which is part of a workshop series (2022-2027) to reveal the novel ways of knowing and being based on the stories of Fort Hill reservation and Pocatello, home of Shoshone-Bannock tribe.

3673 China's growing care crisis: Emerging critical anthropological approaches

Start Date: 11/21/2025 12:45 PM **through** 11/21/2025 2:15 PM

Venue: Sheraton **Room:** Rhythms II (2nd fl)

Type: Oral Presentation Session

Many parts of the world are experiencing a growing care crisis at a time of larger demographic transformations such as population aging. East Asian countries like China are at the heart of these developments but remain poorly studied.

This panel brings together emerging critical anthropological research on China's growing care crisis to make a non-Western-centric intervention in on-going feminist debates on the current global care crisis. Feminist political theorists like Nancy Fraser (2016, 2021) have argued that the current global care crisis is a particularly acute manifestation of a social-reproductive contradiction inherent in capitalism, namely its structural devaluation of reproductive labor and its assumption that

reproductive capacities are infinite and readily available at a cheap price. This assumption means that reproductive capacities are often stretched to the breaking point. Indeed, the history of capitalism can be described as a succession of breaking points with varying degrees of intensity. Previous forms of capitalism have produced temporary solutions to these crises, but did not resolve the key issue of the structural devaluation of care work. The current world order of neoliberal digital capitalism has only intensified this devaluation, leading to an unprecedented care crisis that cannot be solved by "quick-fixes".

In this panel, we engage with Nancy Fraser and other feminist scholars to call for more critical research on the global care crisis but we are critical of monolithic approaches too centered on Western perspectives and trajectories. Inspired by recent critical anthropological scholarship in Asian studies, we call for a Chinese and East Asian de-centering of ongoing feminist debates on the global care crisis. In this panel, we invite papers proposing critical ethnographic approaches to everyday manifestations of China's growing care crisis: from childbirth care to child care, from elderly care to end-of-life care. Focusing on China's care crisis from a critical perspective is also a good way to develop new insights on what is happening in other parts of the world and what must be done to overcome or at least to attenuate the effects of the current crisis.

Presentation(s): Circulating Elders: Beyond Dichotomies of “Left Behind Children” and Senior Caregivers in Rural Meixian

A standard model of contemporary Chinese family life held by both insiders and outside observers usually describes an arrangement of left behind children and elders in rural areas, with a middle generation that seeks employment in urban areas. Recent fieldwork in rural Meixian, a Hakka area in rural Guangdong Province, reveals a more varied and fluid family situation. In Moonshadow Pond, the pseudonymous name of a Hakka village in rural Meixian, several models of family care emerge. Elders may migrate to cities to care for grandchildren but may also return to live in their village homes when those grandchildren start high school and are more self-sufficient. Middle-aged adults in mega cities such as Guangzhou and Shenzhen, may leave their more remunerative employment in such places and return to live in the village or county capital so that they can more closely parent their "left behind" children in their teenage years. Adults in their fifties and sixties meanwhile may face pressure as they simultaneously care for their parents and their own grandchildren. Meanwhile, many village elders continue even as great-grandparents to enjoy a communal life in the village. This paper attempts to understand these patterns not as static, or as

binaries such as caregivers and receivers, but rather as revealing the adoption of cultural models of family obligation and local identifications to an economy of wage work, migration and globalization.

Lost in the Connected World: Getting Old in Digital Urban China

Digital technologies are often considered to be challenging for older people. A country that is experiencing rapid ageing, China is pushing for the development of digital technologies and digital economy. Digital platforms have often become the essential infrastructure for the handling of all aspects of lives particularly in the urban areas. A growing body of scholarship has critically examined how digital platforms have reshaped everyday life experience. Yet, with attention to labor relations in the platform economy, such studies usually focus on the young and active users; older people are often invisible in these dialogues. This paper zooms in older people as smartphone users and explores their experience of vulnerability and dependency in the city of Guangzhou through the lens of care as a sociotechnical system. Older people became platform users often because the younger family members introduced them to platforms such as WeChat for familial socialization. Many had no options but to become platform users due to government requirements during Covid-19 pandemic. While some older people enjoyed digital convenience, many often felt isolated and helpless in a world where so many things have to be done online, and where family members would only focus on their smartphones in everyday lives and important festive moments. This paper sheds light on the care crisis by critically reflecting on what may be called "digital fix" in elderly care.

Making Meaning and Making Do Among Older Adult Spousal Caregivers in Shanghai, China

Based on long-term ethnographic fieldwork in China, this talk uses interpretivist and practice theory frameworks to explore the ways in which older adult spouses in Shanghai found meaning in taking care of an ailing husband or wife and how they made do with limited resources. Despite a traditional cultural focus on filial care by adult children, spouses are one of the top types of family members providing eldercare in China. With one of the oldest urban populations in China, Shanghai is a prime site for examining spousal eldercare. Taking place over six years, this study involved periodic interviews and participant observation conducted among thirty older adult spousal caregivers who were aging in place in two lower middle-income neighborhoods. These older adults were all primary caregivers for their spouse. Rather than fixating on the insufficiency of filial piety, most spousal caregivers focused on themes such as the importance of spousal reciprocity, pride in their caregiving abilities, and the superiority of spousal care. They also described and demonstrated their creative agency in making do with limited money and materials to provide good care for their spouse. Ingenious practices described with pride ranged from setting up mirrors so a spouse could lie flat and watch television on the ceiling to using plastic soda bottles for post-stroke physical therapy.

Presenter(s): Jeanne Shea

Between Care and Deception: Navigating Self-Care in China's Senior Supplements Market

This paper explores China's growing care crisis through the lens of senior urbanites' participation in the health supplements market. As eldercare shifts from state and family provision to market-based and individualized models, seniors challenge stereotypes of dependency by actively planning their later lives through self-directed care. Yet the very sites they turn to—local health supplements stores and promotional spaces—are widely regarded by the public as fraudulent or exploitative.

Drawing on eighteen months of ethnographic fieldwork, I examine how older adults turn to commercial wellness spaces to reconstitute care, sociality, and bodily maintenance. Senior customers purchase not only products, but also emotional recognition and everyday attention from peers and salespeople. Far from being passive victims, many seniors frame their participation as self-reliant and relationally meaningful. Yet this market-based care remains entangled with profit motives, regulatory ambiguity, and moral scrutiny.

By tracing these tensions, I argue that commodified care in China is both deceptive and meaningful—a moral and affective form that cannot be easily captured by Western feminist critiques of care's devaluation under capitalism. Ethnographic attention to these contested sites opens up new ways of understanding how seniors in China are responding to, and reshaping, the global care crisis from within their own historical and social conditions.

8601 Spectral Encounters in the Dark: Multimodal Interventions in Anthropology and Humanism

Start Date: 11/21/2025 1:30 PM **through** 11/21/2025 7:00 PM

Venue: Marriott **Room:** Jackson

Type: Installations

Spectral Encounters: Multimodal Interventions in *Anthropology and Humanism* invites participants at AAA 2025 in New Orleans into an open, resonant space where anthropology flickers at its edges—where image, sound, performance, and text meet in unfinished dialogue. This multimodal installation, hosted by *Anthropology and Humanism* is not a static display but a living intervention: a hinge, a gathering point, a site where multimodality is not only exhibited but questioned, stretched, and reimagined. What does it mean to make and review anthropology otherwise? How do our aesthetic, material and technological choices haunt the politics of knowledge production? This is a spectral space for wrestling with these questions creatively, for amplifying the experimental currents within the Society for Humanistic Anthropology and the Creative Anthropologies Network. Visitors are invited to move among projections, sounds, posters, and printed fragments—ethnographic poetry, postcards, and more—and to gather around a communal table for dialogue and reflection. *Spectral Encounters* is both installation and activation, an invitation to linger, listen, and imagine anthropology otherwise.

8742 Meet the Authors: 2025 Delmos Jones and Jagna Sharff Memorial Book Prize

Start Date: 11/21/2025 1:45 PM **through** 11/21/2025 2:45 PM

Venue: Marriott **Room:** Studio 5

Type: Special Event

Come celebrate the winners and honorable mentions of the Society for the Anthropology of North America's 2025 Delmos Jones and Jagna Sharff Memorial Book Prize! SANA awards this year's prize to Established Scholar Laurence Ralph for *Sito: An American Teenager and the City that Failed Him* (Grand Central Publishing, 2024) and to Emerging Scholar Dayna Fast for *The Best Place: Addiction, Intervention, and Living and Dying Young* (Rutgers U. Press, 2024). Honorable Mentions go to Carrie Lane in the Established Scholar category for *More Than Pretty Boxes: How the Rise of Professional Organizing Shows Us the Way We Work Isn't Working* (U. Chicago Press, 2024) and to two authors in the Emerging Scholar category: Orisanmi Burton for *Tip of the Spear: Black Radicalism, Prison Repression, and the Long Attica Revolt* (U. California Press, 2023) and Barbara Sostaita for *Sanctuary Everywhere: The Fugitive Sacred in the Sonoran Desert* (Duke U. Press, 2024). Learn about the prize committee's selection process for this biannual prize, which considered books published in 2023 and 2024. Join us in celebrating the nominees, hear this year's winners speak about their books, and bring your copy to have it signed by the author!

2840 Capitalism and Coloniality in the Thailand/Israel Migration Circuit

Start Date: 11/21/2025 2:30 PM **through** 11/21/2025 4:00 PM

Venue: Marriott **Room:** Bacchus

Type: Roundtable/Town Hall

The death of farmworkers from Thailand in the violence enveloping Palestine/Israel raises urgent questions about the transnational aspects of Israel's settler-colonial project and of Palestinian resistance. It also highlights the close interplay between the capitalist exploitation of underpaid, disenfranchised migrant labor and the maintenance of colonial social boundaries in Israel, Thailand and elsewhere. Combining historical and ethnographic methods, Matan Kaminer's new book *Capitalist Colonial: Thai Migrant Workers in Israeli Agriculture* (Stanford, 2024) argues that the importation of unfree labor from Isaan (northeast Thailand) to Israeli border regions cannot be understood apart from the colonial projects of both Thai and Israeli elites, which found common ground as allies of the Western imperial project of the Cold War. According to Kaminer, the replacement of Israel's Palestinian agricultural workforce with an Isaanite one solved problems of "surplus population" for both regimes, placing migrants in the line of fire as "colonizers by proxy."

This roundtable brings together anthropologists working in the Middle East and Southeast Asia to discuss the themes of capitalist coloniality raised by the book. While links between these two world regions are both longstanding and currently ramifying, they are rarely discussed together. The case of Thai migrants in Israel invites a debate on possible homologues and connections between regime

practice and subaltern resistance in the two regions. This debate, in turn, holds the promise of connecting ethnographic inquiry and anthropological analysis to urgent questions of international (especially South-South) solidarity in the face of genocide and rampant dispossession.

Presentation(s): Beyond Ontopoetics: Untangling Ontological Poetics-making in Ecofeminist Art Practices

Amid political advocacy for decolonization, feminism, and ecological justice, recent artistic and curatorial practices have increasingly intersected with anthropological knowledge, reflexively engaging with ghosts burdened by past violence and exploring the possibilities of activism in alternative futures. Focusing on this spectral turn in art and anthropology, this research investigates its relational potential – specifically, how ghosts present, entangle with other social agents, and reconfigure vengeful forces into reparative forms of justice.

Through ethnographic and archival studies, this research examines the 2023 exhibition RE/SISTERS: A Lens on Gender and Ecology at the Barbican Centre in London. It analyzes a recurring theme across multiple ecofeminist visual artworks in the exhibition: how Indigenous women and nature, both as haunted presences historically marginalized by colonialism and neoliberal capitalism, dissolve their ontological boundaries and achieve the poetics of solidarity through coexistent, affective entanglement. For instance, in Pamela Singh's displayed photographs depicting Chipko women protesting against the local government and industry by embracing trees with their own hands to resist the exploitation of the forest environment, the dark, wrinkled skin of the women and the rough tree bark appear to merge into one entity through visual representation of monochrome film, conjuring a shared fate of life and death.

Bringing together debates from the anthropology of art and the ontological turn in anthropology, particularly the frameworks of animism (Descola, 2020) and onto-poetics (Mathews, 2009; 2017), this research critically analyzes the mechanisms of poetics-making that transform once-exploited Indigenous women and nature from ghostly others into agentive, collective actors that call for activism. This analysis makes an original contribution by examining two mediating roles in shaping such haunting relationalities: (1) the female body as a medium that substitutes texts and symbols in poetics-making in conventional surrealist frameworks, dissolving ontological boundaries between Indigenous women and nature and generating uncanny aesthetics; and (2) the camera as a medium of invocation that facilitates reciprocal meaning creation among Indigenous women and nature as subjective entities. These discussions challenge prior assumptions that ghosts operate in the intangible, unmediated presence across ontological boundaries; instead, they reveal how ghosts are embodied, mediated, and made to collaborate in social actions within contemporary art worlds. This offers insights into theorizing hauntology/ontology in anthropology and imagining a new relational ontology.

Fictional Histories, Storied Landscapes: Constructing Memory at Waco's Lover's Leap

This paper examines how media and circulation cemented the ghost story of Wah-Wah-Tee, a fictional "Waco princess" who leapt to her death from Lover's Leap, in public memory in Waco, Texas. Drawing on digital, archival, and autoethnographic fragments, I analyze how Decca Lamar West's 1912 *Legend of Lover's Leap* and *An Historical Sketch of Waco* constructed a civic myth that sutures a particular national identity to landscape through narrative similarities. Engaging the work of Benedict Anderson, Keith Basso, JoAnne Yates, I explore how the ghost story functioned not merely as folklore but as a medium of collective memory, allowing imagined publics to cohere around racialized absence and territorial belonging. Rather than focus on the story's factual veracity, I trace its circulation across print, oral history, tourism, and archives to ask how it became sedimented as local knowledge. I accompany this inquiry with the creation of a zine to reflect and reframe the ghost story's media life and its role in public discourse. Ultimately, I argue that the story's endurance is haunted by the continued Indigenous presence it seeks to occlude, revealing the ghost not as historical residue but as a figure of ongoing colonial entanglement.

Notes on the Latin American Menstrual Movement

In Latin America and the Caribbean there are 166 million people who menstruate (Weinberger et al., 2024). Because menstruation has historically been regarded as a "women's issue," it has been kept secret, with taboos and misconceptions surrounding it (Tarzibachi, 2017). Menstrual stigma and discrimination contribute to the devaluation of women, as the disclosure of menstruation often leads to negative reactions and the objectification of women's bodies (Johnston-Robledo & Chrisler, 2013; Roberts et al., 2002). Therefore, activists' work is essential for uplifting voices and advancing on menstrual rights. Since the early 2010's, Latin American women have met in informal

spaces to challenge menstrual taboo and stigma. During the past ten years, the Latin American menstrual movement is taking shape (e.g. bills on menstrual rights are surging as well as menstrual health and education programs), thus advancing towards better conditions for menstruators.

The work of Latin American menstrual educators and activists is part of a broader movement: the global menstrual movement-a burgeoning and contested space that seeks to make menstruation a public issue (Gaybor & Harcourt, 2022).

This flash presentation will introduce the Latin American menstrual movement, a transnational movement that is working against menstrual discrimination and violence while fostering menstrual health. Through activism, grass-roots organization, menstrual education projects and advocacy for bills on menstrual rights, menstrual activists and educators all over Latin America are forging a menstrual movement for bettering the lives of girls, women and people of all genders that menstruate in the region. The Latin American menstrual movement is questioning colonized views on menstruation, embodiment, gender and the body, as Latin American women, have been deemed "inferior" by Europeans, who even considered Indigenous menstrual blood as more pathological and inferior to European women menstruation (Eraso, 2015).

Through menstrual activism and menstrual education projects, participants of the movement engage in discussions around embodiment, gender, health, feminism and decolonization, working for social transformation and a society that supports menstruators experiences.

Based on preliminary multi-sited ethnographic fieldwork for my PhD. dissertation, which includes participation in menstrual education conferences, courses and outreach activities, as well as analysis of pedagogical material of the movement and semi-structured interviews with menstrual activists and educators from various countries, this presentation will introduce the ways in which this social movement is been forged, the ways in which it combats menstrual discrimination and menstrual violence and how menstrual activists and educators are promoting menstrual health in the communities were the work.

Presenter(s): Sofia Cifuentes

Recording Layered Realms of Play: Children as Builders and World Creators in Adventure Playgrounds

What happens when children confront and remake spaces haunted by adult intention? This study examines how children redefine boundaries within adventure playgrounds-spaces of creative autonomy often overlooked in educational discourse. Using Multivocal Annotated Layers and child-led still photography, the research analyzes the anti-aesthetic and carnivalesque dimensions of play across sites in New York, Chiba, Tokyo, Berkeley, and Sacramento. Revealing how children animate "living middens" of discarded material, engaging in layered decision-making and dialogue across contexts. This discourse revalues play as a vital practice of childhood and challenges dominant frameworks of educational space and design.

Presenter(s): Lucius Von Joo

Tracing Healthcare Violence Otherwise: Feminist Multimodal Ethnography with Women Living with HIV

This paper proposes a critical theorization of violence as experienced by women living with HIV (WLHIV) in Chile, combining anthropological analysis with a multimodal, arts-based methodology to examine the embodied and relational dimensions of violence in healthcare settings. The presentation departs from visual works created by collaborators to explore the entanglements of violence and resistance from their perspectives. While dominant discourses often position gender-based violence as a risk factor for HIV acquisition, this research inverts that logic by exploring how an HIV diagnosis can catalyze new and intensified forms of violence-intimate, institutional, and symbolic.

Grounded in multimodal methods informed by long-term ethnographic fieldwork in southern Chile, the study traces the lived effects of stigmatization, misrecognition, and systemic neglect within healthcare environments. Through a combination of photographic collaborative *mise-en-scène*, surrealist collage, and felt-based narrative-making (inspired by Helena Třeštíková), the project foregrounds the subjective experiences of WLHIV, centering their voices, agency, and modes of expression.

Intersecting the multimodal with feminist modes of "making-with" that contribute to debates around the "politics of invention" (Dattatreyan and Marrero-Guillamón, 2019), the project emphasizes iteration, collaboration, and care throughout the process with WLHIV, who act as co-creators. This way of worlding enables a phenomenologically attuned analysis of violence as it is embodied, negotiated, and relationally enacted (Merleau-Ponty, 1945/2012).

The paper engages with Judith Butler's (1999, 2004, 2009) concept of "normative intelligibility" and Silvia Federici's (2004) analysis of the biomedical governance of women's bodies to interrogate how healthcare systems differentially assign worth and recognizability to bodies. Moving across Scheper-Hughes' (1992, 2004) work on institutional harm, Bourgois' (2009) theorization of intimate violence, and Rita Segato's (2013) notion of the pedagogy of cruelty, the project illuminates how violence becomes inscribed in bodies, clinical spaces, and internalized through everyday encounters. Healthcare is thus not approached as a neutral domain but as a contested site.

This research reveals how violence is not only experienced but also reproduced relationally, both within and beyond healthcare institutions. It challenges traditional framings of WLHIV as passive victims, instead highlighting their creative strategies of resistance.

Ultimately, the paper argues for a politically grounded and phenomenologically sensitive understanding of healthcare violence-recognizing the entanglements of body/state, care/abandonment, and voice/silence. In doing so, it reimagines health not merely as access to biomedical services but as a relational and intercorporeal practice where resistance is enacted through creativity, resilience, and collective becoming-with.

What I see, What you see: A Feminist Political Ecology analysis of ethnographic photographs from Rural South India

Water [the presence of, access to] is a base human necessity. However, reliable access to water for rural households has rarely been prioritized throughout the history of modern India. In lieu of this, in 2019, the Indian Government introduced the Jal Jeevan Mission (JJM), a government initiative meant to provide safe and adequate drinking water through individual household tapped water connections for all rural households by 2024. This work leverages a feminist political ecology framework to examine how people's relationship with water resources are changing in rural South India as the JJM program poses to bureaucratize, privatize, and modernize access, management and knowledge of water resources. A multitude of ethnographic methods drive the project, with a particular emphasis on photography. Photography has been, typically, a method used by ethnographers to capture their field site and represent the life and experiences of the communities within the phenomenon they are studying (Pink, 2004). In an interest in working differently, I am inspired by Wendy Redstar's work, 1880 Apsáalooke (Crow) Peace Delegation, and have aimed to build from her method and process of outlining and annotating photographs to bring together local (gender, caste and religious) perspectives, government narratives, my experiences, and environmental factors (climate, landscape and hydrological) back into the photographs. This process allows for easy engagement with the communities I am working with; I can put into a single photograph analysis and the experience of water within rural South India.

Presentation(s): Art and Memory Activism in Bali, Indonesia

This project explores how political artists in Bali are using visual and performance-based art to challenge dominant narratives surrounding Suharto's New Order regime (1965 – 1998) and its legacy in contemporary policy. Special interest is given to how artists are addressing the 1965-66 'communist' genocide, a brutal massacre of an entire ideology that resulted in a rearrangement of Indonesian identity and allowing for the rise of Suharto's New Order. The New Order government employed extensive top-down memory work to suppress public discourse of the event and shape official understandings in a way that both justified the massacre and villainized the victims – an

effect that has been exacerbated in Bali due to the island's reliance on the tourist economy set up by New Order economic policy. However, this project investigates how memory activism—a term I use to describe the use of art as a tool for political memory activism—creates space for alternative histories to emerge. Drawing on interdisciplinary literature from memory studies, visual culture, and anthropology, this project investigates how Balinese artists engage with the past to shape contemporary policy.

Preliminary research for this project was conducted in the summer of 2024, where I was able to meet with a few political artists that confront New Order legacy and the negative effects of tourism. I will return to the field this summer 2025 to further investigate this argument. Through ethnographic fieldwork, interviews, and visual analysis, I will explore the mediums, messages, and motivations of artists whose work addresses 1965. I will also analyze how spatiality contributes to the political power of their public works. Place is significant in Balinese Hindu cosmology, as the physical and spiritual realms (Sekala and Niskala) are deeply intertwined. I am interested to understand the potential significance of these haunted (angker) mass grave sites, many under tourist infrastructure, and the agency of the dead in activist art. Ultimately, I will answer the research questions; to what extent are politically engaged artists in Bali participating in memory activism and how are their works challenging dominant narratives of the past?; and what is the significance of place in Balinese memory activism? The results of this study will be presented at the AAA conference.

This research contributes to memory activist literature by addressing the role of public political art and performance in bottom-up memory work. It also engages in the broader conversation of how communities resist historical erasure through creative, embodied forms of knowledge production, highlighting the emancipatory potential of art-based memory activism.

Presenter(s): Alyx Bontrager

Cultural Crossroads: Expressions of Identity, Resistance and Belonging on the Texas-Mexico Border

Place is central to the formation of identity and tradition within a community. The cultural scenes along the Texas-Mexico Border—such as festivals, murals, food, and local arts—serve as both a reflection of historical cross-border interactions and a form of resilience and adaptation to contemporary challenges and complex intersections of culture, history, and politics for border communities. Combining the academic disciplines of Anthropology and History, this project will utilize ethnographic and open-source mapping methods to examine how cultural practices, traditions, and artistic expressions along the Texas side of the Rio Grande reflect and respond to the social, historical, and geographical dynamics of the U.S.-Mexico borderlands through an interactive digital map. By documenting and mapping these cultural practices, the project aims to demonstrate how the borderlands foster unique, dynamic cultural expressions that are deeply tied to place and community.

Presenter(s): Andrik Gonzalez

Digital Hantulogi: Ritual Innovation and Spectral Bricolage in Indonesian YouTube Horror Communities

This research examines the emergent ritual practices within Indonesian YouTube horror communities, where content creators actively enact spiritual engagement through digital mediation. Based on digital ethnographic fieldwork and close analysis of ritual performances by prominent Indonesian horror YouTubers such as Alvin Vajhrin, Java Bros, and Son of Dad, I analyze how these creators construct what I term "haunted interfaces": digital spaces where technological affordances and spiritual epistemologies converge to produce new forms of supernatural experience and authority.

It is a part of a larger research project on "digital hantulogi" that aims to decolonize and conceptualize how digital platforms enable novel configurations of ritual practices that embrace the complexities of spectral worlds. In this particular project, I look at how YouTubers engage in "spectral bricolage," tactically assembling ritual elements from diverse sources - ranging from global horror tropes like Bloody Mary to local spiritual traditions - to create hybrid ceremonial practices uniquely suited to digital contexts. This bricolage serves multiple functions: connecting content to international horror trends while asserting distinctly Indonesian supernatural identities; establishing creator authority while maintaining connections to traditional spiritual knowledge; and creating affective experiences that resonate with viewers navigating between global media cultures and local spiritual sensibilities.

Rather than documenting spiritual beliefs as static cultural artifacts, I analyze ritual enactment as a distinctive mode of knowledge production that reconfigures relationships between spiritual specialists, spectral forces, and broader communities. The research reveals how Indonesian horror creators approach ritual not merely as entertainment but as experimental interfaces for testing the boundaries of supernatural reality, developing a digital supernatural vernacular. These practices demonstrate how digital media technologies do not necessarily diminish spiritual belief but instead enable its creative reconfiguration, offering young Indonesians opportunities to reshape spiritual worlds from the bottom up while remaining embedded within broader religious and political contexts. By examining these digital ritual innovations, this research contributes to anthropological understandings of how spiritual authority and supernatural knowledge are transformed in the digital age.

Presenter(s): Arsisto Ambyo

Ghosts in Motion: Rhythm, Trauma, and Collective Liberation

Historical events like colonialism, slavery, and segregation leave spectral imprints on present-day societies and bodies. The event has passed, but its ghost remains. This paper argues that the pain of those times, as well as sacred knowledge lives in the bodies of individuals. Through the use of rhythm, collectives are able to experience healing on a generational level. Dances which were started in traumatic times, or shortly thereafter, act as a portal for ancestral wisdom and the processing of trauma through the body, enacting healing on a physical, mental, and spiritual level.

We can see this with how the expression of rumba evolved. Slaves had chains at their ankles while dancing, forcing them into limited foot movements. They adopted exaggerated hip movements, as that was the part of the body most free to dance. Such dances are framed not just as coping mechanisms, but as active sites where improvisation allows participants to connect with, retrieve, and share ancestral knowledge. The historical banning of drums and certain dances is presented as evidence of their recognized efficacy in cultivating collective power. Evidence points towards a collective spirit aiming to resolve their lineage injustices. This liberation through movement and rhythm was a threat because it brought power to the people, allowing dance to serve as a facilitator for ideas of resistance, something elites were not too fond of. Through following dances from their origins to their present day form, this paper aims to uncover the ghosts embedded into rhythmic patterns of the body, most commonly seen through dance. It analyzes the evolution of these rhythmic traditions to demonstrate how dance movements function as conduits for ancestral wisdom, offering pathways for contemporary healing and the resolution of historical injustices.

Presenter(s): Audrey Conley

Ghosts in the Freezer: Zombie Meat and the Embodied Nostalgia in Post-Socialist Urban China

What kinds of ghosts haunt the refrigerator in post-socialist China? This paper examines the fridge not only as a domestic storage device but as an archive of spectral memories-where expired meat, hoarded food, and frozen parcels sent by distant kin embody the residues of past traumas and moral worlds. Focusing on elderly residents in a former work-unit compound in Beijing, I ask how practices of stocking and freezing preserve not only food but also the moral logics of scarcity and care that resist erasure under market-oriented reforms.

These everyday acts of hoarding-often pathologized as irrational or excessive-are in fact deeply embedded in embodied remembrance and what I term involuntary nostalgia: a form of memory that is not verbalized, but enacted through bodily routines and material accumulation. By tracing these ghostly values, the paper engages broader debates in anthropology on material memory, post-socialist temporality, and the spectral politics of welfare and abandonment.

The paper draws on 20 months of ethnographic fieldwork conducted in urban Beijing, including long-term engagement with elderly residents, observations in their kitchens, and interviews about domestic routines and past crises. Particular attention is paid to "zombie meat"-frozen, long-expired foods that remain untouched, yet carefully preserved. These objects, mundane and haunting, index a moral world in decline and a state infrastructure in retreat.

I argue that the refrigerator serves as a material archive of ghostly value systems-where the ethics of thrift, survival, and care are materially sustained despite their displacement by neoliberal governance. These ghostly accumulations reflect not nostalgia for the socialist past per se, but a struggle to maintain moral orientation amid bureaucratic neglect, suspended redevelopment, and post-socialist liminality. In doing so, the paper contributes to anthropological debates on memory, infrastructure, and the spectral life of political transition.

Presenter(s): Orlando Zhu

Myths as Maps toward an Ecological Otherwise

This ethnographic work is situated on a 12-acre plot of land, where an immigrant-led cooperative farm attempts to build other ways of worlding in the wake of the one dying through mutual aid and solidarity economy practices. Carving out other ways of knowing, being, and doing must necessarily contend with place, the violence and possibilities embedded in the land and in our bodies, that both forward other ways of worlding and impede on their capacity to thrive.

As poet Sophie Strand reminds us, myths have historically been used to help us understand our ecological relationship to a place – when to gather, when to make medicine, how to be part of a community, how to act, who to trust. Myths offer us a language to grieve, to reckon with violences wreaked, moral lessons to follow, and the capacity to imagine other worlds. In this presentation, I explore how myths, as both stories and practices, can guide us toward an ecological otherwise, urging us to tend to the ghosts that linger – those of the land, ancestors, animals, plants, spirits, and ourselves. In the face of overlapping crises, how might we turn to myths to re/imagine and re/define pathways toward abolition and collective liberation?

Drawing on the cooperative farm as a case study, and joining calls from anthropologists moving us toward the speculative, I examine how myths can and do inform practices that shape how we might live and die well together as we plod along in the chaos of our times.

Presenter(s): Meredith Degyansky

The Shadows of 'Becoming Independent:' Aspirations and Sexuality among North Indian Youth

This ethnography explores how young unmarried Indian adults currently residing in Chandigarh navigate their sexuality. From fieldwork during the years 2021-2022, the study's findings aim to address the following research questions: How is sexuality constituted in the lives of young people living in Chandigarh, India? How do various social institutions configure and consequently politicize sexuality in young people's everyday lives while living in Chandigarh? Participant in this study included cis-gender and queer individuals between the ages of 19-23 of whom predominantly compose the middle-class in Chandigarh. The participants shared their personal stresses, sexual curiosities, and personal and professional aspirations. These concepts help them negotiate power within both the private and public domains and allow them pathways to diverge from or conform to the sexual scripts (Gagnon and Simon 1974) embedded in these domains. I showcase how Indian youth in Chandigarh diverge from social norms or cultural scripts in a bid to fulfill their own desires.

This presentation details what young people's sexual aspirations are, how these aspirations are formulated, and what significance they hold in their lives. Sexual aspirations are linked to certain class-associated expectations, which can only be understood in the context of caste (Kang 2024). Long-term sexual aspirations are tied with the desire to "become independent," which, for the participants, means to attain economic success and secure financial independence. Participants vocalized the aspiration of "becoming independent" as the gateway toward freedom and the necessary agency to make decisions, including choosing who their life partner would be or what their life might look like on their own terms with a career. Here, the participants were alluding to

their adherence to the expectations of a neoliberal middle-class subject. Becoming independent, then, is the framework within which young people understand their sexual aspirations as aligning with middle-class, social expectations often supported and upheld by upper caste standings. I argue young people coming of age in contemporary India are negotiating their aspirations as they recursively revise the sexual scripts they encounter in their daily lives, while also traversing their intimate self-making negotiations across social position of age, sex, caste, class, and gender. Ultimately, this study outlines the gendered realities of sexuality within a heteropatriarchal society that shadows the 'becoming independent' framework youth strategize to pursue their aspirations.

Presenter(s): Manjot Multani

To Be a Young Ximi in Beijing: Sonic Subcultures and Ideological Fashioning among China's Urban Youth

Xiqu is an umbrella term for many subgenres of traditional Chinese theater, which involve dance, pantomime, acrobatics, poetry recitation, and singing. In the early twentieth century, xiqu was perhaps the most popular form of public entertainment in China. Today, it is far from being mainstream. Xiqu fans are given the special moniker ximi, a word which literally refers to persons who are enthralled or even obsessed with theater. For a young adult, to be a ximi means taking up a socially tenuous position. It also demands the cultivation of everyday sensory and bodily practices that mainstream society deems strange and repulsive. This presentation will explore why xiqu nonetheless appeals to its fans, including an analysis of how young ximi navigate issues of ideological affiliation, class dynamics, and community belonging through the sonic practices that structure their leisure time. Following Bourdieu and Ranciere, previous anthropological studies of expressive culture have tended to emphasize how aesthetic preferences are consistent with class positioning and ideological dispositions. In contrast, I will analyze xiqu's attributes that are visceral (based on the senses, emotions, and the body) in addition to those that are ideological (based on logical, verbal associations). This conceptual distinction will allow me to demonstrate how ximi are self-contradictory and creative thinkers. It will also allow me to explore the complex heterogeneity of contemporary Chinese society.

This presentation will be based on 12 months of ethnographic fieldwork conducted between summer 2023 and summer 2025. My presentation will discuss this fieldwork in detail, paired with analyses of audiovisual media and online social networks. Drawing on anthropological traditions that focus on China, the senses, technology, and aesthetics, I will consider what the xiqu fandom reveals about China's first generation to have been raised by the pioneers of the reform era. In sum, I find that xiqu enables its young fans to strategically make claims of affiliation and continuity with a wide variety of Chinese historical eras and philosophical schools. In doing so, they interrogate their relationship with tradition, socialism, and the international order.

Presenter(s): Elijah Ash

3604 The Legacy of Ernesto de Martino (Part II): Rituals and Temporalities

Start Date: 11/21/2025 2:30 PM **through** 11/21/2025 4:00 PM

Venue: Marriott **Room:** Balcony K

Type: Oral Presentation Session

This year marks the 60th anniversary of the death of Ernesto de Martino (1908-1965), a founding figure in Italian anthropology whose ghost still looms large in the Italian tradition, continuing to inspire countless works today. De Martino's thinking is incredibly timely for the current state of world crisis, as demonstrated by his masterwork on apocalypse (*The End of the World*, published in English in 2023). Bringing together established as well as junior scholars, this double session interrogates the legacy of de Martino's eclectic thought from various angles, providing the opportunity to think with him and acquaint a broader audience with his work. In line with critical "world anthropologies" perspectives, the sessions counter anthropology's anglophone hegemony by focusing on a brilliant anthropologist who is not widely known outside of Italy.

Part 2 considers how the theoretical influence of de Martino's work often transcends the Italian context. De Martino's theories on the crisis of presence, apocalypse, magic and ritual have significant impact on analytical frameworks at the core of anthropological research, including temporality, historicity, and religiosity. Presenters in part two showcase the reach of de Martino in contexts including Catholic eschatology, psychiatric care, and the Afro-Brazilian diaspora. The panel furthers the comparative project by bringing de Martino into conversation with key figures of thought in anthropology, such as Victor Turner and Claude Lévi-Strauss. All papers speak to the relevance of de Martino's concepts in contemplating the events of today, including how collapsing worlds of polycrisis signal the need to rethink our relationship to time, history, and even 'reality' itself.

Presentation(s): The ritual process. The instituting anthropologies of De Martino and Turner

My research project presents one of the first systematic comparisons of two important 20th century anthropologists who both studied the structure of rituals in preindustrial societies: Ernesto de Martino and Victor Turner. It draws from the ethnographies of the two anthropologists to sketch the basic skeleton of a ritual process or mechanism that exists across cultures and societies. At the heart of this mechanism is a dialectic between the structure of social organisation and the anti-structure of the ritual moment, or between order and conflict, *nomos* and social normality on the

one hand and individual creativity and subversion on the other. Both anthropologists give central importance to the two sides of this dialectic in their particular ritual theories. Through a detailed comparison, my project opens up several key overlapping themes between the two thinkers, such as the question of whether the integrative/post-ritual phase represents a moment of conformity and repression, or instead the necessary foundation for a wider collective sense of social belonging; and what the relationship between the ritual process/mechanism and moments of crisis may be. This comparison between De Martino and Turner suggests that ritual and rituality are instituting processes able to contribute to the continuous re-creation and renewal of a specific society or community. Such a conclusion opens wider questions on the essentiality of rituals in society and their role in the contemporary world.

Presenter(s): Alyssa Erspamer

The reality of reality. Going back to the early de Martino to grasp the world of schizophrenia

In *The End of the World*, Ernesto de Martino, describes schizophrenia as the most philosophical of illnesses. Schizophrenia, he argues, illustrates how a world can collapse, leaving individuals outside any conceivable horizon of meaning and agency, destroying the sense of reality. However, in his second major work, *Il mondo magico*, de Martino raises a fundamental question: what defines reality? This question takes on particular significance when examined through an ethnographic lens, highlighting what we could call the problem of the reality of reality. How should we deal with extra-ordinary experiences like the imaginary constructs of a delirious patient?

This paper explores the "reality of reality" through the lens of early de Martino and existential psychiatry, particularly Binswanger's work, within an ethnographic framework. Drawing on ten years of fieldwork in psychiatric institutions, I argue for the necessity of conceptualizing the existence of a patient's world. Ultimately, I propose three key arguments: 1. taking Otherness seriously requires expanding the Western concept of reality because 2. reality is not an absolute ontology but a historically situated way of articulating the world. In closing, I aim to argue, in the wake of demartinian reflections that 3. a shared framework of psychiatric care is only possible through continuous negotiation of foundational concepts such as world, reality, and truth.

Presenter(s): Luigigiovanni Quarta

The uncanny valley and the unsettling of the landscape: Catholic AI eschatology through the lens of De Martino's *The End of the World*

This paper draws on De Martino's investigation of cultural apocalypse to reflect on the eschatological character of the encounter with AI. Taking as its starting point De Martino's well-known engagement with the case of the Bernese peasant, it considers how this characteristic account of the unsettling of the landscape resonates with the concept of the 'uncanny valley' – the sense of unease in the presence of that which emulates the human, leaving us with an unnerving sense of people and things being not in the right place. I take as my case the emerging Catholic response to the potential epochal change wrought by AI, articulated in the recent Vatican note *Antiqua et nova*. There we see a grappling not only with AI but how its co-option of the word

'intelligence' unsettles our understanding of human intelligence. In this encounter we see what De Martino described as a crisis of presence: indeed, implicated in this crisis is not only a dislocation of the human body, but a notion of 'intelligence' that lacks presence. What manner of apocalypse emerges from this encounter with the uncanny valley?

Presenter(s): Judith Irvine

De Martino for Unprecedented Times(?)

'Unprecedented' has become a marker of our time, denoting the supposedly unparalleled magnitude of the entangled challenges facing human beings as we hurtle toward the middle of the turbulent 21st century. The unprecedented label imbues an event with a sense of urgency and the need for immediate action, but also has a subtext that implies that the problem is insurmountable, thus foregoing accountability and action. Through de Martino's work on time and crisis, this paper investigates the relationship between the unprecedented and an increasing sense of existential 'presentness' and analytical 'presentism'. In crisis, time can be experienced as speeding up or slowing down, swirling and surging, and throwing one off in all manner of trajectories. There might be a hyperconsciousness of being present inside, outside, or alongside time, manifesting in uncanny feelings and heightened senses. The familiar texture of the present – in the sense of the historical continuity grounding the present – is lost. In this respect, crisis turns ordinary daily routine inside out and exposes the seams of temporality to view. de Martino helps usurp the popular 'unprecedented' trope that is so readily applied to events today by disrupting assumptions on mono-dimensional historical consciousness, the linear progression of time, and the importance of being present in the present as the cornerstone to creating novel history.

Presenter(s): Daniel Knight

De Martino, Dehistorification and Transcendence

This paper seeks to explicate one of de Martino's most intriguing ideas, 'dehistorification' (deistorificazione), a term that he deployed to call attention to the ways in which people may overcome crises such as paralyzing anxiety or melancholia. Participation in religious rituals, in his view, mobilizes stories and choreographies where the suffering person addresses the crisis that threatens their existence. Dehistorification describes this momentary escape from the inexorable unfolding of present misery into a level of metahistory where the cord strangling the present is cut. The individual reiterates archetypal scenarios where heroic figures overcame obstacles. In identifying with these metahistorical successes individuals (and collectives) find the energy to re-enter their present lives. Immersed in collective support and moral values they step back from the edge of dehumanizing misery and regain a foothold on social life. I will set de Martino's ideas in relation to parallel ideas by his contemporaries such as Turner (liminality), Lévi-Strauss (the sorcerer and his magic) and Eliade (in illo tempore). And I will illustrate dehistorification by reference to dream journeys to the beyond that I collected on the island of Naxos (Greece). The idea of dehistorification does possibly bear some marks of 1950s functionalism which need to be

considered on the way to deciding if destorificazione can be a fruitful idea for contemporary anthropology.

Presenter(s): Charles Stewart

Afro-Brazilian Cults through de Martino's Perspective: The Terreiro as a Project for World Regeneration

It has been nearly 50 years since the posthumous publication of *La fine del mondo* by Ernesto de Martino, and in a post-pandemic scenario, under the devastating effects of climate change and on the brink of a third world war, the threat of the apocalypse still presents itself as an imminent risk. However, the face of this widely perceived apocalypse takes radically different forms between the Global North and South. Based on an ongoing fieldwork bridging Europe and Brazil, this article aims to offer a reflection on the apocalypse as perceived within the African diaspora in Brazil and its repercussions in the European context, through the analysis of two Afro-Brazilian religions on both sides of the Atlantic. In the apocalyptic scenario, the umbanda and candomblé terreiros are conceived by the community of followers as collective projects for the regeneration of the world, as they have managed to withstand centuries of human and environmental destruction caused by colonialism and slavery. The purpose of these communities is to respond to the threat of "the end of the world", viewed as the "white disease" of binary, racist, and colonialist thinking, with terreiro epistemologies capable of proposing a different relationship with the environment and with human and more-than-human collectivity. African-rooted religions could thus be interpreted as a decolonial alternative able to restore that "intersubjective project" without which, echoing de Martino, no possible world can exist.

Discussion

7454 Eerie Overlaps in Food Sovereignty and Nationalism: Part Two

Start Date: 11/21/2025 2:30 PM **through** 11/21/2025 4:00 PM

Venue: Marriott **Room:** Balcony L

Type: Oral Presentation Session

Food justice, food sovereignty, food security, and efforts to ensure access to good food are generally understood as positive goals, but when people with commitments to ethnonationalist ideologies or advocacy for punitive criminal justice efforts can be under the same umbrella as emancipatory, racial justice, and anti-colonial efforts, then the umbrella concepts deserve greater scrutiny and examination. This panel explores the various ways that causes drawing from opposed political viewpoints can fall under the same food politics, and how we as anthropologists should respond to that reality.

Presentation(s): A Rural Agrarian Reckoning: Multigenerational Farmers Seeking to Repair Soil, Agriculture, and Rural America Itself

Across U.S. agriculture, a small but growing subgroup of rural, multigenerational farmers are thinking about their own culpability in American agriculture's past and present, and desiring to change. This research studies producers in the American South and Midwest who are transitioning away from conventional practices towards environmentally and social repairing approaches, and reckoning with what this entails. Drawing from 16 months of ethnographic fieldwork and interviews with 73 participants from 47 farms, this research follows producers questioning internalized ideologies, collaborating with plants, animals, and microbes to repair degraded soils, making breaks from family and institutions, and creating networks to align with others. These activities are often contentious within their communities and are intertwined with debates around politics, nationalism, and belonging. This paper pieces apart the unfolding, murky relationship between these farms' projects of ecological repair and the simultaneous rhetoric of regenerative agriculture's reparative effects on rural communities. Unpacking concepts of health, value, and community, my findings demonstrate a fundamental tension happening in US environmentalism and American ruralness itself: are the changes these farmers are working toward antithetical or counter to rural America, as their critics (including family & neighbors) often imply, or are these changes the very thing necessary for rural America to thrive (or revive)?

Presenter(s): Sydney Giacalone

Haunting Hungers: The Ghosts of Food Insecurity and Youth Violence

Food insecurity lingers like a ghost in the daily lives of many youths, an unseen but deeply felt presence that influences their actions. Building on ethnographic research at the Felege Hiywot STEAM Farm Camp, an Indianapolis urban gardening program for teens, the "ghost" experience of hunger and violence amplifies structural inequities that low-income and Black teens experience. While their everyday effect exudes resilience and energy, in surveys these kids express the catalyst for anger and violence that hunger can become. To navigate this ghost experience of food insecurity, the teens recommended providing more food pantries and community gardens, building acts of defiance, and encouraging shared meals. Framing their ideas with the broader discussion on food sovereignty and nationalism, we examine how youth perceive hunger as a societal failure with far-reaching consequences that reinforce violence. Here, we argue that their voices illuminate the ghost impact of failing policies to address food apartheid that continue to shape food access in the U.S. To conclude, we invite everyone to consider how addressing food insecurity can prevent youth violence. In amplifying the voices of these teens, we envision confronting the ghost of food insecurity that leads to hunger and violence in our communities. We encourage that food accessibility and security be ensured for all where food becomes a tool for peace rather than physically felt violations.

Ghosts in the Garden: Urban Youth, Memory, and the Politics of Good Food

Food sovereignty is often framed as a liberatory project rooted in resistance, care, and justice. Yet under the same conceptual umbrella of "sovereignty," we increasingly find both anti-colonial movements and exclusionary ethnonationalist agendas. This paper examines how shared food language—centered on autonomy, reclamation, and identity—can obscure deep ideological divergences. Drawing on ethnographic fieldwork with BIPOC youth in urban farming programs in Indianapolis, IN, I explore how "good food" becomes a site of negotiation: materially grown, emotionally remembered, and politically charged. Youth define a "good meal" not solely through nutrition or production, but through sensory memory, cultural belonging, and emotional satiation. Their reflections reveal that food sovereignty extends beyond land—it's also about healing, recognition, and relationality. These farms function as social infrastructures, where soil holds both displacement and possibility. Yet these spaces are also haunted by the uneasy proximity of conflicting political projects. This paper proposes that community farms are haunted infrastructures—repositories of ancestral hope, structural violence, and speculative futures. It asks: What happens when shared food ideals travel across contested terrains? And how might anthropologists remain critically attuned to the political ghosts embedded within food justice vocabularies?

Presentation(s): "Haunted Ecologies: Environmental Destruction and the Spirits of the Land"

With rapid climate change and the growth of extractive industries, the adverse impact on land has become more than an ecological and geopolitical concern—it is now an ontological and emotional rupture. This paper examines landscapes that have been ecologically damaged as places of tangible injury and mourning, haunting, and memory. This paper draws from anthropological debates, such as animism, affect, political ecology, and environmental justice, to explain how communities undergo loss. Gordon's concept of haunting helps define it as a socio-political force. At the same time, Povinelli's geontopower informs this paper by illustrating how absence dominates frameworks of nonhuman agency, ancestral presence, and historical trauma. The work encompasses the Athabasca River in Alberta, where the extraction of tar sands is framed in

Indigenous resistance as spiritual desecration, and the Mississippi River in the corridor of 'Cancer Alley' in Louisiana, where petrochemical landscapes intersect with the Black and Indigenous histories of displacement and death. It also includes the Salton Sea and the Amazon, which are globally recognized as sites of ecological devastation. Boundless secondary sources inform it, including Indigenous testimonies, environmental justice reports, ethnographic literature, and artistic and news responses. It constructs the idea of 'haunted ecologies' as both affective and discursive formations. Stratified in these cases is the notion that landscapes serve not only as passive witnesses to the violence of extraction but also as active agents of memory and resistance.

Using discourse and document analysis, this paper ethnographically interprets media coverage, environmental evaluations, and public memorials through the lens of 'narratives' and employs a multi-sited analytical approach. It uses multispecies ethnography and relational ontology, drawing from Deborah Bird Rose and Marisol de la Cadena, to ask how land is imbued with spirit, kinship, and grief. The paper claims that haunting operates simultaneously as cultural critique and political action, used by those who witness what environmental violence attempts to annihilate. The paper attempts to construct a spectral, affective, and cosmological approach to ecological harm and, in doing so, proposes a fresh understanding of environmental violence founded on the remembrance, erasure, and resistance of obliterated lands.

Cyclical time-beings: the liveliness of the ocean and the arrival of the mud of Samarco in the Degredo quilombola community in Brazil

In November 2015, the Samarco (BHP and Vale joint venture) dam tailings collapsed in Minas Gerais, southeast Brazil. The tons of toxic mud traveled 600 km and arrived at the ocean, harming many communities through the path, including the Degredo Quilombola community in Espírito Santo, southeast Brazil. Quilombola people descend from African enslaved people and compose over 6,000 quilombola communities in all the Brazilian regions. They are characterized by their particular way of communal living, kinship relations, Afro-descendancy, and interactions with the land and nature.

Since the arrival of the mud, the Degredo community has been part of the ongoing repair process that intends to compensate, mitigate, and repair the damage caused by the most significant environmental disaster in Brazil's history. Degredo's population used to be fishers in the ocean and rivers, and they had deep connections with these beings, who, for them, were alive and whole. This perspective demonstrates connections between Degredo's population and their whole environment. This local concept refers to what one of the griots told me for the first time in 2019 when I started working with the community regarding the Samarco dam tailings collapse repair process.

Through seven months of fieldwork from July 2023 to February 2024, I was introduced to the practices of the community. Activities like the dance of Jongo, fishing, cassava flour production,

and medicinal plant use reveal a worldview where "nothing is half-done, all things are whole," as one of the main griots in the community used to say. The community's practices align with the African and Afro-Brazilian principle of circularity (Nego Bispo 2015, 2018, 2023), reflecting the cyclical (Fu-Kiau, 1994) and spiral time-wisdom (Martins, 2021). This is performatively embodied in the Wheel of Jongo, where I argue that circular movements enact the cycles of the territory and the quilombola ecological practices. My research is an invitation to leave the certainties of linear time and plunge into a world where beings are animated by cyclic time to discover a new conception of life.

In this paper, I explore how Degredo's people conceive the ocean as a cyclic living being, the fishing techniques they developed with the whole environment and the whole beings, and how it affects their explanations about the arrival of the mud of the Samarco dam tailings collapse. Through fieldwork examples and people's narratives, I raise discussions around relationality and new animism from an Afro-diasporic perspective.

Presenter(s): Nathalia Dothling Reis

From Tetrapods to Terabytes: The Ghosts of Deep Time Relational Values in the Shallow Time Expansion of Digital Infrastructures on Ireland's Coast

With its exponential growth in digital infrastructures and renewable energy development, data and energy - or what Bresinhan and Brody (2022) dubbed the "moebius strip of wind/data" - infrastructure growth in Ireland provides a unique tapestry of the interwoven currents guiding (and being guided by) twenty-first century big tech growth, climate adaptation, and the tensions between globalisation and local communities. Recent scholarship has largely focused on the socioenvironmental entanglements of – and greenwashing tactics – around the proliferating data centre-scape in eastern urban Ireland on the outskirts of Dublin (Brodie 2020a) or on the backlash against big tech insurgence in larger western coastal towns such as Galway (Brodie 2020b). Drawing from desk research on the historical trajectory of telecommunications infrastructure growth in rural west Ireland from the original Transatlantic telegraph station on Valentia Island to fiberoptic cable landing stations that connect the global Internet, and site visits and fieldwork from Valentia to the subsea cable landing station and community of Killala (County Mayo), this talk explores the historical unfolding and present entanglements of data and energy infrastructures where cable landing stations have for centuries connected largely rural spaces at the stop gap for global and regional connectivity, and where grazing fields, coastlines and community football pitches are increasingly overshadowed by the towering whirl of data centres and wind power turbines. Leaning into Anna Tsing's notion of "friction", which "reminds us that heterogenous and unequal encounters can lead to new arrangements of culture and power" (5), this talk explores the tentative windows of local agency, from the telegraph's role in bolstering international support for the Irish Rebellion to one fisherman's fight against new Internet infrastructure construction, sparked by these otherwise largely colonialist and extractive technologies that ultimately pull energy and capital back to the international offices of big tech on Dublin's Silicon Docks.

Presenter(s): Hunter Vaughan

Seasonal Ghosts: Nostalgia, Ecological Change, and the Haunting of Time in Southern Chile

In this paper, I explore how ecological transformations and seasonal rhythms in southern Chile are experienced through affective registers of nostalgia and haunting, based on ethnographic fieldwork with women living near native forests and berry cultivation zones in the Araucanía region, I examine how the landscape itself becomes a site of memory, desire, and loss. The arrival of summer is intensely felt, not only for the warmth and vibrant social life it brings, but also due to the latent fear of its imminent disappearance, marked by the onset of new seasonal changes. As the seasons shift and autumn and winter approach, which in the Southern Hemisphere span from March to August, conversations are charged with a quiet anxiety about the climatic transformations at hand. The onset of cold, long rains, and the shift in the air are perceived as a ghostly presence drawing near, evoking a sense of finitude and ecological mourning.

I argue that climate change and seasonal transformations are not merely environmental events, but embodied experiences that structure emotional and social life. The notion of ghosts becomes a useful tool to understand how temporalities—both climatic and affective—are sensed, narrated, and anticipated. The ghost of the cold, of winter, or of a vanishing landscape reflects broader anxieties about ecological degradation, altered temperatures, and changing patterns of life in rural southern Chile. Nostalgia, in this context, is not only about the past but also about feared and foreclosed futures. Through fieldnotes, diary entries, and sensory observations, I suggest that the landscape is haunted, by memory, by climate, and by the looming transformations of the Anthropocene.

Presenter(s): Angela Alvarado Florez

The Memory of Helene: Conceptualizing Resilience and Recovery Within the Arts Community in Asheville, North Carolina

While the concept of ghosts often brings up images of the deep past, some of the most haunting memories are those that remain freshly imposed on the landscape. This is the case for people striving to recover after Hurricane Helene while confronting physical reminders of the destruction. One culturally-important site that was decimated was the River Arts District (RAD) in Asheville, North Carolina. The RAD housed many artists' galleries, shops, and studios, and was a major tourist hotspot within western North Carolina. This research seeks to address the ways in which the physical medium of art (whether lost in the storm, damaged, or remaining after the storm) and artists' engagement with the RAD through the process of recovery memorialize their experiences of Hurricane Helene. How do they conceptualize and connect with art and place, and has that changed post-Helene? Although the research is in the beginning stages, proposed methods for investigating disaster through a lens rooted in art, emotion, and sense of place will be discussed, along with the guiding question of what resilience actually means to those who carry the memory of disaster.

To Haunt With, Not Study: “Big Lizz” and the Ethics of Black EcoFeminist Invocation

This presentation engages the legend of Big Lizz, a towering Black woman said to haunt the Greenbriar Swamp near DeCoursey Bridge on Maryland's Eastern Shore. According to regional folklore, Lizz was enslaved, betrayed her Confederate captor by aiding Union forces, and was beheaded after helping bury a chest of gold in the swamp. Locals say she still appears if summoned through a ritual at the bridge.

Rather than extract meaning from her haunting, I propose a methodology grounded in haunting with. I treat Big Lizz not as an object of study, but as co-researcher, witness, and ancestral collaborator. Combining folklore studies, ethnographic fieldwork, ecological observation, and ritual performance, this work unfolds through embodied site visits and spiritually grounded practices.

I visited DeCoursey Bridge multiple times. At midnight, I engaged the local folk ritual and created my own. During daylight, I observed plant life, water movement, and the emotional and spatial textures of the swamp. I developed a personal ritual grounded in ancestral care, rooted in permission, silence, and reciprocal presence. The work emerges from a commitment to story with, not over.

In addition to poetic fieldnotes and folklore analysis, I conducted water quality testing, soil analysis, and botanical biodiversity surveys using a quadrat. These practices support an ecological reading of the site as memory keeper. The land, water, and plant life are not background. They are part of the archive. They co-haunt.

This ecological data offers insight into how the swamp holds grief, witness, and resistance. The swamp as an extended embodiment of Big Lizz and of myself. The research draws from Black feminist ethnography, hauntology, and speculative method. It centers ritual as a legitimate form of knowing and remembering, and extends the idea of the specter as more-than-human.

This presentation reimagines Big Lizz and frees her from the limits of a ghost story.

She is memory, resistance, and refusal to vanish.

What does it mean when the swamp itself becomes a collaborator?

When haunting is not unrest, but return?

How can we understand being haunted by the present?

Through landscape sketches, ritual cartography, layered images, and sensory fragments, the presentation offers a quiet invitation into swamp, spirit, and story. I argue that haunting is a methodological offering. It is a form of care and critique for researchers navigating silence, absence, and the afterlives of violence.

Guided by the ethics of Black feminist invocation, I position haunting not as spectacle, but as practice. Not as performance, but as care. Sometimes the impulse to document must yield to the need to witness. Through Big Lizz, we are invited to listen. We do not need to master the story, but to move with it. To haunt with her is to remember her. To walk with her is to see the land differently. The bridge is not the end.

Presentation(s): An Ethnography of Measurement: Innovation Metrics for Life After Oil in the Arab Gulf

For the countries of the Gulf Cooperation Council (GCC) – Bahrain, Kuwait, Oman, Qatar, Saudi Arabia, and the United Arab Emirates (UAE) – the second half of the twentieth century was a period of petroleum fueled, fast-paced development. As the continued sustainability of this oil-funded growth has become questionable, GCC governments have started imagining what their post-petroleum socioeconomic futures might look like. At the moment, and in concert with what is very much a current policy trend across the globe, the GCC regimes are focusing their efforts on innovation and going to great lengths to quantify, and sometimes benchmark, their shifts in that direction.

Yet, while all of this might be in line with the objectives and calculative management practices of policymakers, some caution is warranted about what it truly means to try to put this into practice and to try to gauge the outcomes at a national level. This is because innovation itself can be a very nebulous concept that gains no clarity when it is leveraged as a new economic model or pillar of modern-day statecraft and, as the GCC cases clearly illustrate, things quickly get even muddier with innovation when it is cast as a quantifiable, objective target that can comparatively measure countries in terms of how much or how little of it they have.

This paper looks at a particular aspect of how those efforts at innovation for development are being quantified and benchmarked as policies. Specifically, this research presents the GCC as a case study that shows exactly how notions about innovation are, if anything, very transmutable and indefinite concepts that are morphed into something seemingly concrete once they undergo quantification. In other words, the argument here is that attempts to quantify and measure innovation in the hopes of securing the golden ratio – or the perfect recipe – that will spur national economic growth runs the risk of taking something that is very disorderly and, through numbers and models, giving it the appearance of abstract orderliness that can be managed.

Finally, after an overview of some of the actual models that are being used for measuring innovation at the national level, this discussion will raise the possibility that there is an underlying difficulty in determining whether or not the innovation measurement instruments are actually measuring real world state-level innovation or if they are simply gauging a representative model of innovation that they, the instrument makers themselves, have created.

Ashkenormalization: Cantorial melodies, Persian immigration to the US, and Jewish assimilation in the 1960s

In their award-winning 2024 podcast *The Nightingale of Iran*, sisters Danielle and Galeet Dardashti document the self-discovery that their father Farid, a retired cantor originally from Teheran, undergoes as he comes to terms with his assimilation into American Jewish religious practice while in his late teens and early 20s. Born in Teheran, Farid grew up in the presence of his acclaimed father, Younes Dardashti, a famous maestro of *avaz*, which is an improvisational form of classical Persian vocal performance. Younes never taught his son the art, however. Farid had to find his own brief teen fame singing pop songs on Iranian TV for a few months in 1961-62, before he traveled to the United States for education. Eventually, he found a dream fulfilled in cantorial school and a successful professional career chanting prayers in synagogues. This route was fraught with difficulty, however, given the extreme attitudes against professional musical performance that Younes faced among the tiny Jewish community of Iran--Younes' devoted fans were nearly all Muslims. His son Farid ran up against similarly implacable attitudes among American Jews regarding the "correct" Jewish melodies for synagogue prayer--Ashkenazi or European ones. Farid inadvertently followed his father's example by failing to teach the Persian melodies of his childhood to his daughters (who include a cantor and a rabbi). This presentation begins by briefly reviewing the history of public attitudes toward musical professions in the Middle East, in Iran, and among Jewish communities thereof. The presentation concludes that not only religious identities come into play, but also class formations in Iran and the United States.

Presenter(s): John Schaefer

Beyond Prison Walls: Unseen Images and Stories from Lebanon's Former Prisoners

Imprisonment is a well-documented human experience – almost exclusively, however, from the perspective of the incarcerator. The perspective and experience of the incarcerated is less visible. One of the many ways in which incarcerating regimes document and chronicle incarceration is through a variety of dehumanizing images: arrest photographs, crime-scene images, "wanted" posters, etc. Carceral states actively disseminate such images while purposefully obscuring the violence, neglect, and brutality perpetrated behind prison walls. The public, in short, sees only what the incarcerating regime wants it to see.

There are other images being produced about incarceration, though these are less

widely disseminated and consumed. While conducting fieldwork for my ethnographic research project on Lebanon's carceral system, I found that formerly incarcerated people employ artistic and imagistic modalities to express their painful, contradictory, and non-chronological experiences of carceral violence. Prisoners produce a diverse assortment of artworks, illustrations, pictures, stories, and objects. These images offer alternative testimonies of prison life while destabilizing the dominant narrative presented by the carceral state.

In my presentation, I outline the main tenets of the "imagistic" research methodology I employ to make room for and understand the different images that formerly incarcerated people produce. Then, I proceed to discuss the images themselves, exploring how violence is visibilized and invisibilized through practices of image-making. Why are former prisoners drawn to image-making? What does it offer them? How can image-making resist and memorialize carceral violence? How does image-making fill the gaps left by memory holes and hauntings? I conclude by reflecting on what we can learn from the agentic practices of former prisoners who chronicle their experiences, against all odds, through images and stories, amidst a landscape that profits from their dehumanization and brutalization.

Presenter(s): Lara Sabra

On Ambiguous Seismic Time: Exploring the Limits of Futurity in Istanbul's Disastrous Landscape

Governance of impending emergencies has predominantly been studied through a futurist lens, revolving around concepts such as uncertainty (Button, 2010), risk (Mills, 2019), or anticipatory action (Anderson, 2010). This work highlights the limits of futurity and contributes to the recent literature that foregrounds the analytical and material significance of social memory in governing disasters yet-to-come (Gulum, 2024; Kroepsch et al., 2018). Based on ethnographic fieldwork with a volunteer Urban Search and Rescue (USAR) team in Istanbul, the study investigates how these professionals temporally situate themselves in preparing for the expected Grand Istanbul Earthquake. In an urban context laden with recurrent devastating earthquakes, their professional practice unfolds within a unique temporal terrain, theorised here as ambiguous seismic time—a temporal condition shaped by the tension between uncertain yet inevitable futures and unresolved catastrophic memories. Focusing on the team's training sessions, this research examines symptomatic temporal ruptures manifesting in the conflictual self-imaginings of USAR professionals as both experienced rescuers and potential victims: Enacting "as-if" scenarios, seeking to make future disasters palpable in the present, yet the epistemic value and reliability of these anticipatory tools are often disrupted by the spectral presence of their experiences in past devastating earthquakes in Turkey. Those ethnographic moments set a broader conversation regarding existing bureaucratic inertia, urban precarity, and Turkey's prevailing memory regime organised around manufactured amnesia; all delimiting the possibilities for meaningful anticipatory action.

Specters of Resistance: Withheld Bodies and the Haunting of Palestine

In Palestine, the bodies of individuals killed in confrontations with Israeli forces-referred to as martyrs by Palestinians-are frequently withheld by Israeli authorities, preventing families from performing traditional burial rites. This practice has given rise to persistent rumors of organ theft, as families fear their loved ones' bodies are being subjected to unauthorized harvesting. These fears are not baseless: historical cases have documented such violations (Scheper-Hughes & Boström, 2013), and recent reports have reignited these concerns.

These withheld bodies, along with the rumors surrounding them, function as spectral presences within Palestinian society. They embody the suspended grief of families, the systematic confiscation of time (Sbeih, 2024) imposed by the colonial regime, and the broader context of structural violence that pushes the colonized subject into a necropolitical condition-the "living-dead" (Mbembe). Their physical absence transforms them into ghosts that haunt both personal mourning and the collective Palestinian consciousness.

Yet these detained martyrs, though disappeared, continue to exert influence. As catalysts for mobilization, they challenge the mechanisms of control and erasure imposed not only on their individual bodies but also on their communities-rendered invisible and targeted for annihilation under settler-colonial domination. Drawing on the words of Palestinian political prisoner and intellectual Walid Daqqa-who died after 38 years in Israeli prison and whose body remains withheld-this presentation takes inspiration from his play *The Martyrs Return to Ramallah* (2024), in which the liberated ghosts of detained martyrs come to lead the revolution. Through ethnographic fragments and an analysis of these haunting phenomena, this presentation explores how spectral

figures become symbols of both loss and resistance, illuminating the political potency of the ghost in a landscape marked by ongoing dispossession.

"An (Im)Possible Reconciliation: Copts, Jihadis and Everyday Peace in Provincial Egypt"

States and societies around the world are engaging with questions of how to live with religious and cultural difference. Middle Eastern states, in particular, appear in political and journalistic discourse as incapable or increasingly failing to accommodate religious and cultural diversity. Unprecedented sociopolitical turbulence in many Arab states, combined with the proclivity of anthropologists to study committed piety movements in isolation, has resulted in anthropologists also overstating the level of separation between religious groups in Middle Eastern societies. This paper fills this gap by exploring a simultaneously mundane and exceptional manifestation of religious diversity in contemporary Egyptian society. Set amidst the tumult of the 2011 Arab Spring, and based on over four years of ethnographic fieldwork, this paper illuminates local forms of revolutionary politics, reconciliation and communication at an unlikely interfaith dialogue event between Coptic Christians and Jihadis (militant Islamists). First, the paper surveys histories of identity, border-making and interaction between Ghadi groups and Copts in Egypt. The second section examines the political interests and calculations which brought Coptic and Ghadi leaders together for a June 2011 conference. Documenting meetings and dialogue before, during and after the conference, the paper reflects on local processes of intention, meaning and peace. It shows how, despite the often pragmatic, episodic and fragmentary nature of the Coptic-Ghadi exchanges, the interfaith relationship resulted in very concrete manifestations of everyday peace. This conclusion, in turn, speaks to the perennial significance of local forms of community, peacebuilding and non-Western approaches to living with difference.

7857 What Haunts the House: Chronotopes, Capital, and the Unruly (After)lives of Place

Start Date: 11/21/2025 2:30 PM **through** 11/21/2025 4:00 PM

Venue: Marriott **Room:** Bonaparte

Type: Roundtable/Town Hall

This roundtable returns to the haunted house not as a static metaphor, but as a persistent trope through which place is made-and unmade-under the pressures of nation-building and capital expansion. Working across anthropological subfields that engage sites such as ruins of the recent past, borders, museums, and tourist resorts, we ask: what makes a haunting, and for whom? Exploring these questions through this assemblage of perspectives and contexts, we draw on Bakhtin's notion of the chronotope (Bakhtin 2006) alongside the concept of the hyperobject (Morton 2013), to consider how specific places become overdetermined by national and capitalist logics, saturated with affective and ideological force. From this vantage point, we trace how narrative techniques are deployed as a means of chronotopic levelling to render certain pasts invisible and certain futures inevitable by attending to what these processes cannot fully contain: the residues, resistances, and presences that persist in spite of material and narrative erasure. Through these spectral (Derrida 2006) disruptions of spatial and temporal enclosures, chronotopes of the uncanny (Eckhard 2011, Freud 2003) emerge in which repressed spectres of the past are returned to the present through the temporal dislocation of space in the classical tradition of the ghost story, by the haunting of a house. From the persistence of Indigenous memory in bordered lands to the unruly archives and the ruins under luxury resorts, these papers explore what haunts the present house even after its story has been written.

5164 Work and Social Transformations in African economies viewed from below

Start Date: 11/21/2025 2:30 PM **through** 11/21/2025 4:00 PM

Venue: Marriott **Room:** Galerie 1

Type: Oral Presentation Session

This panel examines how structural transformations are reshaping African economies, with particular attention to the lived experiences of traders, workers, and social groups operating across urban and rural spaces. Amid accelerated integration into global markets, the adoption of new technologies, shifting trade routes, and evolving extractive regimes, African economies are undergoing profound change. These dynamics generate both new opportunities and new forms of

vulnerability - experienced unevenly across geographies, class positions, and social relations. The papers in this panel engage critically with the contemporary structural dynamics shaping African economies, with particular emphasis on transformations in labor. Contributors examine how shifting economic regimes - marked by increasing informalization, precarization, and new forms of extraction - intersect with enduring structures of class, gender, and age. Through ethnographic attention to traders, workers, and entrepreneurs navigating precarity and opportunity, the panel explores how labor is organized, valued, and contested across different contexts. Together, these contributions offer grounded insights into how broader political-economic shifts are mediated through everyday laboring lives, and how inequality, aspiration, and survival are negotiated in the wake of structural change.

Presentation(s): Working the waterscapes: popular water labor at the Chad-Cameroon borderland

Residents of the Chad-Cameroon borderland require everyday labor to survive and navigate the complexities of local water landscapes. Such essential labor includes efforts towards ensuring access and supply of drinking water but also managing water excesses during the rainy season. Indeed, fountain managers, porters and technicians of the national water corporations (STE in Chad and CamWater in Cameroon) are among the workers who strive to provide water to local households networks by carrying cans, building boreholes or pounds, and maintaining pipes and handpumps among other critical activities amid limited resources, uncertainties and the absence of universal standardized. In addition, water-related disasters such as flooding are allegedly becoming more frequent in a context of climate change and impose significant amounts of labor to protect communities by establishing large-scale protections (dams) through transnational development projects or with small-scale initiatives, as exemplified by sandbagging. This paper draws on ethnographic fieldwork in several towns on both sides of the Chad-Cameroon borderland to analyze water labor as part of an essential popular economy. It turns the spotlight on an original, gendered infrastructure shaped by workers' solidarity, embedded interactions with end-users and struggles against authorities. Thereby, the paper contributes to ongoing academic debates on agency, popular economies, climate resilience and natural resource management.

Presenter(s): Ismaël Maazaz

Building socio-professional trajectories in the construction sector in Douala, Cameroon.

This paper explores the multiple factors that shape career trajectories in the construction sector, whether they relate to skills, social networks, financial resources, or identity. The aim is to analyse how these various factors — conceived as different forms of capital — operate across different

categories of workers, shaping both their social positions and professional pathways. The reflection seeks to offer a critical perspective on the literature dealing with informal economies in Africa. This body of work has long been structured around a relatively homogeneous dichotomy between accumulation and survival as frameworks for understanding the experiences and trajectories of economic actors. On one hand, there are small entrepreneurs oriented toward accumulation; on the other, informal economies are seen as primarily composed of precarious workers engaged in survival strategies. In contrast, this paper proposes a sectoral approach to African urban economies, moving beyond the limiting category of the "informal economy." The objective is to examine, at the level of a specific sector, how access to diverse forms of capital structures economic activity and determines career opportunities — that is, the possibility of establishing a lasting presence in the profession by seizing perceived opportunities such as becoming a technician, setting up a craft workshop or a small construction company, or securing public procurement contracts. The analysis is based on qualitative study.

Presenter(s): Ludovic Bakebek

Invisible Legion: The Political Economy of Informal Own-Account Work in Sierra Leone and West Africa

Informal own-account work is ubiquitous in contemporary Africa. For millions of workers who cannot find adequate wage work, own-account work is their last line of survival. However, few scholars have offered a class or labor-centric analysis of own-account workers, usually conceptualizing them in de-classed terms as entrepreneurs, small-business owners, excluded semi-proletariats, or market innovators. This chapter offers a different perspective, applying the peasant-studies concept of the "commodification of substance" to the urban context of own-account workers and introducing the concept of "the irregular army of labor," a novel contribution to the Marxist theories of the "reserve army of labor," to analyze own-account workers as essential parts of both domestic and global working classes maligned to precarious petty trading in the face of the structural inadequacy of the formal labor market across Africa.

Presenter(s): Joshua McDermott

Mobility, Capital, and Precarity: Configurations of Trade in Contemporary Kinshasa

This paper draws on ethnographic research among Congolese traders working at different scales in Kinshasa's imported clothing and hardware sectors. While the DRC's import trade has historically been dominated by expatriate traders from Southern Europe, West Africa, and more recently Asia and the Middle East, increasing numbers of Congolese traders now engage in transnational circuits, traveling to Guangzhou, Istanbul, or Dubai to source goods. These new mobilities reveal both the globalization of Kinshasa's urban economy and internal hierarchies within the trade sector. Transnational traders – those able to cross a threshold of financial capital – are better positioned to accumulate wealth, as their goods yield higher margins in local markets. In this context, mobility itself becomes a form of capital. By contrast, traders who cannot travel rely on intermediaries or limited local stock, constraining their profits. While all traders navigate an uncertain socio-

economic environment with weak state protections, transnational traders mobilize diverse forms of capital to move beyond the precarious, subsistence-level commerce that dominates the lower rungs. This paper juxtaposes these trajectories to explore how work, mobility, and accumulation intersect in Kinshasa's contemporary economy, and how opportunity and precarity are differently negotiated across the trade hierarchy.

Presenter(s): Héritier Mesa

Class, Gender and work on the Lake Edward.

Artisanal fishing and the sale of fish at the local markets along the shores of Lake Edouard constitute the backbone of the economy in North Kivu province, in the DR Congo. This paper is based on the ethnography of the lives and practices of fishermen and fish traders in the villages surrounding the lake Edouard. This local economic activity is embedded in a broader regional network of commodity exchange between the Democratic Republic of Congo and Uganda. Within this context, this paper focuses on the concept of work in artisanal fishing and fish commercialization. This paper argues that this form of work is fundamentally a social relationship - one that is embedded in systems of value production and class consciousness. Work in this context not only structures economic roles but also delineates social boundaries, producing differentiations between the "haves" and "have-nots." Moreover, it acts as a gendered marker of distinction, shaping the social positioning of men and women within this economy and social space.

2479 Language, Environment, and Changing Climates: New Approaches to Language Reclamation

Start Date: 11/21/2025 2:30 PM **through** 11/21/2025 4:00 PM

Venue: Marriott **Room:** Galerie 2

Type: Oral Presentation Session

Around the world, linguistic and environmental knowledge are intimately bound. Through language people apprehend the material world, communicate with animate places, beings, and spirits, and transmit stories that capture underlying environmental ontologies. The transformation of natural ecologies can have profound effects on a community's vocabulary and ethnoecological learning opportunities, as well as other forms of engaging and understanding the nature of the world. In many colonial and postcolonial settings, the attempted separation of Indigenous peoples from their lifeways has included theft of local knowledge, land and the languages through which that land was named and known. Agricultural systems, food ways, ethnobotanical knowledge, medicinal practices, and spiritual and philosophical systems are found at the intersection of linguistic and environmental knowledge. Interruption of Indigenous language transmission has also involved interruption of land-based relationships and knowledge.

Indigenous activists and language promoters have increasingly linked reclamation of land and language in the pursuit of recognition and sovereignty. As Mel Engman and Mary Hermes (2021) have suggested, "local land is central to ways of knowing and being, thus it is also central to learning." Yet, language revitalization practices and materials are often haunted by colonial language ideologies and ways of knowing that focus almost entirely on reconstructing a grammar. In some cases, language is reduced to code, rather than being viewed as a complex, embodied means of knowing and engaging. In contrast, in the Americas and elsewhere, language promoters and local culture revivalists alike are increasingly connecting their activism to broad environmental and climate change concerns. They are reclaiming and reanimating environmental and linguistic practice as shared goals. Such activities surface in narratives, conversations, meeting data, and contemporary media production, pointing towards more expansive approaches to reclaiming language and culture, based on community needs and perspectives (Leonard 2012).

Papers in this panel open a conversation between linguistic and other anthropological approaches to understanding the environment. With contributions that span the globe, our presenters consider the diverse ways that linguistic and environmental reclamation intersect through explorations of place names, media technologies, health systems, agricultural practices, and genres of speaking and reading the environment. By emphasizing local, non-institutional, and quotidian forms of linguistic and environmental reclamation, this panel explores openings through which more sustainable linguistic futures may grow.

Presentation(s): Weaving Ecological Influence: Social Media and the Revalorization of Traditional Ecological Knowledge

How might community-based social media production contribute to the reclamation and revalorization of traditional ecological knowledge and related linguistic practices? For many speakers of Upper Napo Kichwa in the Ecuadorian Amazon, the plants, animals, forests, rivers, and mountains that surround them are animate beings, with whom they communicate through songs and dreams. Such ontologies shape other forms of environmental engagement from hunting to the harvesting of medicinal plants. Yet, wage labor, school, and mainstream media are influences away from the place-based knowledge of elders for younger speakers of Kichwa. Although many Indigenous Amazonian people are active on social media, relatively little of the content available to

them reflects their experiences and languages. Against a backdrop of environmental change, Kichwa activists have increasingly turned to community and social media to raise awareness of environmental injustices and to revalorize traditional environmental practices and knowledge. Grounded in long-term ethnographic engagement in the region, this paper explores preliminary results of a pilot project to collaboratively produce environmentally-focused social media content with members of the Association of Kichwa Midwives of the Upper Napo. Media production represents an emergent vitality (Perley 2013) for environmental knowledge related to health, material culture, and food ways among intergenerational participants and wider audiences.

Presenter(s): Georgia Ennis

Tlaoltzintli, dear corn: Linguistic and ideological reclamation among environmentalists and activists in Tlaxcala, Mexico

As part of an ideological resistance to the broad encroachment of Spanish and bioengineered crops, Nahuatl language activists in Tlaxcala, Mexico promote semiotic parallels between linguistic diversity and biodiversity, with Nahuatl aligned with maize and other Native crop seeds. In the central Mexican state of Tlaxcala, Nahuatl is a heritage language and sometimes first language alongside Spanish, the language of instruction in all Mexican public schools. Local language promoters including teachers, writers, poets and families concerned about the rapid decline of the use of Nahuatl in Malinche region homes contribute to language reclamation projects across the state. Youth engaged in these language reclamation efforts themselves share Nahuatl on social media. There has been a parallel interest in the renewal of local environmental and linguistic knowledge, particularly with the Mexican movement to block crop bioengineering. People interested in promoting local, heritage crop production have entered into conversation with language activists creating an ideological reevaluation of hyper-local discourse of linguistic and environmental knowledge. Based on extensive field work in this region this paper analyzes data from language activist meetings, environmental events and social media.

Presenter(s): Jacqueline Messing

Revitalization, knowledge and self-determination in the Zapotec diaspora

Sovereign entities and institutions have played a determining role in Indigenous language reclamation projects in the Americas (Davis 2018, Dennison 2024). In Oaxaca, Mexico, an entanglement of state-sponsored programs, such as the Intercultural Bilingual High School (BIC) system, and institutions that train Indigenous teachers (like CEDELIO) engage in top-down management of language instruction and revitalization. In contrast, non-institutionalized attempts to revitalize Indigenous languages have been episodic in their engagement with diasporic communities in Mexico and the US, particularly in "Oaxacalifornia" (Cruz-Manjarrez 2013, Gellman 2023, Stephen 2007). This paper examines the production and circulation of works by Zapotec intellectuals, including Dilla Walhall, a dictionary and phrasebook compiled by the educator Ricardo Ambrosio over a 20-year period to promote the use of a Zapotec variant from his hometown, Lashichhij. This dictionary and other works promote the use of local terms to

emphasize the environmental diversity in communities that local intellectuals reclaim as Indigenous and autonomous in Oaxaca. This strategy focuses in part on the identification and naming of animal and plant species that constitute a shared body of knowledge for diasporic communities. My presentation theorizes these efforts as a rhizomatic framework that fosters diasporic self-determination through non-institutional, individualized efforts (Deleuze and Guattari 1980, DeLanda 2006).

Presenter(s): David Tavaréz

"My roots nestle deep:" A Navajo poetry of place

This paper begins by looking briefly at the history of documenting Athabaskan/Dene placenames by Mescalero and Tolowa language activists. It shows how in both the Tolowa and Mescalero Apache case, placenames were vital to language reclamation efforts. It then turns to the work of Keith Basso on Western Apache placenames and moral discourse and building on Basso's suggestion that poets know well the evocative and moral work of placenames, it turns to the use of Navajo placenames in contemporary Navajo poetry. To begin that discussion, I look at a Navajo philosophy of language that highlights the importance of sound (a Navajo acoustemology). From there, I turn to the sonic and visual qualities of Navajo placenames and the careful attention they show towards attending to the environment—Tóniil'aha'nii 'sound of something moving in water out of sight.' This is then reiterated in a series of examples from a variety of poets (from the first poem published in Navajo to more recent work). For many poets, the use of placenames establishes "roots" with a place. It concludes by looking at the politics of Navajo placenames as they relate to a controversy over Laura Tohe's book Tséyi': Deep in the Rock. Here we see the way that a moral history and a humane attention to the environment are interwoven through placenames.

Presenter(s): Anthony Webster

Voices in the Honey Forest: Vibrant Encounters, Linguistic and Environmental Survival in Turkey's Hemshin Lands

This paper explores the links between language and the environment by tracing the ongoing "becoming" of Hemshin environmentalism among Hemshins "returning home" to Turkey's Hemshin town. As the Hemshin landscape is dramatically transformed by the growing investment and infrastructure projects, partly driven by IMF-imposed liberalization of the agriculture and energy sectors after 2001 (Erensü 2018), Hemshin people are increasingly engaged in a process of "reading" and rereading (Matthews 2017:G153) their landscape, while they participate in emergent Hemshin environmentalism. Within this process of "reading" Hemshin landscapes, young Hemshins unexpectedly encounter many linguistic and material traces, which inspire them to think about and act against environmental degradation in their lands, provide them with resources to be used to fight against destructive development projects, and induce a process of reestablishing bonds with and a reclamation of Hemshin lands, language, past knowledges, and lifeways that have been severed, due to generations of the structural violence of Turkish nationalism, outmigration and socio-economic transformations. Attending to the agentive roles of language and

other non-human beings, such as trees, in the shaping of Hemshin environmentalism, selfhood, and socialities, I show how language and the environment mutually constitute one another creating possibilities for the revitalization of traditional agricultural practices and Hemshin language.

Presenter(s): Neşe Kaya Özkan

Losing the language of spirits: Changing linguistic practices and environmental Knowledge in Sulawesi

Among the Gorontalo of Sulawesi (Indonesia), like many Indigenous groups in the world, relationships with the environment have traditionally been mediated through spirits. These spirits, called *lati*, must be addressed with special language to provide rain and avert pests. The language includes profanity that would not be permitted in normal conversation. Although the Gorontalo have been Muslim for hundreds and years with a long history of syncretism between Islam and traditional practices, recent social and political shifts in Indonesian culture have been creating new taboos about a number of customs, including communicating with *lati*. In this talk, we explore the traditional discourse strategies and linguistic forms of communication that are used with *lati*. We contextualize them within Indonesian social norms and practices, drawing comparisons with other groups that also traditionally communicated with spirits as a way of interacting with the environment. This research highlights how linguistic practices related to *lati* not only reflect cultural beliefs but also embody critical environmental knowledge essential for sustainable agricultural practices. We examine how the diminishing belief in the involvement of *lati* in sustainable farming relates to environmental degradation, as many farmers neglect these traditional practices in favor of modern agriculture that relies on toxic chemicals and discuss perceptions of these rituals by the wider Gorontalo community.

7033 Interrogating Indigeneity: Deconstructing a Haunted Concept

Start Date: 11/21/2025 2:30 PM **through** 11/21/2025 4:00 PM

Venue: Marriott **Room:** Galerie 3

Type: Oral Presentation Session

As scholars have begun to use indigeneity as a lens for understanding the struggles of ethnic minorities in increasingly varied contexts, tensions in the concept are exposed. Scholars (Morton 2017; Pelican 2009; Sugimoto 2019) have argued that indigeneity as a lens can problematically flatten complex histories, result in a messy struggle over "first-ness", essentialize nuanced cultural practice, and erase the struggles of other groups. Leaning into the complexity of indigeneity as an analytic, this panel takes on the task of interrogating indigeneity, its relationship with sovereignty and settler colonialism, and the particular kinds of power hierarchies it describes. Looking at ethnographic contexts from the Middle East, this panel follows Cattellino and Simpson (2022) in exploring how the conjunctures of anthropology with different scholarly traditions might offer opportunities for thinking through indigeneity.

Cattelino, Jessica R., and Audra Simpson. 2022. "Rethinking Indigeneity: Scholarship at the Intersection of Native American Studies and Anthropology." *Annual Review of Anthropology* 51: 365–81. <https://doi.org/10.1146/annurev-anthro-101819-110339>.

Presentation(s): Interrogating Global Indigeneity: The City of David

The issue of indigeneity has been as central to the subject of Palestine/Israel as it has been ill-defined. Jewish Israelis increasingly feel the need to "prove" their indigenous status, corresponding with the larger themes of twentieth-century colonialism and the rise in decolonial action and discourse. The "City of David," an archaeological-touristic site run by the settler organization ELAD in the Palestinian neighborhood of Silwan in East Jerusalem, is an extremely popular destination for Israelis and international tourists alike. The site combines archaeological research, biblical references, notions of purity, and embodied performance to prove an exclusive primordial Jewish connection to the land. Based on fieldwork that includes taking tours of the site, analyzing tour guides' rhetoric, attention to the audiovisual exhibitions shown to tourists, and studying the texts provided with each artifact, I will examine the ways in which a critical view of the site shows how our conventional understanding of indigeneity as pure, fixed, and "naturally" autochthonous, rather than a category built through oppressive power relations, is highly problematic and enables the co-optation of the language of indigeneity in pursuit of the foreclosure of a reckoning with and rectification of the actual violent power hierarchy in place.

Presenter(s): Niv Likwornik

'Indigenous, not Christian': Secular Separations and Decolonial Sovereignty in Global Assyria

In 2014, ISIS took control over large swaths of land in Iraq and Syria. Iraq's minority communities and especially Christians were specifically targeted by the group leading to the forced displacement of hundreds of thousands. Christian displacement by ISIS was read by Western (and particularly Christian) politicians and policymakers as part of a larger concern over the future of Christianity in the Middle East and global Christian persecution. During this onslaught, a new generation of Assyrian diaspora organizations was formed in places like Detroit, Chicago, and Washington DC to aid and advocate for kin back in the homeland, as well as unify an ecclesiastically divided diaspora into a movement for indigenous rights. This paper asks: How is indigenous sovereignty in northern Iraq (espoused by transnational Assyrians) shot through secular mediations of ecclesial forms of kinship and contextualized by colonial legacies and imperial presents? In tracing the shadows of secularity in the geopolitics of concern over Middle Eastern Christian suffering, this paper broadly explores how we may be better able to parse a decolonial approach to the intersections of Christianity and indigeneity in the Middle East, that exceeds Western, neo-colonial instrumentalization.

Presenter(s): Candace Lukasik

The Politics of Yezidi Indigeneity: Centering Displacement and Dispossession in Scholarly Analysis of Iraqi Yezidi Identity

Since the ISIS attacks on the Yezidis of Shingal in August 2014 that displaced hundreds of thousands, Yezidis in the US, Europe, and Iraq have established many NGOs focused on rebuilding Iraqi Yezidi villages and advocating for international protection for Yezidi land. Many of these groups have begun to use the language of indigeneity to describe the political and economic effects of colonialism and imperialism on their communities. This framing is controversial—particularly in how it places Yezidis vis-à-vis their Kurdish neighbors, who are also engaged in their own bids for sovereignty sometimes rooted in identification as an indigenous people. Based on a combined 22 months of fieldwork with Iraqi Yezidis in Germany, including archival research and the collection of oral history interviews, this paper explores specific episodes of Iraqi Yezidi dispossession and displacement in the 20th and 21st centuries and the ongoing consequences of these episodes in the lives of Iraqi Yezidis living in Europe. Inspired by Glen Sean Coulthard's (2014) and Patrick Wolfe's (2006) analysis of the extraction of value from land in settler colonial relations, I argue that the mechanisms of Iraqi Yezidi exploitation, displacement, and dispossession should be centered in scholarly analysis of the growing Yezidi identification with indigeneity.

Presenter(s): Allison Stuewe

Liturgical Indigeneity: Sacramental Presence, Memory, and Land in an Armenian Village in Turkey

Vakıflı, known as the "last remaining Armenian village in Turkey," sits on the slopes of Musa Dağı. It was made famous by Franz Werfel's historical novel *The Forty Days of Musa Dagh*, depicting Armenian resistance during the Genocide committed by the Young Turk government of the Ottoman Empire during World War I. While the post-imperial borders shifted, placing the survivors first in French-mandate Syria and then the Republic of Turkey, the local Armenian Christian population

continued to cultivate the land. Today, they bring organic farming techniques and longstanding customs around the Christian liturgical year together as part of their continued claim on the village. This paper explores the connection between contemporary liturgical practice, land stewardship and organic agricultural practice, and historical memory in Vakıflı. Armenian liturgical services make a link between community and place explicit. Indigeneity, a concept whose utility for describing the Armenian situation has recently been debated within Armenian studies, likewise posits a link between people and land. By focusing on liturgical tradition, theological notions of sacramental presence, and postcolonial memory of Genocide and resistance, the paper suggests alternative groundings for a notion of indigeneity that often depends on claims to land funneled through ethnonational conceptions of place, territory, and belonging.

8055 Collections Lessons: Teaching and Learning through Collections (Part 2)

Start Date: 11/21/2025 2:30 PM **through** 11/21/2025 4:00 PM

Venue: Marriott **Room:** Galerie 4

Type: Roundtable/Town Hall

This roundtable will share successes from recent experiments with collections-based learning, while reflecting critically on the pedagogical, logistical, and ethical challenges involved in bringing an "object-based" or "collections-based" focus to teaching and learning. Our discussion will be positioned alongside current efforts to decolonize anthropology museums and collections.

Object-Based Learning approaches, often grounded in multisensorial and experiential learning pedagogies, have been proposed as encouraging active learning in formal education settings (Chatterjee and Hannan 2015, Adams 2015, Kukhareva et al. 2020). Logistically, teaching and learning with collections often presents special challenges as it requires either bringing a group of learners into a museum or bringing its collections to the learners. Ethically, this approach can be problematic where it reinforces learners' authority to analyze and interpret other communities' cultural belongings, privileging the colonial gaze over the stories and voices of makers and owners of the items exposed to study (Schultz 2019, Hodge 2018).

In this two-part roundtable, we discuss collecting and curating as learning strategies that cross boundaries between museum, classroom, and community. Presenters in this session have explored museum collections in their courses to support multisensorial engagement with history and material culture (Knutson) or to encourage reflection on the relationships between meaning, movement, collection, and display (Berk). Others have worked on public anthropology projects that involve community partnerships, such as an initiative to create finding aids for collections from Mexico at the Sam Noble Museum (Nicholas), or the curation of an exhibition at the Jones Museum at Moundville Archaeological Park following a major repatriation (Brazelton & Nelson).

These and other experiences invite us to ask: What criteria and best practices can we put forward for effective, pedagogically sound, and ethical teaching and learning through anthropology collections? How can we ensure that Object-Based Learning is properly grounded in the broader perspectives and methods of anthropology as a discipline, including sensory anthropology and "engaged" approaches? And how can we ensure that our collections-based teaching and learning, in museums or in the community, contributes to decolonizing anthropological museums and education?

5064 Paranormal Panoptic Activity: New Surveillance Mechanisms in Educational Contexts

Start Date: 11/21/2025 2:30 PM **through** 11/21/2025 4:00 PM

Venue: Marriott **Room:** Galerie 5

Type: Roundtable/Town Hall

Under threat of "learning loss" during COVID-19, we experienced a collective desensitization to public surveillance of private lives (Stacy & Casar, 2023), allowing new panoptic technologies to evolve amidst an increasingly autocratic society. Today's political climate has only intensified draconian educational surveillance, forging new techniques of discipline for systems, curricula, and people challenging oppressive ideology. The quiet background hum of panoptic ghosts present in schools since inception has progressed to a more aggressive haunting of surveilling forces across all facets of educational life - and beyond. Without documentation and critical analysis of how panopticism is infiltrating education, what was once considered extreme "paranormal" activity will simply become normalized, giving "power of mind over mind" so that humans reform themselves to align with dominant forces (Foucault, 1977, p. 206). In this round table, scholars draw upon anthropological perspectives to delineate mutating surveillance tactics that are being used to advance and normalize extremist ideologies that disenfranchise marginalized communities. Mike Karlin explores how emerging education technology and generative artificial intelligence seek to continuously, unquestioningly gather, sell, and exploit student and classroom data with those outside the classroom, presenting a significant danger for both students and teachers, particularly for those who hold marginalized identities and beliefs, as they unknowingly share private information to be used in undisclosed manners. Ted Hamann discusses how Project RAÍCES, a multi-pronged home-grown teachers of color initiative, was accused of being 'pro-DEI' and abruptly cancelled by DOGE. He analyzes this disciplining and the institution's uneven response. Sepideh Yasrebi examines how technological and institutional surveillance tactics

enforce linguistic policing through hegemonic pedagogies, ultimately erasing emergent bilinguals' rich linguistic and cultural repertoires and identities. Jen Stacy depicts how Moms for Liberty has appropriated the concept of "parents' rights" to usurp democratic ideals of local control, morph regulation with censorship, and legitimize a new brand of sociocultural panopticism. Ava Kaplan considers the ways libraries are haunted sites caught between privacy and surveillance, normalization and transgression, by unpacking how librarians' feelings of paranoia materialize in self-censoring behavior and quiet resistance with regards to books about LBBTQ+ and People of Color. Jessica Sierk investigates novel forms of surveillance within sexual and reproductive healthcare that emerged leading up to and since the U.S. Supreme Court overturning Roe vs. Wade and their chilling effect on formal and informal public health education. Confronting today's panoptic ghost raises critical consciousness to dismantle current and prevent new forms of radical surveillance.

2776 Race Elsewhere

Start Date: 11/21/2025 2:30 PM **through** 11/21/2025 4:00 PM

Venue: Marriott **Room:** Galerie 6

Type: Oral Presentation Session

Race is a fundamental reality in many societies around the world, structuring social, political, economic, material, and affective life. However, following early anthropology's complicity in co-constructing race as an idea and system, the anthropological study of race has largely been confined to physical or biological anthropology, sidelining its examination within sociocultural anthropology – save a significant yet frequently overlooked body of literature (eg. Davis 1941, Drake 1945, Hurston 1935, Powdermaker 1939). More recently, there have been several calls in anthropology (Harrison 1991, Mukhopadhyay & Moses 1997, Visweswaran 1998) to study the cultural dimensions of race, alongside which there has been seminal scholarship on the anthropology of race in the US, UK, and Latin America (eg. Brown 2005, Gregory 1998, Smith 2016, Thomas 2019). This panel, however, shifts the focus elsewhere, foregrounding race as both globally and historically constituted as well as locally embedded within specific contexts in Africa, Asia, and the Pacific.

The papers on this panel enter debates about 'where in the world' race can be used as an appropriate analytic, turning to Africa, Asia, and the Pacific where race is still relatively understudied and undertheorized and where questions arise over whether other categories like 'ethnicity', 'community', or 'tribe' are more relevant or accurate. At the same time, these are areas of the world long shaped by colonial and colonially adjacent histories of race-making, and legacies of

racialized regimes of labor. They are also home to historical and ongoing massive movements of people and subject to contemporary forms of colonialism, settler colonialism, and global and local modes of racial governance. These dynamics make them rich sites to study the everyday life of racial formations, subjectivities, politics, and relations. By bringing together ethnographic work that examines race in its "vernaculars" (Pierre 2020) and beyond its usual geographies, this panel explores the theoretical and methodological challenges, frontiers, and imperatives of taking race seriously in places where its legitimacy as an analytic is often contested, yet its effects are deeply felt.

Presentation(s): Siddi Chronicles: A Historical Ethnography of a 'Racial' Category in Hyderabad, India

"Everybody knows. We were ghulams [slaves] from Africa...but we don't like to talk about it," Zarina, a siddi elder told me, referring to descendants of 19th c. East African migrants in Hyderabad. Drawing on ethnographic fieldwork with Zarina and other descendants of this community in contemporary Hyderabad as well as archival material speaking to slavery and its abolition, this paper traces this unspoken haunting and the shifting contours of race and blackness in India, through the lens of siddis. It highlights events in the 19th century—largely imperial, but also local and regional—that significantly impacted, indeed transformed, these geopolitical migrations and the meanings attached to race and slavery in India. Specifically, it argues that slavery's abolition by the British in the 19th c. is what helped to produce the object in its wake, as the many meanings and practices of slavery in India became distilled into one form, mapped singularly onto "African" bodies. As such, the globalization of race and slavery provided cover for the invisibilization of Indian slavery and the concomitant unseeing of caste and the seeing of religion in its wake. The paper will explore these shifting signifiers of slavery, race, caste, and religion in India, arguing for the long afterlives of these 19th c. events as well as their location in local and regional contexts to better understand the meanings of race outside the Atlantic world and their impacts on Zarina and others in Hyderabad.

Presenter(s): Gayatri Reddy

Capital personified: Ethnoracialization and economic sovereignty in Nigeria's Global South shift

This paper examines processes of capitalist ethnoracialization, or how increased mobilities of people, commodities, and capital amongst the Global South has precipitated new ethnoracial and national imaginaries of suspicion and political anxiety. For example, Nigerian notoriety has emerged as a global national stereotype – in relation to drug-trafficking and prolific scamming rackets – alongside global racial ones, that are ever present in Nigerian diasporic livelihoods in the

Global South. Through ethnographic and archival material, the paper revisits Stuart Hall's (2017) *Fateful Triangle: Race, Ethnicity, Nation* alongside emergent anthropological works on white supremacy (Beliso-deJesus, Pierre, and Rana 2025), racial capitalism (Huang 2024), and ethnoracialization in non-Western contexts (Byler 2022). By focusing on the multiple valences of racializing discourse - domestic ethnic stereotypes, national notoriety in of Nigerians abroad, pan-African pro-Black economic and geopolitical visions, the paper considers how racial difference is constantly regenerated at the nexus of global racial capitalism and the current geopolitical order of nation-states.

Presenter(s): Vivian Chenxue Lu

Spectral categories: Race and its Endurance in West Papua

Critical race theory has highlighted the constructed-ness of race as a social and political category. Race has been understood as a way to characterize and rank difference (Bernasconi 2018; Valls 2005; Ward and Lott 2002; Bernasconi and Lott 2000). It has also been used as a technique to organize power (Jeffers 2014) and "an arbiter of judicial architecture and procedures of the global present" (da Silva 2014). In Indonesia-occupied West Papua, race, however, has marked spectral historiography of power. While slavery and colonialism were considered to be the most important factor that shaped racial politics in most former European colonies, a more complicated history of slavery and an enduring colonial present have allowed for the effacement and conjuring of race as a social category. Drawing from Papuans' articulation of racial difference and its repression, this presentation proposes how the spectral categories of race shape the architecture of repression and liberation in the region. It also suggests that while race is made durable through an institutionalization of racism, race is made and remade through palimpsestic processes of historymaking.

Race, Sufi Power and Empire-making in central Sudan

Over the past two decades leading up to the current war in Sudan, Saudi and Emirati elites have invested billions of dollars in Sudanese land and infrastructure. This surge of Gulf-Arab investment coincided with the former Bashir regime rolling out neoliberal privatization policies aimed at decimating Sudan's small-scale agricultural sector in order to attract foreign investments in land. Far from new, this phenomenon of foreign "land grabbing" echoes previous waves of state-driven, colonial and postcolonial land dispossession. This paper will explore the ways race and non-european forms of empire-making are intertwined in contemporary struggles over land, drawing connections to histories of enslavement and racialized regimes of labor in the 1800s, when central Sudan was under Ottoman-Egyptian rule. In particular, it will focus on the words and activism of a recently deceased, well-respected Sufi Shaykh, whose analysis helps us discern and understand contemporary forms of empire-making in Sudan by revealing the "racial vernaculars" (Pierre 2020) and colonial logics of the agricultural development and charitable projects that undergird them.

8683 FLASH ETHNOGRAPHY Workshop

Start Date: 11/21/2025 2:30 PM **through** 11/21/2025 4:30 PM

Venue: Marriott **Room:** Galvez

Type: Workshop

Flash ethnography is short form ethnographic writing. Complete in only 750 words, flash essays are full unto themselves rather than excerpts from a larger body of writing. In this workshop, Carole McGranahan and Alisse Waterson will lead participants in the writing of flash ethnography drafts. We will write together, share our writings, and offer feedback including ideas for publication. All you need to bring to the workshop is your own ethnographic research. Is there a story you've been saving to tell? Or one you haven't quite figured out yet? Or want to write in different form or tone or pace? We welcome you to join us for this workshop. Together we will see what truths unfold in our writing. The flash genre is a beautiful fit with ethnography, enabling us to illuminate the world in new ways.

539 Association for Feminist Anthropology Flash Session #2

Start Date: 11/21/2025 2:30 PM **through** 11/21/2025 4:00 PM

Venue: Marriott **Room:** Grand Ballroom

Type: Flash Presentation

Presentation(s): A Quest for Certainty: Evidence-based Parenthood in Contemporary China

In recent years, "evidence-based childrearing" has gained remarkable traction in China. Promoting evidence over intuition, experience, or tradition, it redefines what counts as legitimate childrearing knowledge and claims authority through alignment with evidence-based medicine. Emerging as a grassroots movement among parents, bloggers, and pediatricians, this paradigm has rapidly expanded into a multi-platform discourse and commercial ecosystem. Why has evidence-based childrearing gained such appeal among Chinese parents? How does it establish epistemic authority in a context of institutional mistrust and patient consumerism? And how does it reshape everyday childrearing practices, constructions of childhood, and moral expectations around what it means to be a "good parent"? This paper draws on ethnographic research combining online observations in evidence-based parenting communities with interviews conducted with parents, bloggers, and pediatricians. It explores how evidence-based childrearing constructs a Foucauldian "regime of truth" in mobilizing medical expertise, digital metrics, and algorithmic visibility to naturalize certain forms of knowledge while problematizing others. I analyze how the biomedical and epidemiological notion of "evidence," redraws the boundaries of legitimate childrearing

practice, and recode previously taken-for-granted practices as irrational, risky, or outdated. In doing so, evidence-based childrearing not only establishes itself as an authoritative discourse, but also generates new forms of labor, consumption, and moral subjectivity. The study further examines how these discourses are taken up, negotiated, or resisted in everyday family life. Within households, evidence-based childrearing is not simply applied but enacted through emotionally and cognitively demanding forms of labor-what I term "learning labor." Staying informed becomes a parental obligation, requiring time, money, and cultural capital to access, interpret, and apply scientific claims. For many parents, especially mothers, this knowledge-seeking intensifies fatigue and anxiety, producing a heightened awareness of risk and a relentless sense of moral accountability for every childrearing decision. The burden of becoming an "informed parent" is unevenly distributed along gender lines: while women disproportionately bear the work of researching and implementing evidence-based advice, men are often absent. Within extended families, where caregiving is often shared across generations, conflicts frequently arise when evidence-based norms clash with embodied, inherited childrearing traditions. In this quest for certainty, childrearing is reconfigured as an epistemic project-defined by vigilance, optimization, and evidence-and governed not only by care but by calculation. What circulates as scientific truth ultimately reshapes not just how children are raised, but what parenthood means, what counts as good care, and who bears its moral weight.

The Ghosts of Motherhood: Postpartum Breastfeeding, Techno-hauntings, and the Maternal Vulnerability

This paper examines postpartum breastfeeding in contemporary China as a haunted domain where ghosts of ideal motherhood, scientific authority, and generational expectations linger in the everyday. Drawing on life-history interviews, digital ethnography, and institutional observations, I investigate the intangible yet potent presence of "maternal absence" that manifests when breastfeeding does not proceed according to biomedical guidelines or cultural norms. While conventional discourse frames breastfeeding as a purely beneficial, scientifically validated act, many mothers are haunted by specters of failure, guilt, and societal judgment when milk supply runs low or lactation is delayed. These unseen pressures often compel women to endure physical pain or invest in expensive technologies-lactation massages, herbal remedies, and breast pumps-further entangling them in a ghostly cycle of redemption and self-sacrifice.

By engaging the meeting's theme of hauntings, I foreground the spectral quality of postpartum vulnerability: the medical and familial expectations that loom like apparitions, the uncanny dissonance of technological interventions that promise liberation but often amplify a moral imperative to "do everything possible." In China, the coalescence of Traditional Chinese Medicine and Western biomedicine creates a uniquely charged landscape, where mothers confront competing medical paradigms while navigating a resurgent rhetoric of "scientific motherhood." Government policies and public health campaigns further intensify these pressures, producing an

everyday environment in which spectral traces of past reproductive mandates collide with new imperatives for maternal perfection.

In tracing these ghostly presences-social, emotional, and institutional-this research illuminates how postpartum bodies become sites for negotiating broader cultural anxieties. Ultimately, I argue that the "ghost of maternal love" is not merely a metaphor but a lived experience that unsettles binary distinctions between failure and success, body and technology, self and society. Through this spectral lens, we may better understand how the past haunts the present in the most intimate of human experiences.

The negotiated belonging of Pakistani-Hindu migrants in India: the complexity of hyphenated and intersectional social location

While intersectionality in migration research is discussed in terms of how displacement and resettlement affect people owing to their intersectional social locations, post-colonial nations have also seen hyphenated identities emerge from newly drawn borders. Following post-colonial independence and mass migration across often newly established borders, communities had to adopt new nationalities and identities while sharing cultural and religious similarities with bordering nations. Thus, postcolonial hyphenated identities, along with their intersecting social locations, raise a need to further nuance our understanding of migrant belonging without the dichotomy of country of origin and country of migration. The example of Pakistani-Hindu migrants to India is a case in point.

Drawing on empirical data collected during 12 months (2023-2024) ethnographic fieldwork in Pakistani-Hindu settlements in Jodhpur, Rajasthan, as well as 32 life story narratives of migrants, this paper aims to detail how intersecting social locations as well as postcolonial hyphenated identities play a crucial role in informing migration aspiration and in providing individuals with differential resources to claim a negotiated belonging. Thus, the paper addresses the following research questions:

1. How do the participants' hyphenated identities (as Pakistanis and Hindus) affect their perceived belonging to India after migration?
2. How do Pakistani-Hindu migrants' gender, caste belonging, class, and age affect their ability to claim a negotiated belonging to India after emigration?

Specifically, this study examines how the participants' intersecting social locations of gender, caste, class, and age operate simultaneously with their hyphenation of being Pakistanis and Hindus, affect their responses and strategies to cope with various formal and informal barriers to participation in society.

Presenter(s): Arunima Shandilya

Voices in the Ordinary: Weaving Absent Kinship in the Everyday Lives of North Korean Migrant Women in South Korea

Based on a decade-long ethnographic study of North Korean migrant women's daily lives in the Northern Gyeongsang Province of South Korea, I explore everyday practices and expressions of kinship by attending to women's voices emerging within the ordinary (Das 2007). In particular, I consider the context of the Partition of Korea where women's intimate relations with kin, friends, and neighbors become vulnerable to surveillance while they are simultaneously expected to fulfill obligations to families dispersed through their multiple migrations. Building on feminist rethinking of kinship emphasizing women's perspectives within intimate formations of family and the state, I focus on two women's stories through genealogical methods and participant observation in domestic spaces. With a particular focus on these women's searching for or refusing to search for their kin in the South, and textures of their words repeatedly revealing the failure of families, I explore how the endurance of kinship knowledge corroded by war, displacement, and economic precarity signals the intricate intermeshing of domestic and public domains. In a careful comparison of the rhythms of releasing one's voice and withdrawing it in everyday life, I describe the myriad ways they weave absent family back into the ordinary. Such gestures suggest how kinship can be understood as between the natural and the social, where its practices and expressions entail a politics of the ordinary (Das 2020), casting possibilities for repair within kinship worlds marked by unended war and state violence.

Worlding Anthropology: A Plea for A New Ethnographic Method

Anthropology, as we popularly understand it, is concerned with a scientific study of what makes us human. If this is true, then how we as anthropologists come to write about and understand the infinitely faceted notion of 'culture' is underpinned by a certain externality to the social as an anthropological object. This vision of writing the social, as I see it, myopically focuses on individuals within a social or ecological environment and the modes by which they ebb and flow within it—we are merely focusing on people experiencing a space and each other. But, how are we meant to more accurately study 'culture' if it is anything but intersubjective, that is, formed through a relation to others and to the world? Put simply, how can we more vividly portray the dynamic relation between people, each other, the world, and their experience?

I turn here to the feminist-new materialist notion of 'worlding', which in its essence, as Kathleen Stewart defines, entails an "...attunement to a singular world's texture and shine [wherein] The body has to learn to play itself like a musical instrument in the world's compositions" (Gregg & Seigworth eds. 2010, 341). Foundationally different from the notion of world-building, which is the development of fictional worlds for novels or stories, worlding as a critical, creative method invites us to reckon with entanglement, co-presence, and critical reflection upon both our semiotic and literal physical positioning in relation to others in-the-world, and to the world itself.

What I see, here, as the particular salience for anthropology is that as we continue to explore how cultural worlds are rendered and experienced affectively, we must also pay mind to a dialectical relation to people and the aesthetics of their worlds, individualized-but this is, necessarily, not to suggest that there is a binary separation between the two, if we are to consider there to be a separation between them at all. Worlding in anthropology allows for a creative, novel consideration of who lives in the world, how it is experienced, and how the world itself lends itself to the way we interpret those experiences all the same. In such a creative ethnographic practice, we grow attuned to the experience of the ordinary as a prized mode by which we are sentient, remain attentive, and hold present to different ways of being.

'A Woman Invests Her Entire Being': White Marriage as an Affective Site of Neoliberalism in Iran

Marriage practices in Iran have evolved rapidly since the turn of the century as unfulfilled expectations of intimacy in marriage have led to a spike in divorce rates, marriage postponement, and engagement in intimate partner relationships that are neither sanctioned by societal norms nor state laws. Over the past decade, the emergence of 'white marriage,' vernacular for cohabitation, has exacerbated what the state calls a marriage crisis. While prominent clerics and state officials condemn white marriage because it violates Islamic principles and causes a decline in birth rate, some Iranians prefer this conjugal arrangement to sanctioned permanent or temporary marriages. Drawing on years of ethnographic fieldwork on heteronormative cohabitation in urban cities in Iran, this paper will show that through their everyday practices, white marriage practitioners have sparked a public discussion on the politics of intimacy and forced state actors and clerics to revisit legal and Islamic debates about marriage and more broadly, about gender. This paper highlights the co-constitutive relationship between the Iranian state and society, where those who choose alternative forms of intimate partner relationships wield their power in effecting social change. In so doing, it reveals the connections between intimacy and the shifting moods of neoliberalism in a hybrid authoritarian state.

2955 The Unthinkable Boundary: Exploring Death as a Socio-Cultural Event Horizon in Medical Systems

Start Date: 11/21/2025 2:30 PM **through** 11/21/2025 4:00 PM

Venue: Marriott **Room:** MGB - Salon B

Type: Oral Presentation Session

"Event horizon" is a concept originating in astrophysics, used to describe a boundary beyond which events cannot affect or be known by an observer. Do such boundaries also exist in our socio-cultural world? In this panel, we explore cases in which death may be an event horizon, as something that cannot be thought beyond, whether as: the end point for care practices, conceptions of illness and healing, or healthcare systems' organization. We look into how the cultural constitution of death as the end point or worst possibility for humanity shapes the

knowledge claims and lived realities of practitioners, patients, medical systems, and other caregivers.

In astrophysics, any object approaching an event horizon from the observer's side appears to slow down, never quite crossing. In such a way, the event horizon is seemingly impassable, unthinkable, even though objects may indeed pass as there is no physical barrier. Through its functioning as such a boundary, event horizons fundamentally separate regions we can access and interact with from those we cannot. In other words, the event horizon organizes the parts of our universe that are within our grasp. This panel uses focused ethnographic examples to interrogate the event horizon as a possible metaphor for social forms. Why does medicine have so much difficulty taking "states worse than death" into account when calculating the relative value of interventions? Why in some health systems does hospice receive privileged status, collapsing otherwise fraught ethics, economies, and care possibilities? How does death organize parts of our medical world, including power relations, experiential perspectives, and the politics of global healthcare? What happens when there are nonetheless attempts to constitute a medical world that does not take death as its event horizon? What paradoxes may arise when death is an event horizon?

Presentation(s): Mental health and the psy-disciplines fifty years after the Vietnam War

This paper examines the event horizon of mass death through the lens of the psy-disciplines and the limits of biomedical imaginaries in Vietnam. Fifty years after the fall of Saigon, Ho Chi Minh City residents still struggle to make sense of the Vietnam War. Scholarship on the Vietnam War has highlighted the ways that the conflict and its aftermath have been remembered and memorialized through journalism and state propaganda, novels and memoirs, films and photography, and museums and monuments. I analyze the event horizon of mass death through the lens of mental health not by focusing on the the traumatic memories war survivors but rather how questions about those memories reverberate within and structure ongoing debates about mental health and illness in contemporary Vietnam. Psychotherapists describe the challenges of working with those who lived through the Vietnam War, either as their clients or the family members of their clients, as a matter of emotional intelligence (or the lack thereof). Throughout my observations of and interactions with psychiatrists, therapists, patients, and their families, the war and its scale of unimaginable suffering loomed large as an unspoken but conspicuous part of conversations about mental health. Perhaps even more unimaginable than the suffering are the ways that people survived and endured the country's traumatic history. The event horizon of the Vietnam War becomes as the starting point, rather than the end point, of care for individua

The Gravitational Pull of Death: Care, Collapse, and Meaning in a Dutch Secular Context

In physics, the event horizon marks the boundary surrounding a black hole – a threshold beyond which nothing, including light, can escape. Black holes emerge when massive stars collapse into singularities: points of infinite density where conventional physical laws cease to apply. In highly secular societies, death functions much like a metaphorical black hole, indiscriminately pulling one toward it from the moment of birth. In the absence of a spiritual guarantor – whether heaven, hell, afterlife, or reincarnation – death becomes the singular beyond of what is knowable or thinkable. Much like how approaching a black hole warps time and space, nearing the event horizon of death can be experientially, temporally, linguistically, and relationally disorienting, not only for the dying but also for family and caregivers. How, then, can one prepare for the unfathomable? In this paper, I discuss the lead-up to the death of my father, who died of COPD-related complications after a prolonged period of physical decline. I focus on processes of meaning-making around impending death in a secular Dutch context, where death is largely stripped of metaphysical significance. While palliative and end-of-life care offer some degree of certainty and control, they remain insufficient in addressing the deeper existential uncertainty posed by death's singularity. Within this space of insufficiency, my father along with those in his orbit of care sought to locate the boundary between

Terminal Prognosis as Fact:

Rendering (Post)colonialism Unthinkable through Hospice Care

This paper examines the terminal prognosis as productive of an anti-political event horizon. In St. Croix, U.S. Virgin Islands, over a century of (post)colonial disregard has created a situation in which residents face old age in the midst of entrenched poverty, consistent out-migration of potential family caregivers to the metropole, and a deeply deficient landscape of public healthcare. In this context, it is common for older adults searching for improved health to sign up for the one form of free, professional care that is reliably available to them: federally sponsored public hospice care. To become a hospice patient, however, requires an official terminal prognosis. This paper focuses on the critical and puzzling events through which these terminal prognoses are assigned, and older residents are socially transformed into dying individuals. Ethnographically tracing how these prognoses come to immediately be taken up as objective facts among hospice workers on St. Croix, this paper critically investigates the social mechanisms through which the (post)colonial trajectories that brought older adults to hospice are erased and rendered unthinkable.

Presenter(s): Devin Flaherty

Revival: Harm Reduction Beyond Bare Life

Appalachian Christians participating in addiction recovery ministries carry out their work with theologically specific understandings of death and salvation very much in mind. Where a harm

reduction program might look at the number of deaths avoided as an end in itself, these Christians instead look to help people avoid dying at least until they are saved through sincere conversion and repentance. Rather than orient to death generally as a failure in care (as we might see in some harm reduction models), Appalachian Christians attend to a different kind of temporality, seeking to avoid deaths that may consign someone to hell for eternity. There is, then, a right kind of death, and a right time for death, but death itself is not an end. Drawing on an ethnography of Christian addiction recovery ministries in Central Appalachia, this paper explores how Christian theological commitments reshape understandings of life-saving interventions. Thinking through moments of overdose and revival, we explore how the prospect of overdose brings particular Christian relations to death to the fore. When are life-saving measures urgent? When are they not? We argue that for Christians, death resists being categorized as an event horizon, there is always more to come, and yet at the same time, particular possibilities for salvation are threatened by the prospect of death in ways that compel people working in church-based recovery programs to act.

Co-author(s): China Scherz

The Worse-than-dead event horizon

Despite growing recognition that certain health states can be considered worse than death itself, most healthcare resource allocation frameworks treat death as an absolute boundary—an event horizon beyond which nothing is calculated or considered. As life-extending treatments proliferate, leaving more individuals in these potentially worse-than-dead states (SWD), such conditions remain speculative entities: acknowledged in theory but systematically excluded from healthcare planning, financing, and bureaucratic frameworks.

Drawing on ethnographic research conducted at a prominent U.S. health economics research center, this presentation examines why death has become the definitive event horizon in Quality-Adjusted Life Years (QALYs), the globally dominant cost-effectiveness analysis methodology. While QALY assessments ask respondents to evaluate health states along a continuum from "perfect health" to the worst imaginable condition, only a small fraction of studies account for SWD as their lowest category—effectively reinforcing death as the predominant conceptual boundary.

Economists explain this paradox by pointing to differences in how people imagine health states. "Perfect health" is relatively easy to conceive because it is often framed as the absence of illness or impairment. In contrast, SWD resists a universal definition. I thus show how the desire for methodological simplicity in economics plays a key role in the constitution of SWD as beyond the event-horizon

Death's Gravity, Affective Taint and the Contorted Epistemologies of Suffering in
Thailand

In the early 2000s, globalizing religious palliative care ideologies combined with Thai spiritual movements to teach individuals to face death and thereby accept the ultimate reality of human life. In the 2010s, many members of this movement began to disavow it, claiming that the overemphasis on facing death had led them to ignore suffering, and that opioid pain medications needed to be liberalized and incorporated into end-of-life care. The terms of this shift revealed underlying Thai and global imaginations of death as brimming with inspiration and truth, and pain as morally insidious, ready to spill out of its temporal bounds and affectively taint caregivers and dying individuals alike. Out of this conflict, in the late 2010s, cancer emerged as a site of détente between poles, an entity so egregious and bound to an imagined risk of death that it could be treated with impunity. In this paper, I propose that the seemingly stark pendulum swing from facing death to relieving pain, and the ultimate use of cancer as a unifying trope rely on incommensurable imaginative horizons available for thinking both death and pain, and that this incommensurability continues to haunt practices surrounding both death and suffering-filled life.

2383 Religious Anthropologists and the Ghosts of Secular Modernity: Reflections on Spirituality and Religiosity in Ethnographic Practice

Start Date: 11/21/2025 2:30 PM **through** 11/21/2025 4:00 PM

Venue: Marriott **Room:** MGB - Salon C

Type: Roundtable/Town Hall

Despite anthropology's long tradition of questioning the fundamental assumptions of secular modernity and positivist science, not to mention the discipline's history of self-reflection and critique, relatively little has been said about the ways the personal spiritual and religious lives of anthropologists intersect with their scholarship. This roundtable asks whether that lack of discussion might stem from sources that we like to imagine the discipline has moved beyond - the positivist binary between subjective experience and objective science and the secularist insistence that personal religious experience be kept from public view. The roundtable seeks to interrogate those assumptions and their ongoing role in the discipline by inviting personal reflections on how religious and spiritual experiences have affected anthropologists in their discipline as well as how anthropology has informed its practitioners religious and spiritual experiences. It also invites historical reflections on the religious experiences of our disciplinary ancestors, for religious anthropologists are not a new phenomenon. For example, E.E. Evans-Pritchard and Edith and Victor Turner all famously experienced Christian conversions well into their careers in anthropology. Talal Asad and Saba Mahmood's personal relationships with Islam were foundational to their work, and Mary Douglas was a lifelong, practicing Catholic. In considering both personal and historical perspectives, the roundtable asks not only what it means to be a religious anthropologist, but also how anthropology might be positioned as a fundamentally spiritual tradition. Drawing on backgrounds and experiences in the Afro-Cuban Lucumí tradition, Catholicism, Charismatic Christianity, Hmong Shamanism, Islam, and Mormonism, panelists will consider questions including: How does anthropology invite religious and spiritual experience? How might we make

sense of transcendent religious experiences that occur during fieldwork? How do our personal religious commitments affect our relationships with our interlocutors, whether they are in our own faith tradition or outside it? How, if at all, do religious commitments affect the fieldwork experience differently from other kinds of commitments anthropologists carry with them to the field? How is our religiosity and spirituality taken up by colleagues in anthropology and by the academy more broadly? What are the stakes for anthropology in considering the religious experiences of anthropologists? In approaching this conversation, panelists are invited to consider following recent efforts (e.g. from Joel Robbins and Khaled Furani) to put anthropological theory in conversation with theology, broadly defined, and following Bruno Latour in "talking religiously."

7561 Exposures and Their Bodies: Part 2, Multispecies Entanglements and the Ecologies of Harm

Start Date: 11/21/2025 2:30 PM **through** 11/21/2025 4:00 PM

Venue: Marriott **Room:** MGB Salon D

Type: Oral Presentation Session

Studies of exposure have brought attention to the fragile and entangled relations of bodies and environments. From toxic chemicals to changing climates, exposure challenges notions of bodies and selves as separable from the worlds in which they work, play, eat, and breathe in. This panel builds on conversations on exposure from feminist studies of science and technology and environmental anthropology. These studies have drawn attention to how experiences of exposure are not simple facts but are rather caught up in epistemic struggles that materialize the impacts of exposure on some bodies and not others. They demonstrate ways exposure makes, even as it degrades, bodies and selves, inscribing local and global hierarchies of race, gender, and class in corporeal forms and capacities.

In the second part of this double panel, we focus on how environmental exposures inscribe spectral traces across multispecies landscapes, revealing the lingering presence of past harms in present ecologies. We turn our attention towards exposure's entanglements-towards ecological systems and interspecies configurations of harm and endurance. Contributors examine how exposure operates as both a physical condition and an epistemic event that entangles human and nonhuman bodies through toxicity, sensory disruption, and shifting ecological relations. Case studies span the molecular politics of PFAS contamination in the U.S. Midwest, interspecies ethics in Australian beekeeping, and fungal exposures at planetary temperatures. They also trace the

afterlives of rocket crashes in Kazakhstan and glacial retreat in the Peruvian Andes, highlighting the entwinement of climate, health, and sovereignty. Together, these papers interrogate how exposure configures relations of care, vulnerability, and resistance across species lines.

- How do nonhuman and more-than-human bodies register environmental exposure?
- What sensory, aesthetic, or affective modes emerge in shared ecologies of harm?
- How might multispecies perspectives challenge dominant paradigms of environmental management and risk?
- What spectral or lingering effects of exposure haunt more-than-human environments and interspecies relations?

Presentation(s): Contested Thresholds of PFAS Contamination and Ecological Impairment

Exposure to per- and poly-fluoroalkyl substances, or PFAS, is unavoidable. Different PFAS chemicals are widely used in consumer products, and PFAS have been released into the environment through industrial emissions and other activities. Some are so pervasive that they are detectable in drinking water, rain, snow, soil, plants, fish, and humans around the world. In the face of such planetary-scale pollution from a toxic chemical, the creation of exposure thresholds – an official level at which an exposure is considered harmful – has become a contested political arena. The notion of an exposure threshold is premised on the logic of "assimilative capacity," the assumption that a body, such as a body of water, a human body, or even the Earth as a bounded planetary system, can absorb a certain amount of something before harm occurs. This paper unpacks the idea of thresholds and draws on ethnographic research among contaminated communities in Wisconsin to explore how victims of contamination make sense of their exposure through stories of toxic injury and ecological impairment across human and nonhuman bodies, including themselves, their pets, wildlife, and waterbodies. Victims of contamination challenge the creation of thresholds as a simple line between "unpolluted" and "polluted" that stops at the human body. Instead, they articulate lived experiences of toxic injury and ecological disablement to illuminate the interconnected reality of chemical embodiment in today's world.

Presenter(s): Thomas Pearson

Fluid interventions: Glacier retreat, malnutrition, and blood loss in the Peruvian Andes

Glacier retreat and recurrent drought are shifting the lived experience of humans, animals, and landscapes in highland Peru. Global climate change has altered hydrological profiles and seasonal rainfall patterns throughout the Andes, leading to lower moisture levels in grassland ecosystems and less edible biomass for alpacas, sheep, and llamas. While herders struggle to feed hungry animals and landscapes, they have also become targets of malnutrition campaigns, like that of the Peruvian Ministry of Health, which pledged in 2017 to reduce anemia rates by half within four years. Anemia and malnutrition have emerged, often interchangeably, as focal points through which bodies and environments are evaluated, managed, and contested. Nutritional interventions aim to manage body-environment interactions within culturally situated understandings of the boundaries of entanglement and exposure. For example, while anemia programs often mobilize racialized anxieties around food and landscapes deemed "marginal" and thus requiring biotechnical intervention, a competing Quechua category, *pisiyawar* (lack of blood), draws attention to the entangled fates of drying landscapes, hungry animals, and ailing humans, and suggests a more widespread fluvial reparation. This paper explores the incommensurability of these conditions and the differing renderings of bodies, substances, and the permeability that connects them.

Presenter(s): Allison Caine

After the Crash: Toxic Exposures and the Struggle for Environmental Justice in the Shadow of Baikonur Spaceport

This paper explores how Kazakhstani communities living under rocket trajectories launched from Baikonur Spaceport, Russia's main gateway to space, articulate environmental marginalisation through embodied experiences of toxic exposure. Drawing on ethnographic research in the village of Karbyshevka—affected by the 1999 crash of a highly toxic Proton rocket—I examine how my interlocutors forge connections between their bodily ailments, environmental degradation, and broader political landscapes.

In the absence of official recognition or scientific proof linking rocket fuel exposures to specific health outcomes, villagers articulate environmental harm through embodied experience—mapping contamination through resonances in their own bodies and surrounding environment. As they witness premature deaths, cancer clusters, and livestock die-offs occurring alongside changes in the environment, they develop sophisticated interpretive frameworks that counter official dismissals of their health concerns. This embodied knowledge allows exposed individuals to challenge state denial and make space for political claims grounded in the experience of exposure. At the same time, by linking bodily suffering to territorial sovereignty, affected communities contest the sacrificial geographies imposed on Kazakhstan and engage in the struggle for environmental justice on the fringes of the Russian space industry.

Presenter(s): Makar Tereshin

Interspecies Exposure and the Ethics of Care in Australian Beekeeping

Insect industries are increasingly shaped by intersecting environmental and biosecurity crises. In Australia, recent varroa mite outbreaks and climate events have transformed beekeeping,

generating new relationships between human and insect bodies, and between technical expertise and embodied practice. This paper draws on ethnographic research with beekeepers to examine how exposure—to parasites, chemicals, and environmental volatility—reconfigures multispecies care, responsibility, and resilience in the Australian honey bee industry. Through fieldwork at hives and association meetings, I explore how biosecurity protocols and scientific innovations translate into everyday action. Beekeepers are not passive recipients of policy, but key interpreters of risk, adapting practices in conversation with ecological conditions and institutional demands. At the same time, bees are subject to competing regimes of care and control—as agricultural allies, economic actors, and vulnerable species. Hives, in this context, become infrastructures of interdependence—sites where regulatory frameworks, ecological precarity, and care practices are materially negotiated. This paper argues that exposure operates not only as a condition of vulnerability but as a framework through which multispecies relations become actionable. By analyzing how care is negotiated across species and scales, it contributes to conversations in environmental anthropology on technoscience and ethics amid crisis.

Toxic Mould at Two Degrees: Exposure, Ethics, Interventions

Around the world, the risk of exposure to potentially pathogenic species of fungi is creating new hotspots for planetary health, attracting the attention of environmental and biological scientists, as well as activists and entrepreneurs. Whilst other members of the fungi kingdom (mushrooms and yeasts) have received attention from the multispecies and microbial turn across the social sciences and humanities, there has been little interest in other environmentally ubiquitous fungi: moulds. Moulds differ from other fungi in several biological respects but—in the context of rising global temperatures—it is their capacity to tolerate heat that makes them uniquely concerning.

This paper draws on comparative research with biological scientists, chemists, and public health specialists working to address the impacts of climate change on exposure to toxic mould. In high-income countries like Scotland, exposure maps onto patterns of income and health inequality as much as damp and humidity. In low-income countries like Rwanda, the lack of surveillance and diagnosis systems means exposure represents an unknown health burden.

Efforts to address toxic mould offer a chance to rethink human-nonhuman relations at late capitalist temperatures—above 1.5°C. Making mould visible also reveals longstanding global health inequalities and multi-morbidities, and draws attention to the material politics of exposure—linking people, buildings, and fungicides used in food, homes, and hospitals.

5505 Panel 2 - Habitable Air: Urban Inequality in the Time of Climate Change

Start Date: 11/21/2025 2:30 PM **through** 11/21/2025 4:00 PM

Venue: Marriott **Room:** MGB Salon E

Type: Oral Presentation Session

This panel examines how urban communities, living on the margins of interconnected energy hubs, manage the sociocultural and health effects of chemical air pollution. A secondary focus explores how longstanding struggles over industrial toxicity are newly being shaped as climate science becomes increasingly integral to contemporary governance. The panelists, all contributors to the forthcoming edited volume *Habitable Air: Urban Inequality in the Time of Climate Change*, draw on qualitative methods - including ethnographic participant observation and historical archival research - applied at a scale typically reserved for quantitative climate studies. The panelists work within a clear network of scientists, policymakers, workers, and residents across transnational sites. Each panelist investigates the practices and interactions of ordinary people as they grapple with energy industries that are at the center of their lives and with community debates about their health and that of the planet. By studying these networked practices and interactions as key drivers for reordering urban life and politics, we may be better able to dismantle homogenized perspectives on transboundary air pollution to build more equitable and sustainable cities.

Presentation(s): Atmospheres of Hazard: Different Socio-Technical Ways of Knowing Airborne Risks in North China

This paper, focusing on an energy hub of North China, examines different socio-technical modes of knowing atmospheres of hazard. Exploring residents' use of the Air Quality Index, mobile phone apps, collecting medical evidence, and relying on somatic symptoms, the paper tracks how bodies, lives, and populations become entangled with atmospheric risks. The paper argues that as citizens engage in networks of ecological redress around hazardous atmospheres, their political and personal stakes in environmental governance fracture shared visions of local and global energy futures.

Presenter(s): Charlotte Bruckermann

"Cheap" Life: Asthma and the Passing of a Refinery in Durban, South Africa

In May 2024, the state-owned Central Energy Fund (CEF) bought a flooded and inoperable oil refinery in Durban, South Africa, for 1 rand (or 5 cents in \$US). The purchase was meant to mark a new era of environmental struggle between the state and citizens in response to emerging forms of "energy transition" in South Africa, an ostensible move away from fossil fuels and toward less-carbon intensive alternatives. By focusing on asthma symptoms among local residents living near to the refinery, this paper examines public discussions about the "cheap" refinery and "cheap life" in the petrochemical hub of Durban at a time when demands for energy justice and Pan-African social ownership are taking hold.

Presenter(s): Stefan Ogedengbe

Air Pollution without Human Lungs: Lignite Mining and "Geopolitics" against Geopolitics in Germany

This paper unpacks issues of air pollution and geopolitics in Germany's Rhineland region, where vast open-pit mines supply power plants and energy generation. Lussem analyzes how, in this "hotspot of energy transition," diverse critical civil society actors try to localize problems associated with global climate change in the context of national coal exit policies. This contribution focuses on how these actors frame air pollution as a question of the unequal distribution of planetary habitability between generations. The paper ends with a brief reflection on the return of "classical" geopolitics in the sense of accounting for "Earth" as a political actor.

Presenter(s): Felix Lussem

Prospectors: Power and Pollution in South Lebanon's Artisanal Crypto Mines

Amidst Lebanon's worsening economic crisis, the paper focuses on South Lebanon as a hotspot for small-scale, artisanal cryptocurrency mining due to its availability of Litani River hydropower. The chapter delves into economic opportunities created for some and new demands on an aging fleet of dams and the rural communities that rely on them. Discussing how miners navigate a complex and dynamic terrain, the paper investigates how this geography of digital extraction exposes the changing relationships between rural communities and the state, as energy infrastructure itself becomes a newly contested site of accumulation.

3802 Making biosocial collaboration happen: beyond co-option, extractivism and ventriloquism

Start Date: 11/21/2025 2:30 PM **through** 11/21/2025 4:00 PM

Venue: Marriott **Room:** Regent

Type: Roundtable/Town Hall

Calls for biosocial collaboration are increasing where problem-based wicked problems and challenges reveal the limits of disciplinary silos. These silos continue to be intractable features of collaborative work shaped by wider ecologies of funding and institutional infrastructure. Despite these challenges, researchers continue to collaborate in biosocial projects albeit in non-linear and uneven ways across divergent national and institutional contexts. Navigating this terrain for both anthropologists and their collaborators can be both rewarding and disorientating. Historically embedded epistemological differences tend to surface, often destabilising researchers own disciplinary theory and methods. Yet this disorientation can also facilitate reorientation to a problem as collaboration pulls those engaged in this work beyond their familiar safe bounds and bounces them back to reshape working practices within their 'home' discipline. Trust between researchers is key to these collaborations, yet building and stabilising sufficient trust for these collaborations to unfold is painstaking work and not without its complications. Given the power and infrastructures that support biomedical and scientific institutional contexts more generally, there is a high potential for social science practice to be co-opted or subsumed. While this remains an ever present possibility, anthropologists have paid less attention to the situated experiences of collaborators engaged with us in our interdisciplinary research. How can we foreground their voices, reflections and experiences of doing this work in ways that become relevant to creating and sustaining interdisciplinarity and not simply extracted as resource or data point for our research? How can we ensure that the perspective of our collaborators is not ventriloquised through our own more readily accessed reflexive engagement in biosocial work?

Building on and extending the dialogues that took place in 2023 AAA Roundtable 'Navigating Enclosure, Explosion and Implosion: Pathways to biosocial synthesis' and a forthcoming Vital Topics forum in *American Anthropologist*, in this roundtable we place our collaborators experiences alongside and in dialogue with our own anthropological reflections. Each roundtable participant will be asked to creatively facilitate a contribution to the roundtable where their biosocial collaborator(s) is/are 'present' (e.g. using excerpts of film, audio, interviews or discussion or other creative intervention) and are asked to reflect, alongside and with their partner, on the work of biosocial collaboration and the challenges/opportunities it facilitates for their research. By bringing our collaborators voices and reflections to the table we aim to expand the possibilities and parameters for doing biosocial research in times where the work of biosocial interdisciplinarity continues to remain fragile, requiring constant sustenance and care.

8757 NAPA Professional Development Workshop: Fundamentals of AI

Start Date: 11/21/2025 2:30 PM **through** 11/21/2025 4:00 PM

Venue: Marriott **Room:** Riverview 1 (41st Fl)

Type: Workshop

If you're new to using AI tools but want to learn more, this workshop will provide the fundamental knowledge to help you understand the range of current AI capabilities and how to start using them. We will differentiate between automation, machine learning, natural language processing and generative AI, as well as the difference between open source and closed source models. You'll learn how to discern which tasks are appropriate for AI applications and pick the appropriate tool for those tasks. We'll practice creating prompts and experiment with querying an open source model while learning how to protect your information and reduce bias. Please bring a laptop or tablet. This workshop is not intended for those more experienced in AI use and will not involve coding.

2946 Doubles and Troubles

Start Date: 11/21/2025 2:30 PM **through** 11/21/2025 4:00 PM

Venue: Marriott **Room:** Studio 10

Type: Oral Presentation Session

Doubles seem to be enjoying a pop cultural renaissance around the world, from literature and theater to film and television, to the vast world of digital not-you-yous: sort-of reproductions, spin-offs, avatars, mirrors, shades, and "uncanny twins" – all rooted in the meaning of the term doppelgänger, "double goers," who do not merely appear but also act, sometimes destructively. We coexist with many 2d versions of ourselves – negative images or partial reflections of who we think we are – which circulate on screens and social media, acquiring their own trajectories and agendas beyond our control even as they carry our desires and fears beyond our fleshy bodies. These doubles include enhanced selves, whether by filters or surgery; augmented and virtual reality selves; genotypes; legal and political aliases; deep fakes in which we find disturbingly real-passing clones; and so-called data doubles: data voodoo dolls representing the aggregation of users' complete digital history. Consider the digital doppelganger that more accurately predicts an individual's behavior than their conscious mind, or chatbots that undetectably enhance a spouse's text or a colleague's emails. Ravetto-Biagioli offers the concept of the "digital uncanny" to describe our experience of encountering our own increasingly robotic nature in these digital traces. The uncanniness of this experience exacerbates the difficulty of developing a critique or defense, at the same time as it opens an arena for creatively interrogating the ethical and political stakes of doubling ourselves "in real life," in performative genres such as ritual, theater, and film.

Why are doubles suddenly populating (or over-populating) our worlds? And is their appearance really so sudden? At stake in their proliferation are more deeply rooted psychical and social tensions around identity and its repletion: tensions between multiplicity and coherence, fluidity and durability, continuity and rupture. Doubles regularly upset distinctions between real and fake, true and false, authentic and fabricated. These tensions and reversals are not new, though they are

assuming new digital and material forms of expression that demand rethinking and retheorizing. Participants in this panel will explore a variety of doubles, attempting to move beyond the experience of the uncanny to develop methods of contextualization and critique across locales: verbatim theater in New York and virtual reality dance performance in Florence; satirical identity play in the work of a Danish documentary filmmaker; mirroring in large language models and social media; and sobrenombres (sobriquets) used by cartel members and crooked cops in northern Mexico. If we take this constellation of doubles seriously, we might gain clarity on how and why doubles are haunting our everyday lives, and how we might repurpose them as means to our own ends.

Presentation(s): Reality Doppelgangers: Doubling in Verbatim Documentary Theater and Virtual Reality Dance Performance

Tina Satter's (2019) "Is This a Room" stages a verbatim transcript of a government contractor's arrest. Promotions promised that "every cough and snuffle" was faithfully enacted. In Lucas Hnath's (2019) "Dana H." the audience hears the story of a kidnapped psychiatrist literally in her own voice: the on-stage actor mouths the psychiatrist's pre-recorded vocal narrative. This paper examines how and why these theatrical doubles are positioned in between performance and real life. Delving further, I turn to a stage in another part of the world: a Florentine choreographing real-time dance by sending signals inside her dancers' Virtual Reality headsets. Florentine dancers are mimicking hidden virtual avatars, while New York actors ventriloquize voices. American theaters and Florentine stages seem to be doing what performance, broadly speaking, excels: extracting a deeply unconscious and historically emergent feeling and embodying it before the eyes of an audience. How do these verbatim documentary theater plays and virtual reality dance performances depend on both doubling and something tied to real life? Why do these multiples share a body, or part of one? This paper attends carefully to three key parts of these extraordinary performances: the body, whether multiplied, shared, virtual, or duplicated; temporality, whether synchronous or delayed; and reality, the way doubles are tethered to a virtual or empirical reality. I aim to uncover why these doubles are tethered to the re

Unfacts are Fun Facts: Body Doubles and Identity Play in Documentary Film

This paper explores body doubles as instruments of political critique whose efficacy lies in the complex pleasures attending the onto-epistemological problems of identity, identification, and consensus reality they raise for viewers. I take as a case study the work of Mads Brügger, a Danish

investigative journalist who has made a series of documentary films addressing political corruption, repression, and secrecy in locales from the US to North Korea to Central African Republic. In these films, Brügger engages in a practice of "identity play," often captured with secret cameras hidden on his person. The identities he plays with are not only investigative tools used to "get the truth from people," as he has put it, but also fantasies viewers might have of themselves. His doubles thus raise questions about identity, and propel processes of identification, that open audiences to a reflexive reassessment of their political positions and commitments – and therein lies their efficacy as critique, by contrast with practices of debunking deep fakes and conspiracy theories (for example). I closely examine Brügger's most recent film project, in which men who have served in reality as the body doubles of political leaders convene to interact "in character" on film. Any identity play is a form of impersonation, offering the player's body as a site and a tool of deception, but the symbolic capital of thereness in nationalist ideology raises, or changes, the stakes of play when it is per

False Idols: Aliases and the Doubling of the Law in Northern Mexico

This paper draws upon 15 months of ethnographic research in Northern Mexico to examine the common use of sobrenombres, or aliases, among cartel members and corrupt public authorities involved in forced disappearance and related crimes. Sobrenombres, I contend, enable these figures to shield themselves from repercussions for criminal acts; yet they help these same individuals gain power through the cultivation of infamous reputations, as rumors of impunity enjoyed by, say, La Sombra [The Shadow] circulate. Through this act of doubling, they present themselves as figures who remake or transcend the law. Following Bhrigupati Singh's (2012) prompt to consider how attention to the "lower strata of deified life" might nuance critical theory's uptake of political theology, I examine similarities between power possessed by rogue cops and criminals, and the divine power of uncanonized saints, who are often known only by sobrenombres, and who enjoy robust devotional cults in Mexican Catholicism. Even as they shelter doubts about rumored records of violent crime, many devotees evince a willingness to suspend judgment, glorifying would-be saints in the name of miracles granted. Likewise, Mexican cynicism toward the judicial system prescribes that victims appeal through personal connection or bribe to powerful individuals, or hire a lawyer willing to bend rules. As one criminal prosecutor explained to me, in Mexico the law is "doubled"—different in theory and practice—and "one has to know

3467 Specters of Authoritarian Anti/Environmentalisms - Part II

Start Date: 11/21/2025 2:30 PM **through** 11/21/2025 4:00 PM

Venue: Marriott **Room:** Studio 2

Type: Oral Presentation Session

This panel seeks to take stock of the global wave of authoritarian politics that has gathered strength

over the last two decades with the intensification of neoliberal capitalism, the waging of the wars on terror and drugs, the rise of digital surveillance, the regressive redistribution of wealth, and accelerating resource extraction amidst growing greenhouse gas emissions. This has spurred some sociopolitical forces to embrace different modes of authoritarianism predicated on corporate freedoms, ultra-nationalism, the militarized defense of borders, theocratic patriotism, the enlisting of self-defense as a legal shield to justify the use of violence (both for individuals and countries), and the unleashing of state and non-state forces of repression to secure domestic resources, ensure the sovereignty of national natures, and to stake out geopolitical claims on foreign resources.

Some far-right regimes have condemned climate activism, sustainability, and environmental justice as propaganda pushed by partisan zealots. The rise of anti-environmentalism has become a point of commonality across some authoritarian movements as they seek to undermine socio-environmental rights, roll back environmental regulations and laws, and destroy the expertise of public agencies dedicated to environmental and climate science. In the process, some protected areas are subject to de-gazettement, downsizing, or fragmentation. Biodiversity protections are weakened. Meanwhile, fossil fuels industries can continue with business as usual despite the push for global decarbonization and the pivot toward green capitalism. Fears of stranded assets can be attenuated, at least for a time.

Anti-environmentalist political agendas, however, run into the realities of constitutional orders, entrenched capitalist markets, and sociopolitical forces aligned with environmental protection, modes of care, and advocacy. The need to build political coalitions in government means that anti-environmentalist agendas might be understood alongside new forms of authoritarian environmentalisms that emerge in practice. These may draw upon the legacies of colonialist environmentalisms or advance neoliberal environmentalisms in unexpected directions. These efforts might apply hyper-nationalist politics to conceptions of protected nature through attempts to evict actors, groups, and communities perceived as enemy forces 'polluting' to national lands. Or they might attempt to strip away biodiversity protections while enlisting pro-environmentalist language to justify these measures. Environmental NGOs might become willing collaborators with these state agencies and corporate partners. These currents of authoritarian environmentalisms can further harness or even spur 'late fascist' environmentalisms.

Presentation(s): The Range: A Political Ecology of Texan (Il)liberalism

Why did Jeff Bezos and Elon Musk move their operations to Texas? The easy answer is to avoid paying taxes, but Texas' property regime, where 95% of land is privately owned, also affords these billionaires space and time for technoscientific and environmental experimentation without oversight. I take Texas, a place often seen as the epicenter of anti-environmentalism in the United States, to be a laboratory for extreme political forms. From it, and based on ethnographic research with environmental scientists who repeatedly tried and failed to access Bezos and Musk's land to conduct ecological surveys, my work theorizes Texas' political ecology as the range. I take the range to be a material and fantasy space, a logic of property invested in policing who gets to live where and how, and a testing ground for old and new forms of capital accumulation. It exists at the intersection of the borderlands, the settler colonial frontier, and the plantation. The mythos of the range is contingent on an attachment to the environment that is suffused with an extreme libertarian ethos: one that exists in this paradoxical space carved out by liberal desire for new and better technologies of place making and an illiberal commitment to its violent policing. I use my ethnographic investigation of the range and its arrangements, those made on the ground between governments, businesses, and environmentalists, to historicize the environmental authoritarianism embedded in Texas' property regime.

Presenter(s): Emma Pask

Of Owls, Cowboys, and Disappearing Fish: Anti-Regulatory Common Sense in the American West

This paper examines conflicts over endangered species protections in the American West. Federal regulation of species protections has defined debates over who and what properly belongs in the West and what they can do there, as protections have come into conflict with the expansion of logging, mining, farming, and hydroelectric power. Opponents of these protections frequently question the very terms of the debate, citing the need to protect property rights to land, water, businesses, and homes as particular versions of the American way of life come under threat due to species protections. These arguments often ground their critique in the notion of common sense. The paper draws on archival work and fieldwork on endangered species protections to examine the production of anti-regulatory common sense. It analyzes the alignments of anti-regulatory common sense with divergent modes of contestation and environmental care, as the question of who and what is endangered comes to shape the broader political landscape.

Presenter(s): Meghan Morris

Korean Whaling: The Ghost of Colonialism?

In this case study I inquire if the diminishing influence of U.S. and European opposition to whaling at the worldwide level could enable a return to whaling as it was practiced during South Korea's authoritarian era. The Ulsan Whale Festival is a cultural event to express local citizens' demand to continue whaling as their livelihood. Initially the festival promoted the tradition of whale meat consumption, but the national government's support required the organizers to change their message, in compliance with the international moratorium on commercial whaling. However, the decree of conservation status for whale species already on the verge of extinction merely rehearses

the conservation practices from 100 years ago, when Korea was under the colonial regime of the Japanese Empire. Furthermore, the promotion of whale-friendly and ocean-friendly messages at the festival occurs in tandem with a mostly invisible and quasi-legal trade in whale meat. Coexistence of conspicuous signs of whale protection with invisible exploitation of whales illustrates the entanglement of local cultural policies with the conservation imperatives of the international environmental movement. However, a shift in environmental policy under the Trump administration will open space for major changes in Korean marine conservation policy. I conclude by arguing that the Ulsan Whale Festival is likely to serve as a cultural vehicle to generate political support to reinstate the Korean whaling industry.

Presenter(s): Bradley Tatar

“Recycling Done Right”: On the Techno-Politics of Efficiency in Corporate-State Environmentalism and the Dispossession of Discards

Speaking out against the Extended Producer Responsibility for Packaging (EPRP) policies recently enacted in the US might seem contrary to environmentalist concern. EPRP—which requires producers to pay for the end of life management of packaging and, theoretically, provides an economic incentive to reduce waste—has gained considerable momentum in recent years. But the activist's warning illustrates a growing concern about how emerging corporate-state alliances in support of circular economy policies have generated "environmental rule" predicated on state-sponsored corporate freedom. Here, contemporary environmental policies evoke old specters of waste reduction in the name of efficiency. The petro-plastics-packaging industry has promised to deliver more efficient systems, or "recycling done right". However, in practice, these promises have enclosed the value of discards and dispossessed people who have long practiced environmentalism by salvaging that value. Further, corporate polluters have leveraged increasingly authoritarian tendencies in right-leaning US states to secure state-level protections for highly controversial "chemical" or "advanced" plastics recycling technologies that can technically meet the requirements of producer responsibility, but bypass the contamination concerns and rights of fence-line communities. These observations invite engagements with theory that links the techno-politics of waste with increasingly authoritarian projects of environmental rule.

Presenter(s): Cindy Isenhour

Biomass and the Promise of Harm

When the European Union committed to climate neutrality by 2050, they effectively invented an industry known as "biomass" - the felling of forests for fuel under the erroneous argument that, since trees grow back, it is carbon neutral. The greening of Europe would be accomplished by widespread environmental devastation elsewhere. What has happened, however, is a bit surprising; through public subsidies that finance well over 100% of operating costs, private companies such as Drax have successfully taken to destroying the coniferous forests of the American southeast. In only a few years, dozens of facilities emerged to process forests into fuel for export, leaving small rural communities further impoverished, deafened by noise pollution, and struggling to breathe. In

California, however, Drax has taken up a new position. This paper explores a proposed biomass plant in Tuolumne County, a low-income (and relatively conservative) rural county that rolls from the Sierra Nevada foothills to mid-range mountains just north of Yosemite. The Stop Drax campaign provides an ethnographic entry point into how environmental narratives get repurposed in the interests of capital. I show how a community is promised a reduction in wildfire risk in exchange for the health and environmental harms of indiscriminate logging. As concerns about fire become rhetorical tools, the Stop Drax campaign provides insight into how capital exposes us to harm, and systematically promises to reduce it.

Presenter(s): Whitney Russell

Labored Confidence: Authoritarian Affect and Exhaustion in Varanasi, India

This paper examines how authoritarian environmentalisms cultivate what I term "labored confidence" – an affective state characterized by the iterative work of asserting faith in their "modernizing" projects despite pervasive moods and experiences otherwise. Drawn from ethnographic fieldwork in Varanasi, I trace discourses surrounding the recent construction of a multimodal shipping port in the city that lies largely defunct because of the diminished capacities of the river Ganga to service it. Despite this, the government has floated plans for its expansion, creating widespread anxiety in residents of nearby villages whose lands will be acquired in the process. This situation exemplifies a broader dynamic in Varanasi, a sacred city for Hindu religiosity, where discourses of urban development and environmental stewardship are deeply intertwined with the rise of Hindu nationalism and its vision to reshape the city and its relationship with the Ganga. I argue that "labored confidence" arises from tensions between the state's insistence on progress, the felt experiences of uncertainty, ambiguity, and deferred resolution amongst affected residents, and the exhausted but assumed productivity of the Ganga. This analysis contributes to understanding the affective dimensions of authoritarian environmentalisms, throwing particular light on the development of individual and collective subjectivities in late industrial times.

4516 Sites of Extraction, Scenes of Experimentation, Histories of Resistance: Development as Horror

Start Date: 11/21/2025 2:30 PM **through** 11/21/2025 4:00 PM

Venue: Marriott **Room:** Studio 3

Type: Oral Presentation Session

This panel explores the living consequences of extractive imaginaries-how people inhabit and endure projects that frame their territories, bodies, and futures as sites to be tested, transformed, and controlled. From Amazonia and the Caribbean to post-socialist and Balkan landscapes, we examine how geographies and lives are turned into laboratories-testing grounds for policies,

markets, techno-scientific interventions, and development dreams. These are spaces haunted by colonial and imperial desires, techno-bureaucratic fantasies, western scientific dissection, and ambitions of progress that refuse to die. We bring together ethnographic, historical, and discursive analyses to consider how laboratory logics are reproduced, contested, and lived with across distinct yet resonant settings. In Amazonia, we examine how the region continues to be framed by the neocolonial gaze as a site of intervention, erasing local histories and sideline Amazonian epistemologies. On the Greek island of Astypalaia, we explore how sustainability transitions are semiotically laminated onto "island-laboratory" discourses, reinscribing colonial tropes of testing and transformation under the banner of climate action. In Colombia, the use of DDT in malaria eradication campaigns and agricultural modernization reveals how science, disease, and agribusiness co-produced chemically haunted landscapes under developmentalist regimes. And in post-socialist/post-Soviet Eastern Europe, we follow women displaced by war and repression as they reassemble fragments of a collapsed order into vernacular archives of memory and survival-refusing disappearance through place-making practices grounded in material and affective continuity. Together, these papers ask: What happens when life itself becomes the object of experimentation, surveillance, and imposed transformation? How do people live with, make sense of, or unsettle the unsettling? And in what ways do these geographies function as sacrifice zones—spaces and subjects rendered disposable in the service of distant fantasies of order and development? By foregrounding the lived experiences of those who inhabit these zones, this panel challenges sanitized narratives of innovation and progress, insisting instead on the messiness, violence, and resistance that accompany experimental governance in the name of the future.

Presentation(s): Refusing the Lab Lenses: On the Experimental Fantasies Projected onto Amazônia

This paper critiques the long-standing tendency to frame Amazonia as a laboratory—a site of experimentation for scientific models, conservation strategies, and anthropological theory. From colonial and neocolonial projects to climate politics, Amazônia has been repeatedly constructed as a space of radical alterity (exotic, pristine, and ready for intervention), ecological urgency, and future-making. These imaginaries—often rooted in technoscientific authority, developmentalist desire, and extractive logic—have sought to turn the region into a testing ground for global projects, frequently under the guise of development. Drawing on political ecology, decolonial critique, and Amazonian scholarship, this paper offers a literature-based analysis of how neocolonial framings of Amazônia have circulated across disciplines and policy arenas. I examine how these imaginary

erases local histories and obscures the violence of imposed transformation. Rather than accepting Amazônia as a zone of intervention, I argue for an approach attuned to its political and historical complexity—what Amazonian thinkers have called Amazonidade: a lived condition shaped by plurality, bleeding colonial scars, and resistance. Refusing the lab means refusing the fantasy of external mastery—and insisting on other ways of knowing, living, and relating that have endured, transformed, and resisted through time.

Presenter(s): Adriana Abreu

An Island of Sustainable Experimentation: Island-Laboratory Discourses in/around Astypalaia

Many Astypalaiaans, like many people growing concerned with climate change, have been talking about sustainability for a while now. However, the implementation of the Smart and Sustainable Island's (SSI) sustainable development project is recontextualizing orientations to Astypalaia's past, present, and future. In addition to instilling new modes of electric mobility on the island, the SSI project has also brought new sustainability discourses into circulation in/around Astypalaia. In some instances, the SSI project's sponsors, including Volkswagen and the Greek government, articulate the island as a "test site," a "laboratory" for experimenting with smart and sustainable mobility. How are such experimental fantasies of sustainable transition linguistically and semiotically laminated to island-laboratory discourses? This paper examines such language use that positions the island as research lab, ripe for sustainability-oriented experimentation. These "island-laboratory" discourses pertaining to Astypalaia are analyzed through combining considerations of intertextuality, language ideologies, and political ecology. This paper demonstrates the layered process of linguistically situating Astypalaia as a test site. More broadly, the following examines the specters and consequences of previous conceptualizations of islands as sites of experimentation that haunt the present articulations of Astypalaia as such.

Presenter(s): Nikolina Zenovic

Vernacular Archives of Order: Post Socialist/Post soviet women's Place-Making through Objects and Memory in Exile

In the Western imagination, the collapse of the Soviet Union marked the definitive failure of a political experiment. Yet for those living its aftermath, the collapse was never complete. Its fragments endure in the objects people carry and the stories they tell. This paper explores how Ukrainian and Belarusian women refugees in Poland-fleeing the full-scale Russian invasion and escalating repression under Lukashenko-navigate these layered histories through material assemblages of meaning. Drawing on my fieldwork, I illustrate the processes of selecting objects during rapid displacement. I argue that these selections index a particular habitus of what I call vernacular archives of order: everyday practices of sorting, storing, and organizing objects, memories, and spaces to reweave continuity in exile. Through the lens of visual anthropology, I trace how these women transform remnants of a broken world into scaffolding for new life. Visual methods allow me to recover textures-the settings, gestures, and silences, that written accounts alone might miss, revealing how material culture becomes a living conversation with disrupted

ordinariness. Rather than framing nostalgia as simple longing, I draw on Svetlana Boym's notion of the off-modern to argue that nostalgia emerges from histories of rupture and incomplete transitions. In this context, memory becomes a method of survival, an ongoing negotiation with the unfinished promises of both socialism and western liberalism.

“Poisonous miracle”: DDT and mosquito control in Colombia, 1959-1979.

Although the molecule had been around since the 19th century, dichloro-diphenyl-trichloroethane, or DDT, became popular worldwide after World War II because of its effectiveness against many arthropod species. In the 1950s, the pesticide was utilized in malaria eradication campaigns based on mosquito control. At the same time, DDT was fundamental in what Colin Duncan calls the chemicalization of agriculture as part of the Green Revolution in Latin America. This dual purpose intertwined the old concern for urban hygiene with the developmentalist discourses that characterized those decades in the region. Little was known about the side effects of DDT that would become increasingly visible in bodies and ecologies over the next two decades. Drawing on primary and secondary sources, this presentation reflects on mosquito control policies and practices for malaria eradication in Colombia between 1959 and 1979, decades in which DDT was extensively employed, to study the links between mosquito management and the production of rural and urban spaces. I rely on Leigh Johnson's concept of accumulation by degradation to explore, from a geography and political economy perspective, the links between science, disease, agribusiness, and the city, in the production of mosquito haunted landscapes in Colombia.

4539 “The Child as Material, Spectral, and Engaged: New Anthropological Methodologies in Childhood and Youth Research”

Start Date: 11/21/2025 2:30 PM **through** 11/21/2025 4:00 PM

Venue: Marriott **Room:** Studio 4

Type: Roundtable/Town Hall

[SPONSORED BY ACYIG]

Anthropological understandings of children's and youths' bodies and cultures are affected by ghosts of our academic past – for example, our reliance on traditional methods like participant observation, sensory explorations, and "being there." At the same time, the specter of the present shifts our methodological approaches with global social forces and new technologies intersecting and influencing young people's lives. Our Roundtable discusses new research that captures how contemporary young people interpret their lives both materially and spectrally: their bodies, virtual presence, social media selves, and expressions of identity. Helfrecht uses her research with Sidama children in Ethiopia and adolescents in Alabama to assert the need to reassess how we traditionally measure and mark children's physical development-heights, weights, teeth, etc. -and

explores how social factors such as mobility and dietary diversity can be incorporated into such measurements; Morelli uses "ethnographic animation" that brings together ethnographic techniques with animated films written and coproduced by young people in the Amazon to better understand their lives; Chapman describes participatory and visual-material methods as a way for children under Japanese state care to create life story narratives; Spray examines the creation of comic books as a useful methodology based on her research with young people in New Zealand, Ireland, and the US; Shaw uses music (both through the activity of listening as well as interpreting song lyrics) to "listen creatively" and learn about young Filipinx lives in Canada; and Leggett delves into American girls' curated Instagram pages as indicators of their virtual imagined communities. This Roundtable features anthropologists of childhood and youth who demonstrate these methodological ghosts, hauntings, and mergings of the traditional with the contemporary, all while working creatively to think with (rather than simply about) young people in the apparition of a changing world. Through this discussion we explore how research methods with young people have the potential to reflect worldly hauntings of the body as a transnational palimpsest of beliefs and experience. We also consider how creatively working with memories and imagination can reveal ghosts, shadows, or projections of the past and future.

2673 Towards a Decolonial Ethnography: Building Power through Co-Authorship with Indigenous Collaborators

Start Date: 11/21/2025 2:30 PM **through** 11/21/2025 4:00 PM

Venue: Marriott **Room:** Studio 6

Type: Oral Presentation Session

The history of Anthropology has been a strife with extractive practices, from material remains to stories and viewpoints. In response to Faye Harrison's call to decolonize anthropology, there have been strides forward in the way we teach, show up in communities, methods used in the field, and publication. This panel explores the methodology of co-authoring with community counterparts. Papers will discuss the importance of authorship as a means of decolonizing the field. Additionally, papers explore the methodological nuance of how co-authorship is operationalized when working across locations, languages, and temporal timelines.

Presentation(s): Levers of Power: navigating co-authorship, solo authorship, and tenure within anthropology

The discipline of anthropology and the method of ethnography have long held three fixations, "danger, isolation, and intimacy" (Hanson and Richards 2019). Tales of roughing it "in the field," living alone, risking safety, all to better understand and know the subject of research. This produces the belief that researchers work alone, without help, connection, or input from anyone "in the field." These fixations then reappear on the publishing end with the fixation on solo-author publishing. Unfortunately, for purposes of retention, promotion, advancement, and tenure within anthropology, the solo authored publication is highly coveted and highly rewarded with many institutions valuing the solo-authored piece above all else. This fixation and desire require junior faculty to reproduce and manufacture this sleight-of-hand of lone-wolf researcher and writer to maintain job status or move from the insecure postdoctoral, teaching track, or non-tenured position to the more secured tenure position. This paper grapples with what it means to be junior faculty committed to co-authorship and decolonization practices, but existing in a discipline where materially that is often not valued and, in some instances, not recognized.

Olosho Ethnobotany Project: The importance of co-publishing results within a Maasai community-based project

The Olosho Ethnobotany project was launched in the summer of 2017. This project was in response to a community request to document traditional medicinal plants in a written format for the Purko Maasai community in Narok, Kenya. To date, our team has collected descriptions and samples of thirty-two local medicinal plants. The data collected was analyzed and disseminated locally in the first and second editions of a local field guide, *Olosho Ethnobotany Project—Medicinal Plants of the Purko Maasai*. After the local dissemination of the field guides was complete, we focused on peer-reviewed publications. This presentation will discuss the process and importance of co-authoring publications. To date, we have two peer-reviewed publications and one book chapter. We will explore the operational details and challenges of co-publishing across locations, languages, and timelines.

When Methods Hurt: Embracing the Ethics of Relational Inquiry

Drawing from Pacific Research Methodologies (PRM), this paper explores how relationality—rather than collaboration—is foundational in ethical research with Pacific communities. Pacific epistemologies challenge conventional notions of collaboration as a panacea for extractive research, suggesting that decolonization involves recognizing the complexities of relational obligations and embracing incommensurability in knowledge production. Based on our ethnographic research on diabetes complications in Samoa, in this paper, we take up the call to be encumbered (Uperesa 2016)—not just in the abstract sense of being aware of anthropology's colonial history, but in the practical sense of being accountable to the relationships, histories, and responsibilities that shape our research. Ultimately, we argue that knowledge creation in Pacific contexts is not about harmonizing diverse viewpoints but navigating tensions in ways that respect Indigenous ontologies and empower Pacific voices. Through relational practices, we seek to understand diabetes complications but also to care for our own research relations, showing how relationality can transform both the methods and ethics of anthropological inquiry.

Learning to Listen: Dialogues with Mayor Alfonso in his Journey to Recapture the Links between Amazonian Life and Time through Ecological Calendars

Mayor Alfonso knew he had to embark on a research journey around Amazonian ecological calendars when we visited a community in the Primavera reservation in the Caquetá River, a fiduciary of the Amazon River. Since then, an interdisciplinary group of indigenous and non-indigenous scholars in different stages of our careers have been learning about the malleability and complexities of the interdependencies of the life cycles in the Amazon Forest. We have learned that these ecological calendars operate as portals that provide access to the understanding of the entangled teachings and relationships among animals, humans, plants, rain and sun, rivers and forests, and ancestors. They speak about seasons, rituals, preparations, and work across beings through the always changing time. In a similar way, our learning journey has proven to be malleable, nonlinear, and multiple. We have established pedagogical dialogues in which Mayor Alfonso has patiently explained to us key aspects of the calendars and how these are windows to the plural, complex and circular notions of indigenous time and space. Similarly, as the weaving of time occurs, our learning process resembles the shape of a basket that is patiently weaved by various people.

Collaborative Authoring, Developmental Editorship, and Other Apparitions of Decolonized Authority

Can the muse of ontology somehow be brought closer to the science of inter-cultural collaboration? Or does "speculative knowledge-production" represent the best that

anthropologically trained, 4-field social scientists can achieve? In this panel, we consider the disciplinary practice of invisibilizing or interpreting voices that still lies behind most anthropological work and consider whether, how, and why they might be made more visible. First, we consider ontological anthropology's "concern is in the generation of an alternative analytics rather than an understanding indigenous life and practices per se". This part leads to an exposition of the corporate-academic enterprise: its exchange in English, impact factors, and tenure dossiers. Second, we consider the foreign view (of so many Latin American scholars) that scientific methods harnessed by community members with their own expertise can do more to protect Indigenous ontologies (or communities, or lands) than philosopher-anthropologists from another tradition. Is our scientific mediation crucial? Or is Alcida Rita Ramos' critique of the perspectival approach as, simply, 'essentialist' and 'exoticizing' true? We close with reflections on what alternatives to mediation (philosophical or otherwise) have been tried over the past 100 years of anthropology, and what kinds of new ones are needed like revisions to the CRediT and ICMJE standards.

2394 The Ghosts of Analyses Past

Start Date: 11/21/2025 2:30 PM **through** 11/21/2025 4:00 PM

Venue: Marriott **Room:** Studio 7

Type: Oral Presentation Session

From fieldnotes to field journals to dissertation chapters to articles, lectures and books, the analytic activity of ethnographic work and writing unfolds over long periods of time, during which large scale political economic shifts and our own biographical transitions from student to the precariat and beyond (ideally!) may occur. Ethnographic moments and nuggets of analyses often fade more and more into the/our past. That weight can haunt: so many years later, what did it mean then? Or, so many years later, what does it mean now that it meant that, then? How do analytic ghosts, the specters of our past analyses, haunt us? They can indeed inspire: a moment becoming historic can enable new perspectives on meanings then and now. They can also paralyze: the synapses created through repeated previous analysis can be hard to break, and the zombies of good ethnography can be hard to escape. This panel invites participants to reflect on the long timelines of anthropological work through the figure of the ghost. The papers reflect on the work of bringing analyses past into the present and how it intersects with life course, the timelines of an academic job and its modes of knowledge production, as well as larger historic and ideological shifts.

Presentation(s): Political Disorientation

What structure of feelings are attached to the indeterminacies of meaning endemic to democratic action? How do political actors ground claims in shifting ideological terrains to which they are always catching up? This paper proposes political disorientation as a key mode of contemporary political praxis. Distinct from what social theorists describe as left melancholia—the inability to let go of passed revolutionary horizons—disorientation is felt not as stuckness in the past but as out-of-syncness with the present. Activist ethnography is doubly disorienting as we untangle the "present" of fieldwork from the "present" of writing.

Brazil's "June Days" protests in 2013 are often interpreted as such a disorienting event. These protests exposed the rifts between leftwing politicians and social movements allied in Brazil's "pink wave" (2003-2013) and were retrospectively interpreted as the inauguration of the "long Brazilian crisis" (2013-2018). This conjunctural jolt disrupted the aspirations of LGBT+ activists with whom I conducted fieldwork from 2011 to March 2013 and shifted the genre of my ethnography from a critical appraisal of human rights to the genealogy of a culture war. This paper names disorientation as the way I related with interlocutors between fieldwork and writing. Our shared agnosticism of the present, I argue, shaped the epistemological and ethical contours of this project.

Zombie liberal genomics: what is science in Trump's America?

Under the twin liberal-democratic goals of advancing knowledge and furthering the economy, life science and biomedicine emerged over the past four decades in US industry, academia, and taxpayer funded research. The paradigmatic life science, genomics, is both liberal, in the sense that it entails democratic values like equality and strives for such things as inclusivity, and neoliberal, in the sense that it entails specific contemporary and locatable varieties of economic relations (Reardon, Sunder Rajan). But US liberal democracy (no matter how fantastical it has always been) is waning, alongside tenets of neoliberal economies. Funding for major projects of this paradigm, centering on genome and brain, is under threat. In ethnographic perspective, my technoscientific field-sites are becoming more historical every day, and the analytic of liberal genomics, vis-à-vis (or at times against) which I wrote, now has a blatant outside, from where it haunts my writing. What becomes of liberal genomics, and the science it epitomizes, in an authoritarian US regime? And how does one grapple with proliferating historicity in "the field," this field's pivotal moments, and our own ways to read such moments?

Leaving the field, haunted by sickness: on the privilege of health in anthropology

In November 2019, I left a suitcase at the Kabira Hotel in Kampala, Uganda's capital city. In the suitcase is field equipment: recorders, notebooks, long skirts and sandals. For the previous two years I had been traveling between the Kabira and Columbia's Mailman School of Public Health regularly enough to have developed some conviviality with the hotel staff, and they gladly accepted my suitcase. And then. Covid-19 happened. My family grew. Like many anthropologists', my research agenda shifted. My fieldwork got "patchy." I turned to fieldsites online and closer to home, closer to me. But I think about that suitcase often. I know from another researcher that as of 2023 it was still at the Kabira. Along with my recorders and files and travel adapters, the suitcase also contains insulin pump supplies, syringes, an extra glucometer, and some now-expired, rapid-acting insulin. This equipment was as unobtainable in my former fieldsite as it was necessary for my fieldwork. But it was impossible to list on itemized budgets for grantmakers and university accounting offices, part of a regime of invisibility around chronic illnesses ethnographers carry into their fields. This paper takes up this regime of invisibilization as anthropology's "privilege of health." Tacking between world events, life course unfolding, and research trajectory, I will consider forms of knowledge foreclosed by disciplinary orientation toward health.

Presenter(s): Erin Moore

Haunting Debts

Doing research in Cuba, a seemingly dynamic economic landscape with spiraling inflation, wildly fluctuating exchange rates, multiple currencies, and erratic geopolitics with the United States, I have grappled with pinpointing and fixing "the current context," as well as preventing the empirical material from being construed as outdated. Repeatedly updating or making research "current," however, assumes the researcher is able to continuously travel and have access to their field site, access that, in my case, became limited due to a variety of circumstances. Instead, I pivoted to other analytical possibilities and found it productive to trace broader historical economic arrangements and debt relations that haunt and culminate in considerations of the contemporary Cuban economic experience. Suturing diverse economic histories of debt—from cancelling odious debts to the Spanish colonial administration, to the neocolonial republic's debts of gratitude to the United States, to debts owed for property nationalized by the Castro government—enabled new interpretations of how Cubans have confronted economic crises in the past decade. In this paper, I argue that moving past the impulse to constantly incorporate "currentness" permits a theoretical recasting through archival inquiry into the specters of debt and their spatio-temporal linkages within which economic relations in Cuba are indeed embedded and better understood.

Memories of Fidel and the Ethics of "Tough Girl" Ethnography

Do you know that photo of Che Guevara? Scruffy beard, tilted beret, intense eyes. It haunts me. Or of Fidel Castro? Olive green garb, beard, and the same intense gaze. It haunts me, too. Same with the one of Camilo Cienfuegos. Lesser known but also an instrumental Cuban revolutionary figure. I still see these photos cascading behind the plain-clothed young man sitting at an ancient desktop

computer in the inner offices of the Ministry of the Interior in Havana, Cuba in the summer of 2011. That scene spelled to me, at that time, disaster. The end of my research. Bolstered by Guevara, Castro, and Cienfuegos, that young man – and his uniformed counterparts beside him – told me to stop what I was doing. So, I stopped. Three-quarters of the way through my PhD. It was a true crisis in a graduate student career, and this ethnographic moment has continued to haunt me. But not because it ended my career as an anthropologist, but because, in many ways, it bolstered it, providing fodder for speaking engagements, book chapters, articles, and conference presentations. In this paper, I explore the ethical and methodological questions that arise from using such harrowing experiences for career advancement. What standards does it set? In what ways does it promote a "tough girl/guy" mode of ethnographic research that is uncomfortably reminiscent of other anthropological ghosts? How should anthropologists think about these moments in ways that can still teach but not flex?

Presenter(s): Lee Cabatingan

Signs of Law?

As I write a book about the relation of legal aid and capitalism in Mae Sot, Thailand, long-removed signs of law -- on billboards, posters and advertisements -- haunt my thinking. This is because, when I did fieldwork, on and off from 2009-2014, signs about the procedures related to the legalization of migrant workers abounded, on shopfronts, billboards and municipal buildings. I read the prominence of those signs as iconic of the legal structures I sought to analyze. Ten years later, those signs are no longer there yet lawyers with whom I worked report that the legal dynamics pertaining to migrant workers are largely unchanged. This paper grapples with the question of how meaningful those signs of law were, and what it means that a past analysis relied so heavily on them. If a certain arrangement of law, capitalism and sovereignty perdures in Mae Sot, how can the ethnographer know which materializations of that arrangement are analytically significant? Following Derrida (1993), I explore how these signs, while no longer present, might nevertheless be specters both in Mae Sot and in this ethnographer's understanding of it.

6869 Ghosts, Coloniality, and Promise in Black Movement Legacies

Start Date: 11/21/2025 2:30 PM **through** 11/21/2025 4:00 PM

Venue: Marriott **Room:** Studio 8

Type: Conversation/Debate

The ghosts of Black histories emerging from slavery and colonialism continue to echo in the present. However, they do not speak only through ongoing modes of racialized oppression and violence. These ghosts also dance: twining through Black expressive culture and forms of liberatory joy. This session explores how the ghosts of global Black history emerge through what Celina de Sá describes as both "coloniality and promise," as capoeiristas in West Africa use expressive movement and imagination to simultaneously embrace the history of coloniality and refuse its

burdens. In conversation with de Sá's brand-new ethnography of capoeira in Senegal and The Gambia, this panel asks how a careful attention to joy, artistry, and the liberatory potential of movement might enable a different reading of global blackness and diaspora. While Black history is often narrated through ruins and loss, how does coloniality and its ghosts also incite liberatory forms of joy, friendship, and community? While the "African diaspora" is most often understood through the wrenching histories of successive displacements, what does it mean to talk about diaspora on the African continent, and therefore, without displacement? Finally, drawing these connections in New Orleans—a crucial site in the history of Black performance—what might these alternative readings of Black history show us about how to confront our troubled present?

7255 Haunted Timelines: The Afterlives of Images in Fragile Digital Worlds.

Start Date: 11/21/2025 2:30 PM **through** 11/21/2025 4:00 PM

Venue: Marriott **Room:** Studio 9

Type: Oral Presentation Session

Images haunt us. They move through time and space, outliving their original contexts, reappearing in new places, reframed with new meanings, and activated for varying political, social, and affective ends. In the 19th and 20th centuries, photography was seen by many as a magical enterprise. Yet, the prospect of endless mechanical reproduction raised fears of a drained aura and diminished authenticity. This tension intensifies in today's age of digital image-making, where reproduction and circulation are not only limitless but actively desired, fueling expectations of permanence and the capacity to reach vast audiences. As links rot and interfaces refresh, digital images circulate as ghosts, their afterlives suggesting they are not static representations, but social agents with temporal, spatial, and affective trajectories.

Our panel interrogates these afterlives of images as they manifest in varied geopolitical contexts—from the Americas to South Asia. We trace the production and movement of images across circuits of political meaning-making, sites of ecological grief, archives of collective memory, and mechanisms of value accumulation all while navigating digital fragility. How do we cope with the affective impacts of the temporality and volatility of the visual in our virtual worlds (Schull 2018)? How do these "demanding images" (Strassler, 2020)—which insist on ethical engagement, compel audiences to bear witness, and refuse to be relegated to passive representations—operate as contested sites of memory and political struggle?

Through ethnographic approaches, we reflect on how different publics emerge from and engage with shared digital experiences. Our inquiries examine: How do communities navigate the tension between the algorithmic logics that shape image circulation under neoliberal digital economies and the enduring promise of digital spaces as arenas for political struggle and collective resistance?

How does digital surveillance, algorithmic removal, and content erasure impact the temporality of political imagery and their life cycles (Azoulay 2008; Sontag 2003)? When images detach from their origins and enter meme pools, how do communities challenge the dispersal of meaning and reassert control through technological tools, creative interventions, or memory practices (Russel, 2024)?

Our presenters address these questions focusing on the themes of permanence, loss, and memory, and on the dynamic afterlives of images as agents of political, social, and affective change.

Presentation(s): *Paste, Post, Paint: Images as Battlegrounds of Collective Memory and Political Imagination in Brazil*

This paper examines how images of resistance circulate across physical and digital terrains in Brazil, haunting the present with unresolved pasts and speculative futures. I focus on the recurring visual pairing of Marielle Franco and Carlos Marighella—two Black political figures assassinated decades apart. These images, I argue, are not passive symbols but demanding images (Strassler, 2020)—agents that insist on ethical engagement, reconfigure political imaginaries, and blur temporal boundaries.

Through ethnographic tracing of a wheatpaste mural on Avenida Paulista and its digital afterlives on Instagram, I read this pairing as a heterochronic image-event unfolding across multiple temporal and spatial scales. I explore how acts of walking and scrolling through São Paulo and social media platforms reactivate memory, unsettle linear Western time, and expose algorithmic erasures. By

reanimating Black leadership and historical struggle, the Marielle-Marighella juxtaposition creates a visual counter-memory to the "present past" staged by the far right.

This paper shows how collective memory is contested in fragments—through street walls and social media timelines, defacement, and re-posting—where political images live on, disappear, and return. In these haunted circulations, resistance is not only remembered but reimagined, forming new chronotopes where history and futurity collapse into acts of visual insurgency.

Ecological Death on the Internet and the Afterlife of Visual Protest

In 2022, flooding displaced 33 million people in Pakistan, placing the country at the climate crisis' forefront. As the government legitimated its claim to climate reparation through international diplomacy, local activists - living in the most impacted areas - advocated for ecological protection by visually documenting the unfolding crisis. Working with these activists, I examine how those most affected imagine a visual language that legitimates their plight. How do they navigate the fragility, temporality and changing infrastructures [Schull 2018] of the digital spaces where they archive the death of their ecological worlds?

Amid media blackouts, these activists feel pressure to create image-events [Strassler, 2020], leveraging digital circulation and its affective textual feedback to prompt coverage by broadcast media. Mapping the virality of images captured during the 2022 floods, I follow them into their afterlives. What becomes of them once the crisis they visibilize loses the internet's attention? How do their quality, framing and texture [Steyerl, 2009] influence where they live on in the virtual world, how they shape memory, and who decides to revisit them? How do the producing communities make sense of internet's precarity [Kneese, 2022] as a site for grieving and legitimating ecological crisis and loss? Underlying these inquiries is an interest in digital inequities underlying movement building and the shifting stakes of who gets to use the internet as archive.

Presenter(s): Aiman Rizvi

Materiality Troll: NFTs and the Failure to Keep Digital Images

When Kevin McCoy invented the NFT in 2014, his goal was simple: as a new media artist who had exhibited in elite art institutions, he hoped to create a mechanism that would allow digital art creators to sell their work to collectors skeptical about the archivability, provenance, and permanence of digital images. The digital or the virtual are often framed as not-real, inauthentic, constituted by copies rather than originals, "prosthetic, synthetic, pseudo, wannabe, adulterated, ersatz, and many other words besides" (Kockleman 2017).

How did the NFT community hope to "fix" this ugly duckling status of digital images using blockchain technology before it got overtaken by "bad actors"? Why did they fail?

Focusing on the "right-click save" troll, which was popular in 2021, I argue that the NFT community lacked the authority to create a semiotic encounter with digital images as valuable objects. The

"right click save" troll involved responding to Tweets of NFT owners in which they proudly displayed a new purchase of a digital image with the same digital image- screenshotted or downloaded- indexing that digital images cannot be owned as they cannot be kept back from circulation and lack a legible "original" (Benjamin). This paper asks how anthropological theories of value and materiality (Weiner 1992, Graeber 2015, Keane 2005) can be adjusted to address how the specificities of digital materiality - especially transparency and ephemerality - are socially managed and contested.

Presenter(s): Shanti Escalante

The Ghosts of Deleted Archives:

In Kashmir, where military control extends into digital spaces, images don't simply exist or disappear—they live, die, and haunt. This research examines the lifecycle of political imagery under intensive digital surveillance, where documentation of protests, human rights violations, and everyday resistance face algorithmic removal. Drawing on ethnographic work with journalists, activists and civilians, I analyze how such systematic erasure generates what Derrida (1994) terms "hauntology"—a presence-in-absence that structures political discourse and memory.

Through autoethnographic reflection on my disappeared photo documentation of political graffiti, alongside accounts from others facing similar erasures, I trace how these absences become forms of presence. When images of military presence or resistance are removed, they transform rather than vanish. The void left by deletion becomes a site of meaning-making, as communities develop practices to recall and sustain the political significance of censored content without reproducing it.

These practices reveal how surveillance creates distinctive temporalities of political imagery (Azoulay 2008; Barthes 2000; Sontag 2003), where disappearance often marks the beginning-not the end-of its political efficacy. By examining these spectral circulations, this paper explores the tensions between algorithmic governance and visual memory, revealing images may exert their greatest political force precisely as they become ghosts.

Presenter(s): Insha Bint Bashir

Haunted Democracy: Tracing Dictatorship's Afterlives in Feminist Claim-Making during a Right-Wing Government (Buenos Aires, Argentina)

In contemporary Argentina, the civic-military dictatorship (1976–1983) haunts a precarious democratic present. This paper examines how Ni Una Menos, a key feminist collective, mobilizes the signifiers dictatorship and democracy in its visual claim-making under the current far-right government. I analyze the collective's Instagram feed—from Milei's inauguration in December 2023, to June 2025—as a fragile digital archive and a lieu de mémoire (Nora, 1998) for ongoing feminist struggles.

Ni Una Menos's feed showcases a diverse visual repertoire - protest flyers, photographs, video clips, and screenshots of tweets and news headlines- where dictatorship and democracy emerge not as fixed historical markers but as fluid and mobilized signifiers, linking past state violence to

current democratic erosion, feminist resistance, and contested futures. While Instagram's linear design structures the feed chronologically, its associative visual logic foregrounds temporal entanglements, blurring boundaries between past and present.

This paper contributes to understanding how Argentina's last dictatorship operates as an image-event (Strassler, 2020) reactivated in contemporary feminist discourse, and how digital feminist archives reframe memory through visual practice. Finally, I propose a methodological approach for interpreting Instagram feeds as dynamic, affectively charged archives shaped by platform logics, political urgency, and meandering feminist temporalities.

4982 Anthropologies of Occulted Play: Through Play Genres and into Playing

Start Date: 11/21/2025 2:30 PM **through** 11/21/2025 4:00 PM

Venue: Sheraton **Room:** Edgewood AB (4th fl)

Type: Oral Presentation Session

"Play" is both a powerful means of social expression and an expansive cultural signifier for other social phenomena. The meaning of play has historically been cloaked by several "rhetorics" (Sutton-Smith, 1997) that have sought to capture its essence by emphasizing its evolutionary or developmental function at both the phylogenetic and ontogenetic level, its capacity to materialize the chaotic and unpredictable dimension of existence or vice versa to harness conflict and reveal players their powers, its potential to bring together people and offer a commentary over their collective life and identity, and its power to reimagine and remake the world anew or to mock, unsettle or subvert its order. But play is also more than the use we make of it as a metaphor for something else: "not a figure of speech, not a trope, not a metaphor; play is at first a kind of biological, prelinguistic enactment with its own claims on human existence, no matter how metaphorized it is in other claims" (Sutton-Smith, 1997, p. 143).

This panel invites an anthropological reflection upon both these dimensions of play: about play genres – "efforts to contain, enslave, tame, use, and colonize playing" – and about playing – "the ongoing, underlying process of off-balancing, loosening, bending, twisting, reconfiguring, and transforming-the permeating, eruptive/disruptive energy and mood below, behind, and to the sides of focused attention" (Schechner, 1988/1993, p. 43). Across these two dimensions, we tease out the occulted relationships between play as a panhuman imperative and other fundamental axes of the human condition.

We begin with Myrdene Anderson and Katja Pettinen's exploration of play as a dynamic semiotic metacommunicative system, which challenges the boundaries between "real" and "digital" and encourages a more complex understanding of play as a continuum punctuated by shifts in embodiment and sensoriality. Next up, Kyle Bikowski's work sheds light on the generative value of play beyond the digital/actual divide by retracing the pervasiveness of the play mode in the life of "Gaymers" (gay-gamers) communities in Mexico. Seth Sagstetter hones in on the explorational character of playing in Tabletop Roleplaying games (TTRPG) and highlights the potential for emotional consultation, elaboration, and catharsis that await players at the interface between

reality and fantasy. Attending to the ethical pragmatics of playing "modified games" in Physical Education leads Adriano De Francesco to rethink the way games can provide avenues for perceiving and constructing contextually significant others, beyond the modern functionalist rhetoric of play as a site of moral development. Finally, Nicholas Mizer brings us to the terrain of praxis and activism by conceptualizing games as technologies that can foster collaboration with human and more-than-human beings and actualize important changes in collective forms of life.

Presentation(s): The Rhythm and Structure of Play

We explore embodied and sensorial dimensions of play, attending to how spatiotemporal contexts shape how play unfolds through movement, gesture, voice, and proximity—by affordances of the context and sometimes by objects. Play is co-orchestrated by space itself, with bodies in reciprocal engagement with their surroundings and each other. As dynamic metacommunication, play shifts toward greater abduction with increased variability and unpredictability. As play structure becomes more predictable—with greater poles of induction and deduction—temporal rhythms also shift. Tactile embodied movements require a real-time sensorial interaction, like dance that can only occur within a rhythm, not outside it.

We trace a continuum from open, spatially-mediated play toward increasingly structured contexts, culminating in digital situations with disembodied interaction filtered through screens. What becomes of play when touch and olfaction are absent and vision limited to pixels? How does the absence of physical co-presence reshape engagement? Rather than offering a binary between "real" and "virtual" play, we reflect on how shifts in embodiment and sensoriality both enable and constrain play. Individual autotelic play can also be centered on non-tactile dimensions (via imagination), or on synesthetic sensorial exploration (via object shapes and surfaces). We foreground how play—as embodied interpretive practice—intersects with broader questions of personhood and species Umwelt.

Gayming Beyond Games: Play as a Foundational Component to Community Building Among Gaymers in Mexico

Research into the lives of gay men frequently focuses on stories of victimization, disease, or the bedroom, overlooking the multi-faceted lives gay men lead. This work focuses on Gaymers, who build their identities around their love of video games, providing an opportunity to study the joy also present in gay men's lives. Currently, queer video games studies has focused on digital spaces or on the content of games rather than players, often recapitulating the same narrative of victimization. Doing so hides a foundational aspect of Gaymer identity: Gaymers do not stop playing when the video games are switched off.

Following ethnographic research in Querétaro, Mexico and WhatsApp groups, this study reveals that play permeates nearly every group interaction among Gaymers. These interactions range from sharing memes which construct and define group masculinities, to role-playing as "Señora Católica" [Catholic Lady] during gossip sessions, to wordplay pushing back at linguistic imperialism. As in person play among Gaymers happens apart from, alongside, and between virtual spaces, it challenges the idea of a digital/actual divide. Similarly, Gaymer interactions often fit into Caillouis' categories of games, while being performed outside of Huizinga's "Magic Circle," which separates play from "real" life. By moving beyond the surface level of Gaymer play through video games, the hidden role of play as foundational in Gaymer community construction and maintenance is brought to light.

Presenter(s): Kyle Bikowski

Catharsis in the Wild: Confronting and Clarifying Emotion in Tabletop Roleplaying Games

Emerging from my work with Tabletop Roleplaying game (TTRPG) communities in North America, I explore the cathartic potential of play as a clarifying force in which participants engage and negotiate negative life experiences. In the course of TTRPGs as a form of structured, ritualized play, players enter into a state of quasi immersion, referred to as "enthralment" (Stromberg 2001) and "distance" (Scheff 2007). Enthralled, players detach from the immediate reality outside of the game, absorbed in a collective experience. When players achieve a balanced distance, they remain grounded in reality yet immersed into the character acting before them. Donning character masks, TTRPG players place constructed character proxies into compromising situations which mirror life experience - anger, grief, and dissolution. By engaging fantastic unrealities, players are able to more safely confront disturbing emotional states. In TTRPGs confrontations take the form of improvised roleplay, chosen character traits, or challenging villainous beings. In confronting tense in-game scenes or defeating manifestations of evil, they confront real emotional afflictions. I return to the cathartic process first laid out by Aristotle in Poetics, a catharsis not bound to clinical oversight, but found in the wild, in playful exposure to relatable fantasy.

Presenter(s): Seth Sagstetter

Unpacking Moral Development: Toward a Processual Approach to the Ordinary Ethics of Play and Games

Over the last two decades, the anthropology of ethics has complicated pre-existing models of the formation of the "moral subject" by rejecting both the structuralist reduction of morality to a matter

of social rules and the individualist conception of "ethical agency" as a "quality internal to the subject" (Laidlaw, 2023, p. 12). Still, more research is wanted to address the fundamental question of "How do we become the kind of complex reflective subjects who can enter into all these diverse forms of self-cultivation" (Mattingly & McKearney, 2023, p. 572). This paper takes a step in that direction. Based on my ethnographic fieldwork at a New Zealand high school, I analyze how the games played by students during Physical Education constitute an interface between the interactants and the ordinarily ethical.

According to psychology and pedagogy, play and games are crucial mediums for children's development of an autonomous capacity for moral judgment. But is there a more complex, more "processual" (Keane & Lempert, 2023) pragmatics of engaging ethics via the "play mode" (Schwartzman, 2024), lying beyond the modern functionalist rhetoric of play as a site of moral development? If games are avenues for perceiving and constructing contextually significant others, what skills do they actually cultivate? Illuminating the relationship between ethics and play through an anthropological lens can bring new insights into the ontology of both these facets of the human condition.

Playful Methods for Collaboratively Imagining Worlds in Albany, New York

In this paper I report on the development and use of playful anthropological methods to guide collaborative research between neighbors, colleagues, and students in Arbor Hill, my neighborhood in Albany, New York. Using a multimodal approach, we have adapted worldbuilding games like Microscope (Robbins 2011) and I'm Sorry Did You Say Street Magic (Asercion 2019) to aid our collective imagination of the present and futures of Arbor Hill. This methodology also guides our collective work to cultivate more playful, more resilient futures for our neighborhood in ways that build on local legacies of resistance and transformation.

This work is based on an application of the Cosmographer's Circle, a model that for playful praxis conceptualizes play as a spirit of autotelic exploration of possibility and games as technologies that enhance our exploration of possible worlds (Mizer 2025). In this context, games allow us to collaborate with other human and more-than-human beings to bring critically important aspects of the virtual into the actual (Germaine 2025).

6963 Law, Governance, Coloniality and Decoloniality in Transnational China

Start Date: 11/21/2025 2:30 PM **through** 11/21/2025 4:00 PM

Venue: Sheraton **Room:** Estherwood (4th fl)

Type: Oral Presentation Session

Contemporary China's sociopolitical governance is haunted by intersecting histories and spectral inheritances: the legacy of socialist legality, entrenched global capitalism, authoritarian rituals, the reflection on international law and its colonial reminiscence, and the endurance of conservative moral orders. As a multiethnic, post-socialist and emerging global power, the national and the local state mediates between these legal lineages. Domestically, the state and grassroots deployment for the rule of law reinterpret and reappropriate liberal frameworks, while localized customary codes, grassroots jurisprudence and indigenous narratives strive to be extending. Internationally, China's legal influence has been expanding through state-led initiatives and the everyday life of formal and informal socioeconomic activities.

This panel explores how coloniality and decoloniality intersect in transnational Chinese legal practices, focusing on both mainland institutions and their diasporic extensions. Situated in the emerging conversations between scholars based in the US, UK and China, panelists will examine the theoretical trajectories and ethnographic engagements of legal anthropology in contemporary China in relation to the paradigmatic power of Western social science in shaping interpretations of custom, legalism and harmony. We also consider efforts to navigate non-Western discourses of legal identities through traditional Chinese legal and political philosophy. Dwelling on historical and sociopolitical complexities, we trace the emergence of legality and legal subjectivities at the nexus of stratified and gendered forms of statecraft, transnational legal norms, indigenous political formations, and bottom-up everyday articulations—from the Belt and Road projects to the legal encounters of ethnic minorities, rural communities and overseas migrant populations navigating the afterlives of Western colonialism.

As China arrives at the crossroads of historical spectres and future-making promises, this panel engages with the critical question of the global circulation of Chinese legal norms and Chinese identities as histories of colonial violence, socialist legality, and neoliberal governance are condensed, contested, and reassembled. Situating Chinese legal anthropology in broader ethnographic engagement on the afterlives of colonialism, we move beyond "rule of law vs. rule by law," and explore the new theoretical insights on governance, state power, and the hauntings of colonial power structures. We ask: what possibilities exist for crafting decolonial alternatives or reconfiguring sovereignty within and beyond the state's borders? By centering native jurisprudence and vernacular legal articulations, the panel positions China as a generative site for reimagining domination and justice through decolonial lenses.

Presentation(s): Custom in Legal Anthropology: Conceptual Genealogy and Interpretive Paradigm

This paper situates customary laws in China from a historical perspective and explores the different manifestations of the meanings and practices of customs in ancient Chinese, Western archives and contemporary legal practices. On the one hand, there is a close relationship between customs, cultural taboos, and formalized laws; meanwhile, the institutionalized legal framework of the state overdetermines the contemporary scholarly understanding of customary laws.

As the concept of custom in Chinese legal anthropology scholarship and methodology has been shaped by notions of "primitivity," "normativity" and "legality", this paper traces the intellectual development in legal research following functionalism, historicism, and normativism of custom, and shows the variety of interpretive paths as well as the incommensurabilities they established for a native, grounded, and scientific understanding of customs in current Chinese legal anthropology field-building. This paper foregrounds situationism as a generative vehicle to overcome the inheritances of both colonial knowledge paradigms and rigid legal formalism. By engaging contemporary legal practices, it explores decolonial possibilities for rethinking customary law beyond the dominant frameworks of state legality and universalist legal rationalities, and toward more locally legible and epistemically pluralistic articulations of justice.

Presenter(s): Shunfeng Liu

Legal Incentives: China's Wisdom in Governing a Mega-State through the Rule of Law

Legal incentives encompass more than mere behavioral control mechanisms: they embody profound governance philosophies. Rooted in China's traditional governance theories and legal thought, the concept of legal incentives is deeply embedded in historical governance structures. This is most vividly captured in the expression "the great affairs of the state lie in rewards and punishments," which reflects a long-standing tradition in Chinese political philosophy. It stands as a treasured element in the intellectual heritage of Chinese legal thought. The system of "rewards" and the underlying philosophy can be seen as a uniquely Chinese contribution to the art of governance and a key to the nation's long-term stability and peace.

In China, the rule of law system is not solely punitive, but also incentive-based. Reform has been central to the development of the legal reward system. Governing through punishment is reactive and passive—addressing problems after they arise. In contrast, governing through rewards represents a proactive and preventive strategy—addressing issues before they occur. Legal incentives, therefore, reflect economic rationality, serve as a means of behavioral guidance, and function both as mechanisms of behavioral reinforcement and as forms of symbolic exchange.

Presenter(s): FEI FENG

Law at Interregnum

In a quote attributed to Gramsci, the imprisoned critic allegedly wrote, "The old world is dying and the new world struggles to be born. Now is the time of monsters." We are living in an interregnum as

suggested by the Chinese political slogan: 东升西降 ("The East is rising and the West is declining"). What is the role of law at interregnum, the period between political orders?

We think of law as having a definite provenance, as tied to the state, but what if interregnum shows that modern law has other genealogies (both past-referential and forward-looking), including empire, globalization, infrastructure, assemblage, and ensemble? In parallel, today, we use categories like "liberal law" and "authoritarian law" and while there may be real-world examples of these, it may also be the case that law, while never fully divorceable from politics, may be detachable from the political systems of which they are a part, that is, law may transcend the political. One result of the foregoing is that, at interregnum—a period of deep flux—law may move between political orders assuming novel forms and trajectories.

This talk will reflect on the nature of law at interregnum with a particular emphasis on what may come next. It draws on ethnographic research conducted over the last six years as part of the "China, Law and Development" project which explores how diverse Chinese actors are affecting international law, transnational law, and the internal orders of non-PRC jurisdictions.

Presenter(s): Matthew Erie

Paradise Recrafted: Intangible Cultural Heritage Law and Ethnic Minority Subjectivity in Contemporary China

The term "intangible cultural heritage," a UNESCO coinage, is deployed in the China Intangible Cultural Heritage Law (ICHL) to refer to a wide variety of non-material cultural properties, defined as "expressions of traditional culture handed down from generation to generation by the different ethnic groups and considered by these groups as part of their heritage." These include oral literature, traditional art forms and performance, and traditional rituals and festivals. The ideological apparatus of institutionalizing intangible cultural heritage both generates confidence for minority writers to proclaim ethnic distinctiveness and imposes creative and ideological limitations on cultural expressions.

This paper discusses how ethnic minority subjectivity in contemporary China is formed through minority writers' and grassroots activists' critical engagement with the ICHL. I show how minority villagers and writers mobilize ICHL through and beyond its legal parameters to create communal ethos and creatively re-invent minority traditions. I engage with an ethnographic and a textual reading of a grassroots cultural publication, A'er Archive, produced under the leadership of a Qiang village leader and collectively authored by A'er Villagers. I also ethnographically examine ethnic Yi writer Duan Haizhen's novel Heavenly Songs, which juxtaposes the Yi mythic time-space with the legal-political pragmatical modernity encountered by its characters amid interethnic interactions.

Presenter(s): Yanshuo Zhang

Legal Southernism: Chinese Law from an African Perspective

Legal Orientalism describes how Western societies—exemplified by the United States—have constructed Chinese law as the Other, thereby reaffirming their own narratives of legality and rule-of-law modernity. It had significant influence in both China and comparative law, and resonates with China's current effort—oscillating between decolonial aspirations and self-Orientalizing tendencies—to "construct an independent knowledge system" for jurisprudence. Yet beyond the China–U.S. binary, beyond the East–West lens, another, more contemporary perspective emerges: a Global South view of Chinese law. In this view, Chinese law takes on three identities: as it is, through the lens of Legal Orientalism, and—still largely missing—from a Global South perspective.

This paper draws on fieldwork conducted at courts in Rwanda and East African judicial cooperation mechanisms. Through the lens of litigation, experts, and communities, it seeks to reconstruct how Chinese law, legal culture, and legal values are perceived and reconstructed in African societies. It seeks to engage with and complicate the following questions: From a Global South perspective, is Chinese law emerging as a new global legal force—or even reshaping legal globalization? What drives the varied interpretations of its triple identity in the African context? And how might China's efforts to exert global legal influence remain committed to decolonial ideals while avoiding the pitfalls of a neo-colonial narrative?

Rights Consciousness, Gendered Citizenship and Socialist Hauntings Amongst Rural Young Women in Northern China

Mounting youth unemployment—worsened by the post-COVID economic downturn—has driven many young Chinese to leave metropolis and return to their rural hometowns. This paper examines how young rural women performing precarious labor in Shandong Province claim citizenship rights, articulate personhood, and imagine empowerment in the search of rural livelihoods. While existing studies often center urban feminist movements, this paper builds on scholarship on rights-conscious individuals who both reinforce and contest state authority highlighting rural women's political and legal consciousness under shifting state policy agenda, precarious labor, and gendered dispossession within families.

Through ethnographic attention to the disjuncture of citizenship claims and the lack of viable social security provisions and women's rights, this paper explores how these women carve out agency and autonomy by tactically navigating work, marriage and reproduction. This paper foregrounds how the afterlives of socialist imagination and nostalgia intersect with gendered narratives of individualism in contemporary China within the broader context of state-led developmental capitalism and gendered labor of rural revitalization. As situated critics, I will show how young women engage with their lived experiences not merely as subjects of precarity under the heteronormative patriarchal nation-state, but as theorists articulating alternative visions for more just, and equitable futures.

4621 Isms, Ists, and Phobias: Navigating How the Past Becomes Prologue

Start Date: 11/21/2025 2:30 PM **through** 11/21/2025 4:00 PM

Venue: Sheraton **Room:** Gallier AB(4th fl)

Type: Roundtable/Town Hall

We propose a roundtable discussion facilitated by community college faculty and administration specializing in Anthropology, Diversity Equity, and Inclusion, English, History, Social Work, and Sociology. Political attacks on academic free speech and freedom have become prevalent in 2025. This discussion will showcase six educators' salient identities (e.g., sexual orientation, race, gender, and sex) and how they navigate difficult conversations in our classrooms and academic service. This session may provide new ideas and best practices as we invite audience participation.

4986 Deities, Monsters, Ghosts, and other Specters of the State.

Start Date: 11/21/2025 2:30 PM **through** 11/21/2025 4:00 PM

Venue: Sheraton **Room:** Grand Ballroom A-C (5th fl)

Type: Oral Presentation Session

What might monsters, wandering deities, or ghosts teach us about state violence? This panel traces how migrant encounters with state violence manifest through spiritual and supernatural understandings or metaphors. Through ethnographic and autoethnographic accounts, including intimate witnessing (Rosas 2023; Behar 1996), this panel examines devotional practices of border crossings along the India-Pakistan border, nocturnal monsters terrorizing Black Istanbulites, and spiritual warfare and ghostly terror along the Mexican-United States borderlands. Together, these papers reveal how monsters, ghosts, and wandering gods and goddesses materialize in spaces where the specters of the state, like police officers, border guards, and immigration agents, enact violence. By centering the so-called "supernatural" as an analytic of state violence, we argue that such metaphors are not only cultural tropes but also epistemic tools from the bottom up that help articulate the trauma and violence of displacement, racial profiling, deportations, and border crossings. We thus show that metaphors hold political weight and potential beyond the poetics of description.

Presentation(s): Monsters Lurk at Night: Black Migrant Life and Policing in Istanbul

In the lead-up to the 2023 local elections, the Turkish government pointedly stopped extending West African migrants' residence permits, aiming to gain votes by drawing on the anti-migrant sentiments of voting Turkish citizens. Soon after the government's claims that police brutality and Black Lives Matter debates are irrelevant, since they "happen over there, in the West," and since "there is no racism in Turkey," this paper tells a different story: focusing on the lived experience of Hassan, a Sierra Leonean man whose residency permit has not been extended, I pay close attention to his narratives around being policed. Likening police officers to monsters that lurk at night, Hassan solidifies the nighttime as a specific temporality in which police identify and deport Black men, after racially profiling them on the street and following them home. I argue that the nocturnal monster metaphor, combined with that of "lurking," provides a reference point through which Black Istanbulites make sense of continually shifting policies that alter their migration statuses, oscillating between belonging and non-belonging, regularity and irregularity. The metaphor also lays bare the contradictions in state claims to the nonexistence of Black racism in Turkey, showing that it constitutes a particularly ambiguous logic around migration. That ambiguity itself lurks, through night and day, configuring and reconfiguring Black migrant lives.

Presenter(s): Alize Arican

Divine Migrations: The Cult of the Mother Goddess in the Indo-Pak Borderlands

A Hindu goddess with a cross-caste following, Hinglaj's chief abode is in Balochistan, today's southwestern Pakistan. She lives in a womb-like, cavernous hill off the Hingol River whose waters wind to meet with the Arabian Sea. Shrines to her abound across the region.

In Charani mythology, Hinglaj is the fallen head of the goddess Sati's dismembered corpse. After Sati was killed, a grief-stricken Shiva carried her body around the universe. As he wandered and danced in rage, Sati's body parts and blood fell in different places - her forehead falling in a cavern near the aforementioned Hingol river. What happens now when devotees of Hinglaj cross the India-Pakistan border?

This paper considers how migrant's possessions and peripatetic movements across the Thar Desert invoke the itineraries of wandering gods and goddesses. The dispersal of the goddess Sati's dismembered body alongside the erection of new Hinglaj shrines speak to how devotion forges a dispersed migrant geography across the Indo-Pak borderlands. Based on long-term fieldwork with Pakistani Hindu migrants in India, I examine the ways that migrants travel with their gods,

constructing temples to familiar deities in new places. In doing so, they thread together devotional landscapes that exceed the seams of national borders. I argue that in contrast to top-down, religious nationalist geographies that emphasize ideological unity, migrants' own sacred geographies emphasize disaggregation and dismemberment.

Presenter(s): Natasha Raheja

La Llorona: fragmented yet haunting memories of childhood border crossings.

This paper recounts the author's lasting terror of his childhood run-in with Mexico's most infamous ghost, the Llorona (the weeping woman). It was late at night on New Year's Day 1987 in San Diego, California's mountainous border terrain, where the Llorona appeared to him and chased after his family. While the legend of the Llorona permeates in Mexican and Chicanx oral and literary traditions (Perez 2008), the author's visceral encounter with the Llorona occurred the same night he became an undocumented child in the United States. During his childhood border crossing, the author mistook "la migra" (the border patrol) with the Mexican folkloric Llorona specter. After all, in the mind of a four-year-old, what other being than the Llorona could induce so much fear in his parents that made them run and hide in the cold, dark, mountainous terrain? Building on Gilberto Rosas' (2023) concept of "The Lloronx," this paper weaves testimonio and intimate witnessing on the struggle to reconcile with fragmented yet haunting memories and stories of childhood border crossings along the Mexican-US Borderlands (Farfán-Santos 2022).

Presenter(s): Manuel Galaviz

Dios es mi abogado (God is my Lawyer): Faith, Mental Health, and Spiritual Warfare with the U.S. Immigration System

Caught between the pressures of punitive U.S. immigration and enforcement policies and the mental anguish and trauma that may result from these, immigrants and their families turn to their faith and spirituality to find comfort and solace. In this paper, I explore the ways in which Latinx mixed-status families rely on faith-based practices like prayer and mandas (vows), dream interpretation, and traditional healing (e.g. limpias) to help them cope with the anxiety and mental health challenges that arise from living in the U.S. with the constant fear of deportation and family separation. Through an examination of people's testimonios from border crossings and family-based visa petitions, I analyze how their legal, mental, and spiritual worlds collide, blurring the boundaries between the physical and the supernatural. For some of these families, navigating laws that attempt to criminalize and punish immigrants for creating a better life for them and their children becomes more than a legal battle, but one of morality and evil forces that only God and their faith can help them withstand.

1148 The New Reproductive Order: a feminist reproductive studies roundtable, Part 1

Start Date: 11/21/2025 2:30 PM **through** 11/21/2025 4:00 PM

Venue: Sheraton **Room:** Grand Ballroom D (5th fl)

Type: Executive Roundtable/Townhall

In 1995, Faye Ginsburg and Rayna Rapp published the landmark anthology *Conceiving the New World Order*, the first major volume to explore the global politics of reproduction from the point of view of both its marginalization within anthropology and related disciplines and its simultaneous centrality to both the social order and political economy. Ginsburg and Rapp's ambition to 'transform traditional anthropological analyses of reproduction and to clarify the importance of making reproduction central to social theory' has succeeded in many ways. Over the past 30 years, the rapid expansion of the anthropology of reproduction has been accompanied by the global spread of the reproductive justice movement, and a new centrality for reproductive politics on the world stage. Increasing concerns about reproduction and fertility now intersect with many of the most important political challenges of our era, including climate change, economic instability, the rise of authoritarian regimes, debate over immigration, battles over national borders, and marginalization of varied minority and LGBTQ+ communities. This double roundtable revisits these themes in the context of the launch at AAA 2025 of a new anthology of ethnographic work on fertility and reproduction edited by Sarah Franklin and Marcia C. Inhorn that builds on the pathbreaking work of Ginsburg and Rapp. *The New Reproductive Order: Technology, Fertility and Social Change around the Globe* argues that despite its new centrality to both politics and scholarship, reproduction and fertility remain haunted by past absences as well as the spectral presence of longstanding stereotypes and misconceptions. In our two-part roundtable we will focus on what has changed and what has stayed the same from the point of view of feminist reproductive studies over the past three decades. What can we learn from the narratives, images and tropes – as well as products, practices and politics – through which reproduction and fertility are organized today about their ongoing significance to social and political life? Using specific examples from detailed case studies around the world, our roundtable participants will reflect on these and related questions at a key turning point in global reproductive politics today. The two co-editors as well as nine contributors to *The New Reproductive Order* will be joined by Rayna Rapp as a final discussant to offer an historic occasion to look back over three decades of feminist reproductive studies at a crucial pivot point for global reproductive politics.

[[Note to Executive Session Reviewers: This proposal and its other half would also work as a single roundtable with extended time if that is a preferable option to a two-parter. In that case, the two co-organisers (Franklin, Inhorn) could act as informal chairs of a session with 8 presenters (Kantsa, Blell, Wahlberg, Gagne, Van de Weil, Rudrappa, Homanen & Whittaker) and two discussants (Bharadwaj & Rapp)].

Organizer: Sarah Franklin, University of Cambridge, Marcia Inhorn, Yale University

Presenter(s): Sarah Franklin, University of Cambridge, Venetia Kantsa, Mwenza Blell, Newcastle University, Ayo Wahlberg, University of Copenhagen, Nana Okura Gagne, Waseda University

Discussant: Aditya Bharadwaj

2718 The Living Dead, the Living Landscape, and Other Nonhuman Agents in the Maya World (Part II)

Start Date: 11/21/2025 2:30 PM **through** 11/21/2025 4:00 PM

Venue: Sheraton **Room:** Grand Ballroom E (5th fl)

Type: Oral Presentation Session

What a western framework often labels as ghosts, apparitions, spirits, and specters inhabit the world with us, but they are called different names by different cultural groups. As such, how these groups relate to them also varies from western imaginings. In the Maya world, which spans across the countries of Mexico, Guatemala, Belize, and parts of Honduras and El Salvador, these entities still permeate through an imposed reality that stems from the colonial era. Starting in the 16th century, Indigenous groups of Maya descent were subjected to destabilizing colonizing forces in order to assimilate them to a Christianized way of viewing the world. Often, colonizers labeled these nonhuman agents as demons that needed to be purged from Indigenous minds, bodies, and souls. In Maní, Yucatán, Mexico on July 12, 1562, Friar Diego de Landa commissioned an auto da fe, in which "thousands of sculpted deity images and associated ritual paraphernalia," such as hieroglyphic codices, were burned (Christensen 2016, 22).

Yet, neither fire nor time could destroy these nonhuman agents, as they still inhabit the world—for instance, as features in the landscape. In this interdisciplinary session—split into three parts—we examine the myriad of nonhuman agents who populate the Maya world and regularly engage with human communities, as ancestors, deities, earth spirits, guardian angels, and other powerful beings. Using perspectives rooted in all four anthropological subfields and related disciplines, participants will examine how the Maya conceive(d) of, engage(d) with, and depend(ed) upon these beings in the past and present. Part 1 will focus on the living dead. Particularly, how the Maya interacted with their real and imagined ancestors, from regular ritual offerings to incorporating the dead into the foundations of houses and other structures. Part 2 will focus on the living landscape, from guardian spirits of specific domains to how statues were treated as living humans. Part 3 will focus on a wide range of other beings who populate the Maya landscape, from living mountains to the spirits of unborn children.

Presentation(s): Aj Kanul: Understanding a 'Guardian Angel' in Contemporary Yucatec Maya Thought

Among the Yucatec Maya of Mexico, the landscape is home not to just to humans. It is also home to supernatural beings. One such being is the aj kanul. Drawing on over 15 years of ethnographic field work in Xocén, Yucatan, Mexico, my collaborators translate this entity as a 'guardian angel' in Spanish. Each person is said to have one. Like a guardian angel, an aj kanul protects their designated human from harm and serves somewhat as an intermediary between the natural and supernatural worlds. Often, they are described by my collaborators as waiting patiently at one of the four corners of the yard for their humans to exit their home. If this 'guardian angel's' designated human leaves, they follow and protect their designated human. Yet, unlike a guardian angel, the aj kanul can be turned malevolent by the yuum balamo'ob, guardians, of the land in which the household resides. Oral narratives typically term malicious aj kanul, as those who steal babies or kill animals and humans. In this presentation, I provide a description of this entity. First, I attempt to provide a linguistic analysis of the term to situate the term's use in history. Then, I move to discuss how my collaborators relate to their aj kanulo'ob (plural form of aj kanul) in their daily lives through examining narratives from various speech genres that focus on how these 'guardian angels' became spiteful in the eyes of those they sought to protect.

Auguries in Yucatán: their role in communication between human and nonhuman agents and their potential for informing climate change adaptation

Traditional weather forecasting in Yucatán, Mexico, depends on auguries (tamax chi') and the observation of days in the new year (xook k'iin). This presentation focuses on the first of these, which involves the observation of animals, insects, and other beings, which communicate coming trends, such as the rainy season or drought. Auguries are based on empirical observations as well as underlying beliefs about how certain creatures signal important information to humans. Many continue to function today, while others do not due to climate or environmental change. When considered in aggregate, those that work can provide detailed information about climate shifts, potentially complementing the development of scientific models. Sometimes agricultural pests also act as auguries, a point that has come up in interviews we conducted with expert farmers in the town of Tahcabo. In this paper, we explore opportunities that the study of auguries can offer to climate change observation and adaptation. We compare the scope and sensitivity of such forecasts to scientific weather forecasting and climate modeling. In addition, we consider the significance of observed animals and insects as nonhuman agents that engage with humans and other beings across the landscape, to probe how auguries are understood to function. To do so, we draw on past interviews we have conducted together in the town of Tahcabo as well as those Kanxoc Kumul conducted as part of his thesis research in Chemax.

Dead but not gone: Captured Warriors and Revered Ancestors in Classic Maya Art

Captives in Classic Maya art are tied with rope, stepped on, and positioned in ways that emphasize their subordinate status. Yet they share some of these traits with depictions of ancestors. In this presentation, I explore the conceptual overlap between captive warriors and ancestors in Classic Maya art. Considering case studies from three Classic Maya sites, I examine works of art within their archaeological context to present an embodied analysis that considers the entanglements between sculptures, paintings, and people. Comparative material from Mesoamerican cultures past and present helps to clarify the role of both types of individuals. I argue that mapping the conceptual overlap between these archetypal characters in Maya art helps us better understand representations of power and agency in Maya site centers, and ultimately, how works of art communicated with many types of people in the Classic Maya world.

Over the Hill, and Through the Wood: Amidst the Ancestors in the Puuc Region

Xanab Chak is a small, Preclassic Period site (c. 900–300 BCE) that was identified as a result of a recent lidar flyover of the Eastern Puuc Region. Investigations within the civic core of the site over the past three years have confirmed that it remained relatively unaltered by later construction activities despite dense Classic Period settlement blanketing the region. Dozens of other Preclassic communities in the eastern Puuc were covered by successive cultural layers, as evidenced by Preclassic plazas uncovered at Kiuic, Muluchtzekel and Labna. The proximity of Xanab Chak to Labna leaves little doubt that the Classic Period residents of the eastern Puuc were familiar with this ancestral community in their midst. The fact that the site was largely left alone suggests later populations purposefully avoided disturbing the site too extensively. This may have stemmed from a reverence for the ancestors and their consecrated spaces, or perhaps the site's fortuitous location on the outskirts of the Classic Period Labna polity. At least one specific act of irreverence was uncovered during the 2024 field season in the form of an ancient pit excavated in the exact center of the ballcourt, demonstrating that respect for ancestral spaces was not absolute. This paper will explore the relationships between Preclassic Xanab Chak and the later communities that surrounded it, as well as the continued importance of visiting ancestral Puuc sites through the Postclassic Period.

8567 Public Engagement for Anthropologists of Reproduction

Start Date: 11/21/2025 2:30 PM **through** 11/21/2025 4:30 PM

Venue: Sheraton **Room:** Grand Chenier (5th fl)

Type: Workshop

Since the 2022 Supreme Court decision which ended federal protections to abortion rights, reproductive justice has been in the mainstream media and popular culture more than ever before.

Yet if you open a newspaper to read about this topic, you will find doctors and lawyers quoted as the sole experts on what is happening to people on the ground. Anthropologists are not often seen as experts on contemporary social issues - yet, we are the scholars most familiar with how people are experiencing structural, legal, and medical changes in their everyday lives, and in global perspective. The Council for Anthropology and Reproduction (CAR) wants to change that - starting with this workshop opportunity for researchers working on any topic related to reproduction (e.g. surrogacy, contraception, maternal health, welfare policy) to explore how they can become more engaged scholars. From the session you will learn about types of public engagement available to scholars, from advocating for policy to communicating with the media. The workshop will be led by Lisa Hernandez, Senior Reproductive Health & Rights Associate at the Scholars Strategy Network, with contributions from the Advocacy Subcommittee of CAR. The workshop emphasizes that there is no single way to be a publicly-engaged scholar, and demonstrates the different roles researchers can play in the policy and media arenas. We will lead participants through activities to identify how their own research can connect with the public, and then provide them with concrete tools and resources to take action. This workshop builds on the work that AAA is already doing to support engaged scholarship, by providing expert guidance specifically for anthropologists working across the subfields topics of reproduction, broadly construed. With growing attacks on biological and social reproduction globally, it is more important than ever that anthropologists how our research findings can contribute to making a more just world.

8546 Enacting NAGPRA's Duty of Care: Challenges and Best Practices

Start Date: 11/21/2025 2:30 PM **through** 11/21/2025 4:00 PM

Venue: Sheraton **Room:** Grand Couteau (5th fl)

Type: Workshop

This workshop will familiarize participants with recent updates to the Regulations for the Native American Graves Protection and Repatriation Act (“NAGPRA”), focusing on section 10.1(d), “Duty of Care.” This section requires museums to consult with Tribal Nations regarding the appropriate care, handling, and curation of Native American Ancestors and cultural items; to incorporate these Nations’ preferences to the best of their ability based on traditional Tribal knowledge; and to obtain free, prior, and informed consent prior to any form of access to NAGPRA collections. The workshop will provide an overview of these requirements as well as examples of the successful incorporation of traditional care and consent practices in museum curation for these Ancestors and cultural items.

Additionally, participants will have the opportunity to ask questions and discuss possibilities for this work with the organizers and with each other. Please bring questions and concerns for group discussion. If time allows, we will also address other updates to the NAGPRA Regulations; but Duty of Care has become a primary focus for museums and Tribal Nations under the new requirements. We will discuss how practitioners can work collaboratively across units, departments, and even institutions to facilitate thoughtful and impactful NAGPRA compliance.

3700 Reflections on Mentoring Black Anthropologists in the US South

Start Date: 11/21/2025 2:30 PM **through** 11/21/2025 4:00 PM

Venue: Sheraton **Room:** Maurepas (3rd fl)

Type: Roundtable/Town Hall

The roundtable discusses mentoring amongst Black anthropologist working in academia across various departments and appointments and explores the challenges and opportunities of working in Southern U.S. public institutions. Working in various departments outside of anthropology, including Black Studies and Sociology, we detail experiences working in an environment where diversity is under assault politically at the national and state levels. We will explore the challenges of institutional racism and bias, political climate, limited resources, cultural and social barriers. Mentorship, including mutual mentoring, plays a significant role in navigating challenges spaces at PWIs, as well as emotional and mental support. Despite these and other challenges, Black Anthropologists built supportive networks, continued activism and advocacy, worked across disciplines, and demonstrated resilience and adaptability.

7047 Haunting Presences and Absences: Ghosts in Contemporary Institutional Contexts - panel 2

Start Date: 11/21/2025 2:30 PM **through** 11/21/2025 4:00 PM

Venue: Sheraton **Room:** Napoleon BR A1 & A2 (3rd fl)

Type: Oral Presentation Session

Death does not always bring closure. In many cultural, clinical, and personal contexts, the dead linger as memories, as spirits, as unresolved trauma, or as institutional absences. Death can also awaken haunting recollections of past (traumatic) events or revive forgotten relationships. Hence, this panel explores the theme of Ghosts through the lens of medical anthropology, focusing on how individuals, families, communities, and healthcare systems engage with the spectres of death and dying.

Within Western medicine, ghosts, as well as other supernatural mysteries and unquantifiable experiences, have been largely displaced by objectivity and evidence-based frameworks. Yet despite this clinical omission, ghosts remain omnipresent (e.g., Langford 2013; Hume 2018). They manifest in the quiet hauntings of healthcare workers, the persistent presence of ancestors in patient narratives, the gaps left by institutional neglect, and the emotional and spiritual residue of

suffering and dying. Medical practices may even be built on or around the very ghosts they were supposed to supersede (e.g., van der Geest 2005; Langford 2016).

Organized by the Death and Bereavement Special Interest Group of the Society for Medical Anthropology, this panel invites contributions that consider how death and dying are entangled with haunting absences and aching attendances and how the dead are remembered, embodied, erased, or summoned in medical, communal, and personal spaces.

The papers of this panel will examine literal and metaphorical ghosts across diverse settings, illuminating the ways in which presence persists, despite medicine's best attempts to render absence final. More specifically, this panel will address how structural ghosts of colonialism, racism, and systemic neglect continue to shape experiences of dying and mourning. How do ghosts make themselves known in the lives of the bereaved? What does it mean to be haunted by a death poorly handled, or silenced, or by a grief that defies linear resolution?

Presentation(s): Managing Ghosts in Cantonese Culture

The research on which this paper is based was carried out in the Cantonese-speaking region of southern China which includes Hong Kong and the adjacent province of Guangdong. Canton is the old name in English for Guangzhou, the capital of Guangdong. In traditional Chinese culture ghosts of all kinds have been viewed as significant actors capable of participating in everyday life. This paper will focus more narrowly on two kinds of familial ghosts who, for one reason or another, communicate their distress or disappointment with their family's failure in its duties to the ghost. The first type of ghost is that of someone who died young and never had the chance to be married. It wants its family to arrange a "ghost marriage". The family will seek out a spirit medium to arrange such a marriage. The second type of ghost is that of someone who died very recently, and its gripe usually concerns shortcomings in funerary or mourning activities. People become aware of a ghost's efforts to contact them when a family member experiences inexplicable anxiety or illness or when the family is embroiled in conflict. Hopefully managing the ghost will solve the problem.

Specters of Covid Care: Loss, Death, and Temporality in Elder Care in Lisbon

Amélia, grieving alone in silence, is haunted by the specter of her husband. They both arrived at the Santo António Parochial Senior Social Center in Lisbon in 2021, which houses a day center for the elderly and an overnight "short-term" rehab center called the Night Center. Both Amélia and Joaquim were affected by the Covid-19 pandemic and experienced injuries/illnesses associated with old age. While in the Night Center, they adjusted to a shared space, to the uncertainty allotted

to unstable yet temporary changes to daily life. Temporary modifications morphed into permanent uncertainty – Joaquim passed away suddenly. Given Covid-related restrictions, or so she thought, Amélia was unable to attend his funeral. No one had even asked her if she wanted to go.

With full Center life moved on from Joaquim's death, Amélia languished in her grief. His absence haunted her experience in institutionalized care, in which temporal boundaries themselves began to vanish. Despite it being a short-term facility, Amélia has been at the Night Center for years. Joaquim's death became unspoken but lingering, a specter of what gets lost in underfunded, over-stressed, neoliberalized institutional care settings that exist between/betwixt social life and social time. In discussing the melancholic case of Amélia and Joaquim in this paper, I aim to illustrate how the specter of early Covid-19 continues to haunt the limits and potentiality of the Center, and how it continues to affect the ways elder

Absent Fathers, Institutional Hauntings: Grief, Silence, and Spectral Justice in Post-Dictatorship Gambia

In post-dictatorship Gambia, grief persists in the absence of closure. For adult children of the forcibly disappeared, many of whom lost their fathers during Yahya Jammeh's regime, mourning is shaped by both personal loss and the state's failure to acknowledge it. Drawing on ethnographic fieldwork with victims' families and civil society organizations, this paper explores how the disappeared reappear in everyday life: in portraits, WhatsApp avatars, silences, and untouched archives. These ghosts haunt the very institutions meant to deliver justice, including commissions that heard testimonies but failed to return remains, bureaucracies that stalled on reparations, and governments that transformed remembrance into delay. Once hailed as a site of reckoning, the Truth, Reconciliation and Reparations Commission (TRRC) now symbolizes suspended expectation. Through the lens of medical anthropology, I explore how haunting circulates across personal, communal, and bureaucratic spaces, and how grief becomes a form of resistance. It demands recognition where the state offers silence. In this context, even institutions become haunted: by the unburied, the unacknowledged, and the still-waiting.

Presenter(s): Aminata Ndow

Finnish Deathlore Revisited: Sightings of the Spirit Birds

Thinking, talking, and imagining one's death can become paralyzingly tricky the closer death comes. This is especially true in secularized and highly medicalized cultures, such as Finland, where the Christian language provided by the Lutheran Church has "ceased to speak" to people. How do people communicate about death and dying in this climate?

While conducting ethnographic research among Finnish hospice patients, the absence of the language of death was occasionally filled with aesthetics and nature imageries, which were used to point toward death. These were not merely expressions, however, but accounts of actual, real-world events and encounters concerning supernatural agents—the dead. Some of these involved

the ancient Finnish idea of an ominous kalma bird ("death bird") foretelling an approaching death. The more common and consoling encounters took place with a sielu bird ("soul bird"), a manifestation of the soul of the deceased, which visits grieving family members. The idea of a "soul bird" directly references the shamanistic understanding of a spirit departing in animal form.

In this paper, I will delve into the various ways in which the haunting presence of death becomes speakable and tangible via pre-Christian imageries and language. My data illustrates modern adaptations and innovative aesthetic ritualizations built around the ancient Finnish deathlore, shedding light on how these traditions continue to evolve in contemporary Finnish culture.

The Haunting Presences of Future Deaths: Life insurance and the Right to Grieve in New Orleans

While the city of New Orleans is a haunted place, specters of death do not manifest equally for all residents. Patterns of mortality reflect enduring histories of racialized inequality and intersect closely with socioeconomic class. Since the rise of urban violence in the 1970s, Black and poor residents have had to increasingly deal with sudden, untimely deaths in their families. This situation has upturned normative expectations about the timing of death and about who will have to care for whose remains. Based on ethnographic fieldwork (2017-2018), I describe how African American parents and grandparents in New Orleans find themselves confronted with the need to reckon with the (future) deaths of their children and grandchildren. They do so, importantly, by securing finances to mourn not yet deceased kin through the consumption of life insurance policies. In this paper, I consider the ways that people relate to the future potentiality of untimely death in terms of haunting. While haunting tends to be used as a metaphor for the lingering presence of systemic injury from the past (Gordon 1997; Holloway 2003), some scholars have suggested that ghosts may come from the future as well (Zeitlyn 2020). I use the notion of haunting—of absent-presences and morbid dreads—to draw out how death acquires a ghostly presence: not yet fully present but already effective in anticipatory actions like the consumption of life insurance.

7928 Educational hauntings for inclusion: Excavating the remains and learning from the resurrection of unsettled spirits

Start Date: 11/21/2025 2:30 PM **through** 11/21/2025 4:00 PM

Venue: Sheraton **Room:** Napoleon BR A3 (3rd fl)

Type: Oral Presentation Session

Our present education reality is built on past education histories of exclusivity: white, ableist, heteronormative, male supremacy. This panel aims to unearth, using (auto)ethnographic methods, the sociocultural and political vestiges of these histories of education and identity exclusion that are present in institutions today: in elementary and middle schools, as well as on university campuses. The first paper examines how queer cultural apocalypses of the past inform queer

responses to crises on current university campuses, which in turn, will shape queer futures . The second paper reveals the prevalence of PTSD in the teaching profession, questioning how teachers who are tasked with implementing social emotional learning for their students when their school ignores their own well being. The third paper. focuses on the unheard--the deaf, hard of hearing, and those with assistive devices, who are neglected in the education system with regard to necessary resources. The fourth paper shows the difference a teacher can make when they prioritize their identity as mentor for BIPOC middle school students over the traditional role of teacher, who imparts knowledge and focuses on classroom management, shifting the classroom and school culture. Finally, the fifth paper problematizes mental health student services on a university campus, describing the connection between neoliberal policies and the pathology that it induces in college culture. Resurrecting these unsettled spirits, these panelists recall the past with the present and provide suggestions for the education futures of those who have been left behind, if not mummified.

Presentation(s): Apocalyptiqueer: Lessons from Ethnographic Investigation of Queer Worlds in Crisis

Under a second Trump administration, 2SLGBTQIA+ people in the United States are facing increasing human rights infringements and erasure. From prohibition of gender-affirming healthcare, bans on transgender youth participating in sports, and the legal formalization of the false equivalence of gender and biological sex, queer and trans students and youth in particular face existential threats. By conceptualizing apocalypse as a radical shift due to "the end of the world as we knew it" either for an entire community or for one person's lifeworld (Husserl, 1970), this study examines how queer apocalypses of the past inform queer responses to crises of the present which in turn shape queer futures (Muñoz, 2009; Castiglia & Reed, 2011)

Using border theory (Anzaldúa, 1987; Morales, 1995), I examine how queer students respond to and subvert dominant societal forces mediated through schooling in the borderlands between their homeworlds and alienworlds during the Trump administration (Steinbock, 1995). Through (auto)ethnographic investigation, I highlight how LGBTQ+ university students are navigating a homeworld in crisis. By "learning from Apocalypse with grace, rigor, and curiosity" (Brown & Brown, 2017), I consider individual and collective responses to crises as informed by queer cultural memory, not just across time and space but between worlds. Such liminal experiences showcase not only how the present is shaped by the past, but also how echoes of worlds no more and even dreams

Presenter(s): Austin Hayes

Teaching with Trauma: Teachers' Ghosts of Childhood Past

Teaching can be emotionally laborious, but for educators with personal trauma histories, working in trauma-impacted schools can stir the echoes of past experiences, and may introduce unique challenges related to their mental health and professional well-being, as well as their classroom teaching (Bride et al., 2004; Figley, 1995; Jenkins, 2002; Stamm, 1999; U.S. Department of Veterans Affairs, 2025). While much research focuses on social emotional learning for students with high Adverse Child Experiences (ACEs) scores, less attention has been paid to the teachers who carry their own ghosts into the classrooms. This mixed method study combines the auto/ethnographic observations and personal stories of elementary public-school teachers, including myself, with the results of teachers' self-assessments using the Secondary Traumatic Stress Scale (STSS) (Bride, 1999) and the Professional Quality of Life Scale (ProQOL) (Stamm, 2008). The findings interrogate a complex school culture, which asks teachers, many with PTSD themselves, to take steps to address the social and emotional well-being of its children. Attempts to do so remain inadequate without taking measures to include school culture that also ensures adequate social and emotional teacher support.

Presenter(s): Alexandra Imperi

Spirits of the Unheard: Reflections of a Speech-Language Pathologist

The purpose of this autoethnographic paper is to discuss my experience as a speech-language pathologist and advocate for elementary students who are deaf and hard of hearing and students who use Alternative and Augmentative Communication (AAC). IDEA (1975) and ADA (1990) are in place to protect this population, however, this student population continues to face ongoing adversities, such as not being provided with an interpreter, limited access to their speech generating devices, limited access to resources, and unequitable access to educational information/activities. The lack of these resources produces further social and learning isolation. Like Jen Stacy (2025) I use border theory to denote the spatial, cultural, social and mental markers that limit this population from living and learning fully. Noting my experiences with this population, I offer both the challenges and the different ways I have been able to advocate for these students' rights, as well as teach them to self-advocate. Therefore, this paper aims to bring awareness to the students who are Deaf and Hard of Hearing, and those who use AAC the adversity they may encounter in school, advocacy suggestions for teachers and parents, as well as how one might teach self-advocacy.

Presenter(s): Nicole Loper

Mentoring beyond the curriculum: The hauntings of BIPOC youth and their mentor

The purpose of this autoethnographic paper is to discuss my current mentorship work in an Oklahoma public middle school, saturated with noises and silences that attach to histories and cultures, violence and joy. Schools are places haunted by histories of oppressions (Caputo, 2016; Tanner, 2022; Zembylas, 2013). In the United States, the specters of racism, sexism, ableism, and other "isms" affect students in both material and immaterial ways. Although my official job title is

special education teacher and coach, I identify as "mentor" because, for me, mentoring takes priority over curriculum and is my curriculum. As a black mentor to BIPOC youth, their struggles, in school and at home, hearken my ghosts and my ancestors' past. Using (auto)ethnographic methods to document the current stories of youth and my reflections on the ways they connect with my youth, I illustrate both the similar and distinct ways in which BIPOC youth have had to and continue to struggle, resist, fail, and succeed: resilient before a malignant education system. I also show how mentorship might be conceived and what is needed to exorcise this systemic oppression from schools.

Presenter(s): Terrance Green

It's Never Enough: An Anthropological Autoethnography of a University Mental Health Counselor

As a mental health counselor working for University and College Counseling Centers (UCCC), I have experienced commodification, objectification, and isolation in my campus profession, reflective of the structure and process of their mental health counseling services. An institution's culture is subsumed by the pathology it induces, and university counseling centers have adapted to this structural pathology in various ways. The purpose of the study is to explore how institutional structures, and the prevailing culture of mental health practices, impact the care of students in higher education institutions. Using an autoethnographic approach, I examine the evolution of university and college counseling centers and their practices, enabling the examination of social and cultural contexts through personal experiences (Reed-Danahay 2009; Chang 2016). I provide unique insights into the social and cultural experiences on campuses, especially the institutional neoliberal values that significantly contribute and shape the college counseling experiences. Thus, ironically, a service which exists to support students' wellbeing oftentimes may contribute to their mental health struggles.

3461 Beyond the Colonial Specter: Haunting, Memory, and the Persistence of Black and Indigenous Worlds

Start Date: 11/21/2025 2:30 PM **through** 11/21/2025 4:00 PM

Venue: Sheraton **Room:** Napoleon BR B1 (3rd fl)

Type: Oral Presentation Session

Ghosts entail the past, the haunting of places, and that they are seen, heard, and felt in the present. In Avery Gordon's *Ghostly Matters: Haunting and the Sociological Imagination* (1997), the author provides us with a framework for better understanding the unresolved histories of violence and exploitation, including how these histories continue to be felt in the present. Kennedy et al. (2017) use "haunting" to describe whiteness as a force, one that subtly influences perceptions, behaviors, and institutional structures, reinforcing racial hierarchies. These 'ghostly traces' persist through absence, silence, and repression, manifesting in ways that continue to shape contemporary Black

and Indigenous life (Hartman 2007; Sharpe 2016; Simpson 2020). In other words, unresolved histories of white settler violence and exploitation continue to render white bodies and practices unmarked and leave Native and Black bodies and practices highly marked. In this panel, we seek to address these structural imbalances while opening up discussions of spectral imaginaries outside colonial thought-worlds. The haunting framework allows us to think multi-directionally and cyclically, undermining the hegemony of white settler cultural norms. Being attuned to ghosts disrupts the linear space-time or chronotopes (Bakhtin 1981) of white settlerism, and allows for something beyond an ambivalent specter of the colonial past, such as benevolent ancestors "haunting" their descendants. Turning to benevolent ghosts allows a reassessment of how Indigenous and Black life continues to be haunted, ultimately pointing to the intergenerational creation and transmission of anticolonial knowledge (Anderson 2009; Sharpe 2016).

American liberalism desires a post-racial present that can ignore race altogether (Powell 2017). Refusing interpolation by whiteness as a normative positionality reframes the ghosts of imperialist and racialized acts of violence as a foil to the presumed invisibility of whiteness. There is no "settled" past upon which this presumed whiteness can rest. Even when haunting is framed as unsettling to whiteness, we work to decenter white desires and perspectives, opening up room for non-white alterities to come to the forefront (Cameron 2008). The very existence of Indigenous and Black life today has persisted through cultural and epistemic erasure, alongside the violence of white supremacy and racial capitalism (Robinson 1983; Coulthard 2014; Hartman 2019; Jackson 2020; Dunbar-Ortiz 2021). This challenges a history that always rested on Black death (King 2019; Hartman 1997), the exploited labor of non-white immigrants (Lowe 2015), and the possession of Indigeneity (Moreton-Robinson 2015). In this panel, we turn to intergroup dialogue (John and Brown 2019) to show how Indigenous and Black histories, knowledges, and relations are constantly in motion across time. Continuing to center Indigenous and Black livingness, we hope to cultivate lively possibility.

Discussant: Jenny Davis, University of Illinois, Urbana-Champaign, Department of Anthropology

Presentation(s): Speculative Indigeneity: Transformative Scenario Planning and Tlingit Ancestral Futures

This paper troubles the temporality of haunting by identifying "ghosts" in the speculative process of "Transformative Scenario Planning." Based on ethnographic research taking place on Lingít Aaní (Tlingit homelands) from January to April of 2024, it will consider the "Possible Future for Southeast Alaska" document (2024) and planning process. The document lays out four future scenarios for

Southeast Alaska between 2025 and 2050. Initiated by the CDFI Spruce Root as a resource for the new Tongass National Forest Plan, there were over thirty contributors region-wide, including several who are Tlingit. During the planning process, one suggested scenario postulated that Indigenous peoples would no longer be present in the region by 2050. Given our 10,000-year history on the land, Tlingit absence by 2050 was not considered plausible. The presence and longevity of Tlingit ancestors thereby became a haunting claim that called these ancestors forth (Cariou 2006), strengthening their descendants' present and future land claims. This connection to land is reflected concretely in the scenarios' intended use in the Forest Plan. As Tsing et al. observe, "[E]very landscape is haunted" (2017). The Tongass is haunted by ancestral knowledge and stories, as well as by settler histories and violence. The tensions between ambivalent and benevolent ghosts shape the past, present, and future of Lingít Aaní and, in turn, the speculative imaginings laid out in the scenarios.

Presenter(s): Sabena Allen

Laayli' Kuxa'ano'one: Sonic Vitality and the Haunting of Capitalist Modernity in the Yucatan Peninsula

Laayli' Kuxa'ano'one is Yucatec Maya phrase that translates roughly to "we are still living". It is a favored phrase of Yucatec Maya rapper Pat Boy and the ADN Maya Colectivo—a Yucatec Maya rap collective—who used the phrase as the title of their contribution Marvel's Black Panther soundtrack. Such public assertion of vitality is noteworthy in the peninsula where Maya erasure continues as part of capitalist modernity. Drawing on Gordon's work (1997), Castellanos (2010) demonstrates how Maya people in the Peninsula resurrect "fantasmas of modernity" through adaption of locally salient cultural practices and tactical integration into modernism. In my presentation, I build off this work to show how young Maya musicians both resurrect fantasmas and embody fantasmas to haunt capitalist modernity. Through music, they articulate their vitality against the grain of modernist practices that look to make phantoms out of Indigenous life. I present two creative concepts emerging from hip hop that contemporary Maya musicians use to assert their vitality and haunt capitalist institutions: 1) sampling—an act of reaching into collective memory and archives through sound, and 2) Flow—rappers' "way of being" that emerges through musico-linguistic performance. Such sonic vitality haunts those who listen through capitalist modernity and disrupts colonial narration of Maya ways of being dead or dying.

"Doing it the way my ancestors showed me how": Afterlifeforms and the persistence of Black Environmental Consciousness in the U.S. West

Black kinship with the more-than-human enlivens Black lifeforms, landscapes, and futures of abundance. Intersecting Gordon (1997) and Hartman (2007) with the Black Ecological framework (Hosbey et al. 2022), "haunting" describes both the spectral imprints of Black trauma and the enduring presence of ancestors, which shape US landscapes and their relations today. The specter of Black terror on the land haunts in the form of the "big lie" – Black people don't do nature. I

examine how contemporary Black communities in Arizona and Washington engage with land through ancestral practices of care and survival against the backdrop of ongoing settler colonialism and racial capitalism. Soothing the specter of Black trauma that haunts natural spaces enlivens the work of Black ancestors as "afterlifeforms" (Padilioni 2022, 16) – or ghosts. The work of these Black gardeners, naturalists, conservationists, and hobbyists represents a call to recognize the intergenerational persistence of Black environmental consciousness, which disrupts racialized narratives of 'nature' as an arena for Black terror or 'land' as terra nullius. Black ancestral knowledge contests the erasure of Black lifeforms and insists on a relational, anticolonial re-engagement with the environment.

"I hear my father's people in the river": Dispelling Colonial Ghosts through Chronotopes of Tlingit Naming Practices

This paper investigates the cultural practice of naming in the Tlingit community, an Alaska Native tribe of Southeast Alaska. I look into two Tlingit speeches about names and voices. Tlingit naming practices allow people to be embodied by past ancestors in the present, transcending settler colonial temporalities of linear time. The names also derive from events that took place, allowing individuals to bring their ancestral homelands with them wherever they go. Utilizing the terms ghosts and haunting, we understand that the naming process in Tlingit allows the community to access Indigenous knowledge that overshadows settler colonial goals of erasure and elimination (Wolfe 2006). These Tlingit chronotopes, meaning space-time (Bakhtin 1981; Blommaert 2015; Ennis 2019; Wirtz 2020), show that present-day Tlingit people create space and bend time to bring in ancestors as a way to instruct and to elaborate on what it means to be Tlingit. This process of naming, which is traced back to a time before settlers came to Alaska, shows how Tlingits, by continuing their way of living, is inherently decolonial as it claims the land and allows the ancestors to saturate settler signs with Indigenous meaning (Marks 2025). Thus, even when whiteness haunts them (Kennedy et al. 2017), Tlingits dispel white ghosts by occupying space-time with ancestors, ultimately revealing how Indigenous-derived practices produce decoloniality without centering whiteness or settler colonialism.

3995 Multiple Eyes on Belonging and Dying in the Southwest Transborder Region; Theoretical and Methodological Diversity, Contradictions, and Thematics

Start Date: 11/21/2025 2:30 PM **through** 11/21/2025 4:00 PM

Venue: Sheraton **Room:** Napoleon BR B2 (3rd fl)

Type: Roundtable/Town Hall

As the aftermath of the publication of the "The Rise of Necro/Narco Citizenship" it stimulated some

discussion to converse about how our theoretical and methodological assumptions influence the directions and thematics that we emphasize to narrate the major aspects of the Southwest North American Region especially as the consequence of militarization its intersection of and support of the drug trade and the tragedy of hundreds of thousands of its casualties: physical and cultural . Some of us found ourselves in abject pessimism after analyzing the work after years of writing about the amazing creativity of its constituent populations. Are our approaches increasingly problematic as our work matures? Are we reaching an end road to discoveries and now settling in on final spaces of material and labor extraction that confine our insights and understandings? Are we selecting ethnographic populations to reinforce our newly found grounds for pessimism? Is this a temporary juncture of a historical moment when clarity of direction is muddled and grey or clearly a road of perdition in this stage of global capital? Lastly, how do we best apply our knowledge given these issues? The roundtable seeks to uncover these layers of thinking and doing on the region.

4543 Real Ghosts?! Not Metaphors, Not Hauntology, Not Derrida (part 2)

Start Date: 11/21/2025 2:30 PM **through** 11/21/2025 4:00 PM

Venue: Sheraton **Room:** Napoleon BR B3 (3rd fl)

Type: Oral Presentation Session

In anthropology, ghosts are often understood as cultural symbols, historical residues, or figures of social haunting. Yet, for many, ghosts are also social actors-inhabitants of lifeworlds, interlocutors, and kin. This panel explores what it means to move beyond representing ghosts as metaphors and instead take them seriously as part of the social realities we study and inhabit.

Anthropologists have long walked a fine line between respecting their interlocutors' beliefs in spirits and maintaining analytical distance. Evans-Pritchard's *Witchcraft, Oracles, and Magic Among the Azande* offers a classic example of this epistemic move, where he first appears to "believe" he has seen a ghostly light, only to later assure the reader that it must have been a lantern. More recent work, such as Jon Bialecki's engagement with Bruno Latour, has called for taking spirits as social actors--without necessarily breaching the wall of methodological atheism. This panel asks: What if we do breach that wall? What happens when anthropologists, too, can see ghosts?

Bringing together scholars who not only study spirits and ghosts but also share lifeworlds with them, this panel examines how such relationships reshape ethnographic writing. It considers the

forms of storytelling, voice, and methodology that emerge when spirits are not just objects of analysis but co-authors of our worlds.

The presentations in this panel span a wide geography—from German Anthroposophy to Afro-Atlantic Spiritism, from Nigerian classrooms haunted by displaced jinn to Catholic elites engaging with angels and demons. What binds them is a shared attention to the lived presence of spirits as agents of ethical encounter, historical reckoning, and epistemological transformation. These ethnographies do not merely document belief but show how spirits move through language, pedagogy, memory, and space-demanding new methods for listening, relating, and writing within worlds animated by the spectral.

Presentation(s): A Lesson in Communing with the Dead

In Anthroposophy, the dead do not depart from this world after crossing the threshold. Instead, they linger—confused and in need of spiritual nourishment, particularly if they failed to cultivate their spiritual capacities while alive. The living are thus tasked with helping the dead find their way: by developing relationships with them, directing them toward the light, and fostering their continued spiritual development. Drawing on my fieldwork in Stuttgart among the Anthroposophists, this talk explores the techniques they employ to commune with the dead—such as reading aloud to them, addressing them in the language of feeling and image, and meditating on shared memories. These practices reflect a belief that the boundary between the living and the dead is permeable and ethically charged. I argue that the Anthroposophical approach challenges dominant secular norms in Europe not only by insisting on the real presence of the dead but also by demanding a transformation in how we think about relationality and responsibility. Much like anthropology's attempts to translate spiritual worlds into the language of belief, Anthroposophy walks a fine line between spiritual conviction and the performance of secular credibility. This paper asks what it means to speak with—and for—the dead within a spiritual movement that seeks public legitimacy while insisting on unseen truths.

Presenter(s): Arman Yildiz

Causal Social Spirits: Errancy and Dislodging in and Beyond Afro-Atlantic Spiritist Circles

This presentation will explore the *Espíritu de Causa*, a form of errant spirit encountered in Espiritismo or spiritism as practiced in Cuba, often in tandem with Afro-diasporic traditions of Santería or Lucumí. An *Espíritu de Causa* attaches itself to a medium or an individual that is announced through profound and burdensome "causes" or missions, representing a critical issue, unresolved conflict, or pressing matter and characterized and described as "stuck," similarly ascribed to ghostly behaviors and hauntings in Euro-American interpretations of supernatural phenomenon. The paper will engage ethnographic fieldwork to evidence how *Espíritus de Causa* creates opportunities for community members to discuss critical spiritual and social issues,

relating them to the spirit's life history, struggles, or unfinished terrestrial business. In this way, the Espíritu de Causa highlights a more profound, spiritual dimension of causality, where the "cause" transcends mere circumstance or happenstance and is intricately tied to the community's spiritual homeostasis. The presentation presents examples and suggests a new way of conceptualizing how moments of shared embodied and communicative practices and spiritist strategies are employed to locate, unblock, and resolve errancy and malaise for both the person and the spirit.

Presenter(s): Martin Tsang

3943 Epistemologies of coordination: learning from kinship, relational knowledges, and Indigenous pasts to imagine beyond crisis

Start Date: 11/21/2025 2:30 PM **through** 11/21/2025 4:00 PM

Venue: Sheraton **Room:** Napoleon BR C1 (3rd fl)

Type: Oral Presentation Session

Anishinaabe scholar Kyle Whyte (2021) describes epistemologies of coordination as ways of knowing the world that emphasize the importance of moral bonds for generating the responsible capacity to respond to a constantly changing world. Drawing on Indigenous knowledge traditions, epistemologies of coordination center moral bonds of relationships among diverse beings dwelling together in sharing environments. An alternative to crisis epistemologies— narratives which center violence, promote colonial unknowing (Calderon & Urietta, 2019), and assume the colonial power of "firsting" (O'Brian, 2010)-- epistemologies of coordination are much needed approaches to understanding knowledge and educating for community. This panel engages epistemologies of coordination in contexts of education through remembering and repurposing expansive histories of knowing rooted in continuous relation with place (Stevens, 2021) and diasporic community saberes (Urietta, 2016) to sustain moral bonds of relationality among people, the environment, and spiritual worlds. Through persistence to learn, problem solve, create, and share in moments of failure, injustice, and unethical action, papers untangle threats to sustaining long-term relationships between people and place, and examine how Indigenous Peoples, children through elders, cultivate conditions for epistemologies of coordination to thrive as guidelines for how to 'live well' with our dynamic changing planet. Drawing from oral histories, archival records, collective memory, childhood socialization, and institutional interactions, panelists highlight the intricacies of ever-dynamic practices of kinship for sustaining balance and addressing inequities in environmental, social, and cultural systems. Acknowledging the boundaries between beings from other worlds, and those living in the human world, papers enter a coordinated dance between relational accountability to the gifts and struggles of prior worlds, and the embodied responsibility to endeavor to learn and teach moral lessons into this current life. Papers ask questions such as: What does it mean to engage in a changing world with mutual responsibility? What knowledge is sustained when listening to the past and how do epistemologies of coordination open pathways to solutions in contemporary contexts of education? How are Tribal Nations and Indigenous communities threading past to present to build viable futures? and, In what ways do practices of Indigenous socialization sustain generosity and mitigate crises in the relationship between people

and land in education contexts?

Presentation(s): Arapaho knowledge systems, relationality, and STEM

This paper explores the intricate connection between Arapaho Knowledge Systems (AKS) and principles of Science, Technology, Engineering, and Mathematics (STEM), specifically within the context of Northern Arapaho tipi construction. Rejecting school narratives of Arapaho student failure in STEM, as defined through standardized assessment tests, I propose Arapaho people are deeply knowledgeable in STEM principles, yet such knowledge has been hidden behind colonial learning systems. Through interviews with Arapaho elders and analysis of archival data, my research investigates how traditional Arapaho knowledge embodies science, technology, engineering, and mathematics. The study highlights the holistic nature of AKS, where storytelling, observation, and community practices serve as foundational educational methods. The Arapaho Life Movement framework (Moss, 2022; Anderson 2008) helps explain how AKS is relational and foundational for the Arapaho nation through their storytelling and tipi construction. Using the Arapaho origin story as a setting to explain phenomena and how each life stage the Arapaho experience puts them in relation with the tipi, people, animals, spirit, and universe. Ultimately, it argues that Indigenous knowledge holds inherent STEM concepts that can enrich educational systems grounded in Indigenous Knowledge Systems(IKS) to help bridge Western contexts.

Presenter(s): Iva Moss

Chickasaw Higher education: Exploring relational investments in nation building

The Chickasaw Nation has advocated for their citizens' education since the late 1700s (Cowger & Caver, 2017). Before their forced removal, the Chickasaw nation set up schools in their homeland, where elders and chiefs regularly visited to check on student progress (Cobb, 2000). Understanding early on that colonizers would not be leaving their land, the Chickasaw people recognized federal education plans designed for "civilization" needed to be repurposed as a tool for economic resilience, cultural preservation, and survival. After removal, the Chickasaw people rebuilt their schools and were investing more per capita than any other nation at the time – allocating up to three-fourths of their annuity to education (Baird, 1974). Though Chickasaw history is full of haunting struggles, the ancestral stories have guided their present-day resilience. Today, the Chickasaw Nation honors the past and provides for the future of their people by providing tutoring, connections, and scholarships, supplying \$32.1 million in 2024 alone (Anoatubby, 2024). Most recently, the Chickasaw Alumni Association has launched to further build community and provide

guidance for citizens. This paper seeks to explore the impact of the Chickasaw Nation's efforts in connecting citizens to their legacies while creating a pathway forward. Through surveys and interviews of alumni, this research will address Chickasaw post-secondary students' current perceived needs for continued resilience and connectedness.

Presenter(s): Traci Lewis

Celebrating Hoche Indigenous language through oral and multimodal literature: Language revitalization between, within, and across generations

The challenges surrounding contemporary Hoche Indigenous language practices in rural China has created urgent demand for Indigenous epistemological coordination practices in these regions, where Indigenous Hoche ways of knowing are underrepresented in language education. The focus of this presentation is to investigate ways of fostering intergenerational awareness among the Hoche youth by integrating Hoche knowledge systems into language education. Given that Hoche language systems are embodied and culturally situated, adopting multimodal and multifaceted approaches are necessary to effectively support the reclamation of oral literature, language practices, and culture among Hoche youth. Oral traditional storytelling, as a performed art, connects past, present, and future and tightens Indigenous community kinship and bonds (Archibald, 2020; Naranjo, 2017). Indigenous language pedagogy has already developed a holistic view of literacy as a social practice that embraces stories, poems, dance, and music. Making space for these indigenous pedagogies is imperative, as they provide children opportunities to learn and construct Indigenous identities as they observe, listen to, and imitate family members (Kitson & Bowes, 2010). Yimakan storytelling is one of the most important Hoche oral literary genres that highlights the Hoche ancestral knowledge gained from Hoche land, river, history, and spirit. This paper explores the necessary inclusion of Yimakan oral traditions in schooling.

Everyday Embodiments of Mutual Responsibility among Babies and Toddlers who Share Space in Tahlequah (United Keetoowah Band of Cherokee Indians)

This presentation focuses on present and past coordinations of mutual responsibility (Bang et al., 2018) during daily life within a babies and toddler classroom near Tahlequah, the tribal headquarters of the Cherokee Nation and the United Keetoowah Band of Cherokee Indians (UKB). Drawing from a multi-sited, video-cued study co-constructed with nine communities, we offer two examples of babies and toddlers caring and taking responsibility for one another while coordinating their efforts with caring adults. In one example a five-month-old was crying uncontrollably for a few minutes while an 11-month toddler looked on. In the second example, toddlers and babies gathered at a table in the classroom multiple times, an act that required patience and long waits by adults and children alike. The two examples were both ordinary – meaning they happened often – and extraordinary – meaning that they were significant in their happening because they showcased what Marin (2018; 2020) calls ambulatory sequences, or the ways in which learning is embodied through the conditions of sovereign, culturally-rooted and agentic movement. We share how UKB

and Cherokee educators and community leaders responded to both examples and used stories from the past and present to explain how and why their children know and respond to collective needs so young. Elders explained young children's ability and desire to collaborate as a healing act and a way for children to feel connected to the larger group.

Uncovering the benefits of programs that support Indigenous people in their academics:
Countering colonial amnesia in institutional settings

Activism of academic institutions by Indigenous people is not new (Deloria, 1969; Keil, 2013). Indigenous people were forced to assimilate through tactics such as boarding schools. It was fitting that Indigenous people would fight against colonialism through what was used to assimilate them, by continuing into and transforming university settings. The increase in Indigenous academics allows for the increase in the narratives made through "research" by non-Indigenous people. The Center for Native American Development (CNAD) is the first program at the University of Idaho to serve Native American graduate students. At the time of the development of this program, the Red Power movement was when Native Americans were protesting the Bureau of Indian Affairs, broken treaties, and were pushing for self-determination. The Northwestern Native American Graduate Program had members not only push for the program but also proposed that they be the "advisory board." Through archival research we were able to find information on the program and connect it to now, however, it was scarce. Most of what was found were Jack Ridley Jr., director of CNAD, works from 72'-78'. The addition of conducting interviews and working with people who were involved with the program, will construct a better understanding of this program and its center in its time and place. Although the program had closed, the efforts to offer programs similar to CNAD continue to breathe life into indigenizing the academy.

Presenter(s): Alexandra Gomez

Indigenous Maternal Pedagogy and Indigenous Early Education Teacher Mentorship

Indigenous early education programs are one of few of the educational arenas where Indigenous mothers can create radical spaces to facilitate empowering cultural practices and reclaim the education of their children at the most critical period of their development. In Indigenous communities it is common to find more Indigenous women teachers, mostly mothers and "other mothers" via a form of motherwork or linguistic motherwork (Hill-Collins, 1994; Ek et. al, 2013) employed in tribal early education programs than in tribal K-12 schools. Indigenous mother-teachers are in a unique role as tribal language keepers, cultural carriers, leaders, and protectors of their children. Often, these mother-teachers are learning their language and culture alongside their children as Indigenous ECE programs are prime points for awakening Indigenous languages. Mentoring early education teachers in Indigenous early education can be viewed as a healing practice in which issues of leadership, relationships, capacity building, and interactions shape how teachers engage with each other and their students to connect with land, the children they teach

and their families, and the language and culture as a way of (re)building Indigenous nations. This paper explore how mentoring teachers in Indigenous early education programs differs from mentoring, or coaching, in mainstream settings and how the former can be applied through the lens of Indigenous maternal pedagogy and motherwork/linguistic motherwork.

7904 Katrina's Ghost's

Start Date: 11/21/2025 2:30 PM **through** 11/21/2025 4:00 PM

Venue: Sheraton **Room:** Napoleon BR C2 (3rd fl)

Type: Roundtable/Town Hall

This roundtable/town hall explores the enduring legacy of Hurricane Katrina in cultural anthropology and adjacent fields. Katrina's aftermath continues to shape critical debates on the racial, economic, social, and political dimensions of environmental disaster and climate change. Presenters will examine how Katrina's presence in scholarship is both foundational and limiting-at once a singular historical event and an imperfect stand-in for global experiences of environmental crisis. We ask: How do we write and think with Katrina? What does it mean to depart from it-and why? What did Katrina open up in critical debates about environmental justice, climate change, and racial inequality? How has it shaped ethnographic approaches to displacement, migration, social and environmental justice, and resistance? Discussants will also reflect on the challenges of using Katrina as a framework for studying environmental disaster beyond Louisiana and the U.S.

7376 Between Remains and Aspirations: A Spectral Imagination of Everyday Democracy in India

Start Date: 11/21/2025 2:30 PM **through** 11/21/2025 4:00 PM

Venue: Sheraton **Room:** Napoleon BR C3 (3rd fl)

Type: Oral Presentation Session

How are everyday elements of a democratic nation conjured from the past? What are the different ways in which a thing of the past – the history, a memory, a souvenir, or a piece of nostalgia, mobilized to serve as a building block in the making of a nation? How do the relations between the State and society present itself as a palimpsest of the past but also a desire for an idealistic future? This panel will attempt to answer these questions by drawing attention to the quotidian forms of

democratic engagement in the Indian context. Building upon Habermas's notion of the 'public sphere' (Habermas, 1992) and Chatterjee's conceptualization of the 'political society' (Chatterjee, 1993), this panel will pay specific attention to everyday spaces, objects, conversations and medium(s) in and through which the society interacts, negotiates, interrogates, argues and reconciles with the State. Reflecting and borrowing from the past is not merely romanticisation but a strategic and deliberate project to enable as well as foreclose specific narratives and possibilities in a democracy. Thus, the goal of this panel is to highlight the routinised and ordinary modes of democratic engagement by outlining the continuity and ruptures between the past that lingers, the present that exists and the future that is approaching in India.

Presentation(s): Youth of the Nation, Ghosts of the Past: Memory and Majoritarianism in Ahmedabad

This paper examines young people's experiences in relation to their nationalistic and political attachments in the city of Ahmedabad in Gujarat, India. The present-day idea of India as a nation, built upon a majoritarian religious discourse, has begun permeating everyday spaces, objects, and conversations over the last decade. This has resulted in a routinized yet widespread idea of the discourse, that scholars are referring to as a 'banalization of Hindu nationalism' (Jafferlot, 2018). As the crucible of this discourse, children and youth are being entrusted with the responsibility of disseminating and reproducing these ideologies in and through everyday practices and ways of being. Drawing from notions of 'child-in-the-future' and the 'future-in-the-child' (Sheldon, 2018), this paper will demonstrate how ideas about the nation, that appeases a specific politico-religious ideology, are disseminated across generations through the medium of memories. I will demonstrate how the art of storytelling, the performative delivery of speeches and the curation of digital content are some of the ways through which affective attachments to the nation are manufactured, revived, and projected onto the future generations. Thus, this paper will argue how the past is invoked not only with the goal of contouring the present version of the right-wing ideology but also in reinscribing an idealistic future – one that can be led by the youth of the nation.

Presenter(s): Anusha Iyer

Inherited Stigma, Claimed Futures: The Everyday Politics of Banjara Youth

My paper explores how historically nomadic communities, upon their sedentarization, navigate and negotiate with modern democratic institutions in their everyday lives. Focusing on the Banjaras of Hyderabad, Telangana—one of many communities classified as 'hereditary criminals' under colonial rule—this ethnographic study examines the afterlives of criminalization and the uneven

processes of state recognition in postcolonial India. Although independent India formally dismantled colonial laws such as the Criminal Tribes Act of 1871, the legacies of surveillance and marginalization persist in subtle ways. Through fieldwork with two youth-led collectives, Girijana Shakti and Girijana Aikya Vedika, this paper traces how Banjara activists engage with the state—not merely as subjects of policy but as agents shaping its everyday enactments. I argue that these everyday forms of democratic engagement are often made possible through invoking things of the past, memory, identity, and the residues of colonial governance. In doing so, the paper contributes to anthropological debates on the state, political subjectivity, identity, everyday life, and the experience of marginality.

Presenter(s): Manohar Boda

The Spectre of Politics: Debt, Democracy and Power in Indian Cooperatives

Urban credit cooperative societies have become a ubiquitous part of urban credit markets in India. In India, credit cooperatives operate as democratic associations, albeit regulated and supported by the state. Off late, narratives of crisis saturate discussions of credit cooperatives, and at the heart of this crisis are spiralling loan defaults. Moral diagnoses of these loan defaults address one cause in particular - 'politics' - which is opposed to 'professionalism' as criteria guiding loan distribution. Invoked as a remnant of an 'old India' that haunts an 'emerging market' (Kaur and Hansen 2016), this talk of politics is a symptom of the peculiar anti-politics that haunts Indian democracy. My paper will examine the concepts and practices that these narratives of 'politics' invoke in diagnosing the crisis haunting cooperatives. In this narrative, the pervasiveness of 'politics' is sought to be replaced by a technocratic 'professionalism', with the latter apparently based on merit and economic efficiency. This narrative resists implicating caste in diagnosing debt defaults. In fact, caste (of the upper castes) is seen as constituting productive forms of social and cultural capital. With this, I demonstrate how the narrative of 'politics' shapes a social imagination of state and the public in India, making associations like cooperatives a site of "a political struggle in caste terms" (Witsoe 2011).

Presenter(s): Shantanu Nevrekar

Spectral Nationalism: Reimagining India through Everyday Encounters of Unbelonging

Democratic imagination in contemporary India is not primarily constructed through grand political narratives, but through what transpires in the most mundane and intimate spaces of everyday life. Drawing on multi-sited ethnographic fieldwork with Rohingya refugees in India between 2023-2025 with diverse interlocutors— neighbors, family members, journalists, community leaders, and local activists—I trace how the spectral promise of "Vishwa Guru" materializes through seemingly disconnected fragments of social experience. The margins of my research reveal a complex topography of national becoming: from digital surveillance of civil society to the ritualistic demands of the Ram Mandir, from censorship's quiet suffocation to the architectural reimagining of the Central Vista project. Conversations about nationalism, filtered through hardened positions on identity politics, internal armed conflicts, Hindu-Muslim coded performances, Bollywood

narratives, casual casteism, and the systemic marginalization of "undesirables" like the Rohingya, became sites of intense negotiation. My paper will trace these spectral formations by analyzing how seemingly disparate elements collectively produce and simultaneously fracture this not-so-new imagination of national belonging. Through these quotidian processes, I aim to illuminate the subtle mechanisms through which democratic ideals are being negotiated, contested, and reimagined in contemporary India.

Presenter(s): Ankita Chandranath

Moving Spectres: Bicycling and Childhood in Urban India

State governments in India have actively presented bicycle distribution programs as enablers of adolescent children's socio-economic and educational mobility and democratic participation, including in urban areas. The paper will explore how childhood discourses influence bicycling as a form of transport and leisure in Chennai and Delhi (India). I draw from mixed-methods qualitative research in the two cities (as a part of a multi-institutional research project) to ask: What is the place of bicycles in these cities? How are they associated with childhood and adolescence? How do specters of bicycling and childhood shape each other in South Asian cities? What possibilities and limitations does this association produce for children's and bicycles' democratic participation in the urban public? I will read the marginal place of bicyclists within road transport planning against their complex everyday negotiations on the road to critically interrogate the imaginary of the bicycle as a transitory, 'adolescent', and liminal form in the pathway to aspirational automobility for both the city and the children. I analyze the associations between childhood and bicycling as moving specters composed of fond nostalgia, age-appropriate mobility, and fear of traffic crashes.

2379 Sites of Violence, Mobilization, and Resistance in Contexts of Political Violence and Authoritarian Rule: the Cases of Colombia and Turkey

Start Date: 11/21/2025 2:30 PM **through** 11/21/2025 4:00 PM

Venue: Sheraton **Room:** Napoleon BR D1 (3rd fl)

Type: Oral Presentation Session

In this oral presentation session, we focus on how people and communities promote mobilization, community organization, and resistance amid authoritarian rule, state repression, and other forms of political violence. The papers in this session ask: What forms do mobilization and resistance take when states tighten their grasp on everyday life through surveillance, coercion, and environmental destruction? How do people enact politics amid violence, dispossession, and entangled operations of state and non-state armed actors, as well as market forces? Where do people go when paths of resistance, mobilization, and justice are blocked?

The presentations draw on cases from Colombia and Turkey to illuminate these questions. In Colombia, following the 2016 Peace Accord between the government and FARC guerrillas, different forms of political violence have persisted, including state repression during national strikes and forms of control and violence by non-state armed actors in various territories of the country. In Turkey, with the increasingly autocratic rule of President Erdogan, dissent is severely surveilled and criminalized, curtailing when and where resistance can take place.

We analyze how dynamics of collective action and political agency are shaped across urban and rural settings through the work of diverse grassroots actors such as: Campesino communities in rural Colombia organizing to navigate the presence of illegal armed groups, revolutionaries in urban Istanbul engaging in choreographed protest, grassroots activists and families in Cali who participate in a People's Tribunal, and middle-class urban-to-rural migrants in Turkey mobilizing around ecological futures.

We consider the varied forms that resistance and community organizing can take, from overt forms of collective actions such as protest, confrontation, and local mobilization to more everyday practices like public mourning, ecological production, and improvisational organization. We foreground a wide array of repertoires and modalities of creative, collective, and embodied practice. By tracing these expressions of collective action, we explore how grassroots actors grapple with and redefine the limits and the meanings of mobilization, resistance, and political agency in hostile and unstable contexts.

Grounded in long-term ethnographic commitment, the papers in this panel scrutinize the everyday textures of struggle-disillusionment, improvisation, endurance-as well as the affective and ethical dimensions of collective action.

Presentation(s): Navigating Post-Peace Accord Violence: Organizational Processes and Resistance in Rural Communities in Montes de María, Colombia

In 2016, the Colombian government and FARC guerrillas signed a peace accord to end more than 50 years of armed conflict. However, in the region of Montes de María, the post-accord context has been characterized by the reconfiguration of the presence of non-state armed actors and forms of political violence against social leaders, ex-FARC members, and rural communities. The Autodefensas Gaitanistas de Colombia (AGC), a non-state armed group that emerged after the demobilization of paramilitary groups in 2005, expanded its presence to the municipalities and rural areas of Montes de María in the post-accord period.

This paper examines forms of organization and resistance promoted by campesino communities to navigate and respond to the attempts of control and violence associated with the presence of the AGC in the territory. Some campesino communities have relied on their organizational processes to oppose the presence of non-state armed actors, local mobilization to demand security and compliance with the peace accord, and more subtle forms of resistance. Community organization and less overt forms of resistance have acquired prominence in a context where some regional and local state actors have denied or minimized the presence of illegal armed groups or have been unable to provide effective and long-term responses to this situation. However, the presence of these armed actors and increasing violence are also impacting organizational processes in rural communities.

Presenter(s): Diana Hoyos-Gómez

Cop Per Capita: Anticipation, Absence, and the Choreographies of the Street in Urban Turkey

In Candere, a working-class district in Istanbul with a history of leftist mobilization, protest unfolds through calculated choreographies of confrontation. Based on three years of ethnographic fieldwork, this paper examines how revolutionaries organize demonstrations through the lens of anticipated repression. I develop the concept of Cop Per Capita (CPC) to describe how activists evaluate police presence—predicting state response based on past patterns, calibrating tactics accordingly, and reading shifts in CPC as indicators of the state's political sensitivity. In this context, repression becomes a necessary component of protest's political legibility: arrests and clashes serve not only as obstacles but as confirmation of struggle. When the police fail to show up, as in a 2022 demonstration against poverty, revolutionaries experience not relief but uncertainty. Without confrontation, the protest risks feeling unfinished—its force diluted by the absence of state response. Drawing on the choreographies of street politics, I argue that authoritarian governance in Turkey not only constrains what is possible, but also structures how dissent becomes meaningful. Protest in Candere is not simply oppositional; it is a performance shaped by state anticipation. Through CPC, I track how endurance, spectacle, and disruption converge in a political landscape where even absence can signal abandonment.

Presenter(s): ilkim karakus

Mournful resistance: The People's Tribunal of Siloé and the Struggle for Justice After Colombia's 2021 National Strike

In 2021, Colombia experienced massive protests during a national strike, which were met with violent state repression, leaving over 60 people dead. Cali's commune of Siloé became a critical epicenter of this violence, suffering at least 16 fatalities. Facing an inefficient justice system, community members organized a People's Tribunal as an act of symbolic justice—gathering testimonies and evidence to present before an international panel of jurors. After the jury delivered its ruling, victims' relatives continued to meet and work together, demanding justice and constructing an alternative account of the 2021 national strike.

This paper explores how the People's Tribunal's creation of the Garden of Life and Memory in Siloé serves as a powerful form of collective mourning and political resistance. By publicly grieving, naming, and memorializing victims of police violence, the Tribunal challenges the state's uneven distribution of grievability, which renders some lives disposable and unworthy of remembrance. This mournful politics does more than demand accountability for the events of the 2021 national strike—it actively contests long-standing historical and structural violence. Moreover, through everyday practices of care, encounter, and communal labor, the garden fosters a political community rooted in shared vulnerability, interdependence, and affective solidarity, redefining political engagement beyond traditional protest and advocacy.

Presenter(s): Ana Marrugo Gómez

Farming Against the Grain: Ecological Experimentation in Authoritarian Turkey

In contemporary Turkey, urban-to-rural migration has taken on a new political meaning as educated, secular professionals turn to ecological farming and alternative food networks to resist both environmental degradation and authoritarian rule. Based on 18 months of ethnographic fieldwork with back-to-the-landers, this paper explores how aspirations for agroecological transformation unfold through fragile experiments in collective living and production. I argue that these projects constitute deeply ethical attempts to reimagine relationality, value, and livelihood in a context where conventional forms of political action are foreclosed. Drawing on scenes of subtle confrontation—whether with institutional neglect, extractive market forces, or internal failures of solidarity—I examine how participants navigate disillusionment, cultivate new forms of care and responsibility, and confront the limits of their transformative dreams. Rather than locating resistance solely in visible defiance, I trace how the mundane work of growing food, conserving resources, and managing disappointment becomes a terrain for moral and political struggle.

3903 Development as a ghost: Anthropology of becoming in the age of global decoupling

Start Date: 11/21/2025 2:30 PM **through** 11/21/2025 4:00 PM

Venue: Sheraton **Room:** Napoleon BR D2 (3rd fl)

Type: Oral Presentation Session

Seductive and powerful, development is one of the defining ideas of our time. Its operative categories are presented as rational and immovable, until moments of crisis when "all that is solid melts into air." Through the ethnographic approach to developmentalist interventions, anthropology has long shed light on the lives lived in the aftermath of progressive schemes with their illusory trappings of inexorability and permanence. If development effects change by creating its others, then what, we ask, are people left with when purportedly coherent, universalist ideas – and the political, social and moral communities forged under their aegis – fracture into fragments? This panel invites consideration of development itself as a ghost that animates various conditions of "post"-ness, from postsocialism to post-colonialism and indeed the current moment of global

decoupling. Shaoyu Tang begins the discussion by examining how narratives of local resilience among residents of the post-industrial northeast of the country compete with a state-level insistence that the region is past its best and needs a "renaissance." By contrast in southeastern Kazakhstan, Ed Pulford discusses a community consciously renouncing "national" categories alongside other markers of externally ratified identity. The mobile ethnic pasts of the Sinophone Dungan community offer post-Soviet, Muslim, Chinese, and other referents to hitch "identity" to, but some younger Dungans seek relationally "clean" lives free from the vestiges of these troublesome categories. Yaru Yang's paper examines the racialization process as it emerges through everyday linguistic practices in Kenyan-Chinese encounters in today's Nairobi. These transnational communicative acts reflect an entangled inheritance of divergent colonial legacies and broader ideological formations. Tracing how interlocutors use, interpret, and contest inherited categories, the paper shows how language becomes a site of ambiguity, negotiation, and emergent knowledge amid fragmented ideological residues. Where developmental and civilizational hierarchies are concerned, Ruiyi Zhu's Mongolian interlocutors have deep experience of navigating the planned structures and unplanned aftermaths of totalizing cross-border schemes. The postsocialist economic success of the mining town Bor-Undur emerges as a context haunted by ghostly narratives of extraction vs. contribution, Soviet and Chinese development, and the Janus-faced promise of enrichment and exploitation. Finally, Ruslan Yusupov's paper examines how the Chinese government maims mosques which were until recently been promoted as the very symbols of integration of Islam with the Chinese civilization. Ruslan shows the campaign to be an exercise in the racialization of progress which effectively makes Sinophone Muslims guilty of their past development and urbanization.

Presentation(s): Outdated or Unfailing?: Contesting "Renaissance" and "Crisis" through Refashioning Ma Dashuai in contemporary Northeast China

China's postsocialist market reform has turned Northeast China, once an honorable industrial center, into an "outdated" region that embodies the petrified socialist past. A recent trend of transmedial storytelling, celebrated by scholars and local elites as the "Northeast Renaissance," has transmitted past trauma and memory as spectacles and media landscapes in popular culture. However, my Northeastern interlocutors criticized such Renaissance discourses and articulated, "Northeast China does not need Renaissance in that it has not been outdated." This ethnographic study shows how Northeastern people interact with Ma Dashuai, a television drama made 20 years ago in Northeast China, to come to terms with their postindustrial past, reckon with cultural

authenticity, and imagine a prosperous future. I theorize the slippages between concepts of "Renaissance" and "unfailing" to examine the role media plays in re-making historical subjects in post-reform China. It reveals a complex storytelling that moves the deindustrialized Northeast China from the nation's periphery to the center. My analysis shows how the spectre of the nation-state, whose market reform policy "abandoned" Northeast China, is conjured up by Northeastern people. Through refashioning Ma Dashuai, they refuse the idea of "outdatedness" and imagine an unfailing Northeast China. As such, I argue that theorizing "outdated/unfailing" reveals the central role nationalism plays in the making of Northeastern subjectivity.

Presenter(s): Shaoyu Tang

Exorcising modernity: Detached aspiration among a Dungan collective farm diaspora

Subject to decades of state projects to root them in place, Kazakhstan's Dungan people navigate ghostly layers of "identity" and "usable" ethnic pasts like many communities across the post-Soviet canvas. Yet as Muslim speakers of one specific regional Chinese language, the dispersed residents of former-collective farm (kolkhoz) land in southeastern Kazakhstan have more potential reference points than most when asked by fellow citizens or social scientists: "who are you?" Kazakh, Soviet, Chinese, Russian, Shaanxi, Muslim and Silk Road coordinates may all feed into a partially satisfying response. But while questions of this group's 'origins' or 'belonging' circulate in both scholarship and daily conversation, my research suggests that – haunted by modernist attempts to make them 'legible' – some younger Dungan men are today adopting a future-ward gaze which seeks detachment from these retrospectively-tinged categories. Against a vogue for situating origins or belongings, contemporary Dungan aspiration draws on a polysemous combination of economic advancement, religious traditionalism and a spatial scope which strings together hub locations in Central Asia, Russia and China. All these sites have a place in narratives of Dungan histories, but their mobilisation in the present suggests dissociation from the taxonomical trappings of codified ethnic identity.

Presenter(s): Ed Pulford

From "Black" to "Local", from "Mzungu" and "Ching-chong" to "Mchina": Language and the Making of Race in Everyday Chinese-Kenyan Interactions

How do colonial and global ideologies of race play out in contemporary encounters between Chinese and Kenyans, both subjects historically 'racialized' by overlapping but distinct colonial histories? This paper explores the evolving linguistic practices in everyday Chinese-Kenyan interactions in Nairobi, offering an alternative view of Chinese presence in Africa beyond geopolitical and economic framings. Based on 13 months of fieldwork, it examines how people refer to and address each other using shifting terms—such as "Black" to "Local," or "Mzungu" (white person) and "Ching-chong" to "Mchina"—that reflect historical residues and ongoing negotiation. Drawing on race and language as social processes rather than fixed categories or products, the study highlights how meaning is both expressed and interpreted—shaped by divergent colonial legacies and broader ideological formations, including African-American civil rights discourse,

Chinese socialist rhetoric, and global racial imaginaries. These influences inform how people make sense of themselves and others amid transnational mobility and everyday asymmetries of power. Moments of linguistic misalignment are not simply sources of confusion, but opening for reflection, negotiation, and learning. In such moments of friction and ambiguity, people alter terms and meanings that reflect, contest, and unsettle inherited racial imaginaries—making language a dynamic site of racialization, power negotiating, and knowledge-making.

Presenter(s): Yaru Yang

The Soviets departed, but the mine remained: A spectral analysis of extractive development in eastern Mongolia

Mongolian industrialization in the 20th century bears indelible Soviet marks. Established in 1973, Bor-Undur was not only the site of the first Mongolian-Soviet joint mining company, but also the embodiment of the Soviet design for a company town. As the Soviet presence started dwindling in the 1990s, the infrastructure of this town remained — its abandoned apartments were redistributed to local Mongolians who embraced privatization, while the mine, nationalized in 2016, continues to thrive. The recent influx of Chinese investment has breathed new life into Bor-Undur's mining sector. When compared to the Soviets, the Chinese were perceived as less generous, bringing capital, labor, and machinery from China and siphoning profits back at home. This paper employs Gregory Delaplace's (2012) insight into the spectral narratives around Russian and Chinese presence in Mongolian urban legends to analyze these two contrasting developmental models. How does a provincial town, eager for progress, navigate entanglements with two significant Others? Does the promise of extraction bring hope or spell doom? Drawing on ethnographic interviews and archival research conducted in 2024, this paper offers a spectral lens to examine the entwined narratives of aspiration and discontent that shape Bor-Undur's evolving identity.

Presenter(s): Ruiyi Zhu

Racializing Development: "Arab Style" Mosques and the Logic of Sinicization in Contemporary China

Since 2018, thousands of mosques across China have witnessed their domes and minarets beheaded and amputated. The changes are due to the nationwide campaign of "Sinicizing" Islam that the government sees as exhibiting the so-called "Arabization" and "Saudization" trends. Drawing on ethnographic fieldwork and classified documents, I show, however, that the so-called "Arab style" mosques emerged in China in response to urban renewal and redevelopment schemes. Like various Sohos, Beverly Hills, Amsterdams, and Thames towns that mushroomed in China at the turn of the century, they too projected affluence, progress, and fine living of Sinophone Muslims in Chinese modernity. They became the embodiments of multicultural integration in the age of reform economy. What Sinicization finds threatening, therefore, is not the "foreignness" of Chinese Islam as its uncanny ability to integrate itself into the body of the nation. By casting the Reform-era progress as evidence of "Saudization," the campaign effectively makes Chinese Muslims guilty of modernization and urbanization. It thus seeks to reduce Muslims back to the official stereotypes

that the Party-state holds about them, thereby producing sociopolitical impotence as the definition of what it means for Muslims to be Chinese today.

7841 The Spectre of Affirmative Action & DEI in the Trump Era: A Year One Status Update

Start Date: 11/21/2025 2:30 PM **through** 11/21/2025 4:00 PM

Venue: Sheraton **Room:** Napoleon BR D3 (3rd fl)

Type: Roundtable/Town Hall

What haunts anthropology and our institutions is not just what was denied, but what was promised by decades of legislation and policies that seemed to codify gains made by social justice movements. On January 20, 2025, President Trump began signing a series of executive orders that attempted to position diversity, equity, and inclusion (DEI) programs, initiatives, and activities as illegal on the grounds that DEI is "discriminatory." Positioning DEI as discriminatory at the federal level has had a number of interconnected impacts, from bolstering the ongoing uptick in state-level anti-DEI legislation to exacerbating popular misconceptions of DEI in the popular imaginary throughout the United States.

As the language of DEI has become more commonplace, we also see the echoes of earlier social justice and affirmative action efforts, for better and for worse, still lingering in DEI and DEI-related policies, perceptions, and practices: the spectral presence of the murder of Emmett Till and George Floyd, the Stonewall uprising, claims of reverse discrimination, the silencing of human rights protests, and the legal erasure of transgender people. These legacies persist in current DEI efforts in ways that can be counter-productive and demoralizing in some cases and yet productive and inspiring in others.

Almost one year since the executive orders have been signed, this panel convenes graduate students, faculty, and industry professionals from various states in the country to provide a status update on the successes and failures of anti-DEI efforts, collective resistance strategies, and new pathways forward. In particular, panelists will reflect on how responses and resistance to anti-DEI executive orders have taken shape within, by, and against institutions; what strategies have worked; and what strategies have not. They will grapple with questions about the ghosts that have been encountered in the process of resisting and how these ghosts have facilitated resistance or made it more challenging. Panelists will also report on what has been lost and gained in resisting anti-DEI efforts and the hope that remains for building more inclusive and equitable futures. Ultimately, through layered conversation across roles, sectors, and generations, this session seeks to give voice to the unfinished business of DEI in social justice efforts and envision pathways forward that eschew symbolic gestures in favor of sustained, systemic change.

6983 Mines, Microbes, and the Making of Value

Start Date: 11/21/2025 2:30 PM **through** 11/21/2025 4:00 PM

Venue: Sheraton **Room:** Nottoway (4th fl)

Type: Oral Presentation Session

In 1980, the landmark U.S. Supreme Court decision in *Diamond v. Chakrabarty* enabled the patenting of living organisms, opening the door for the commodification of life. Although the case involved a bacterium capable of breaking down crude oil, research exploring the forms of value created through this new legal structure has largely overlooked the extractive industries, focusing instead on biopharmaceuticals and genetically modified crops. Yet since that decision (and, in some cases, before it), oil, gas, and mining companies have extensively used and/or patented a wide range of bacteria, yeasts, molds, and fungi to facilitate their operations. Often marketed as "nature-based" and therefore "eco-friendly," these biotechnologies raise questions about their capacity to disrupt-or entrench-the extractive logics from which they emerge. While anthropologists have turned increasing attention to microbial life in sites such as the human gut, garden soil, oceanic currents, and even extraterrestrial speculations, the microbial actors entangled in extractive zones remain understudied. This panel brings extractive industries into closer conversation with the growing literature on microbial life, examining how microbial worlds attend extractive processes.

Presentation(s): Microbial worlds beyond worlds: Extracting value from/through/with/in microbial biotechnologies in space

In zero-gravity environments, up and down are a matter of local convenience, if they are recognized at all. Without a shared center of gravity, with fewer socioenvironmentally stabilized cues and constraints about how to orient one's self in space, a wider range of potential perspectives can be recognized as potentially reasonable. I want to talk about microbial biotechnologies for extracting resources in space—in part because the reasonable, appropriate, or most useful frames of reference for describing them are less codified than complementary cases anchored in earth's gravity well. In doing so, I am compounding an affordance (and challenge) of studying microbes

generally, especially microbes that dwell beyond human bodies: neither the units of analysis for describing relations nor the social roles of those relata are obvious or pre-scribed. Inspired by Strathern's mode of redescription, I will outline how microbes are being developed to extract more and different kinds of value from the moon, Mars, and astronauts, to investigate what perspectives might be taken on how creatures, roles, value, and values are enacted in these cases. I do so through a material-semiotic-energetic framework, recognizing that all things can be described in terms of physical, discursive, and energetic dimensions, to investigate whether and how it might be useful to question distinctions between resource and resourced, extractor and extracted.

Presenter(s): Erika Szymanski

Oil-Eating Microbes in the Soviet Union: From Party-State Utopia to Ecological Protest

From the early 1960s through the end of the 1980s, the Soviet Union undertook a wide-ranging effort to produce dietary protein supplements by growing yeast on hydrocarbon feedstocks in massive industrial fermenters. This paper looks in on the industrial metabolism of oil-eating microbes in a non-capitalist context that nonetheless responded to the global political economy of food, oil, and biotechnology of the time. The paper pays special attention to the end of this era in the Soviet Union. In the late 1980s, a series of spills and accidents at a biochemical plant producing microbial protein sent a mix of yeast, hydrocarbons, and other elements of industrial fermentation into the environment of Kirishi, outside of Leningrad. The subsequent citizens' ecological protests mobilized not only a familiar imagery of devastated human bodies—especially children—but also a larger imaginary of microbial growth, spread, fermentation, and infection. As scattered protests turned into a USSR-wide movement, newly ecologically aware citizens transformed a microbial imaginary that was originally developed in the service of a socialist utopian future into a mobilizing tool directed back against the party-state. Oil-eating microbes did not end the Soviet Union, but we may want to give them—and the humans and larger forces that gathered around their metabolism—more of a role than we have.

Presenter(s): Douglas Rogers

On Mushrooms, Petrochemicals, and Remediation in Ecuador's Oil Frontier

In northern Amazonian Ecuador, where decades of oil extraction have devastated the environment, affected communities are exploring how to harness the digestive systems of fungi to break down the recalcitrant bonds of hydrocarbons. Unlike industrial remediation methods, which aim to return to a prior state by reducing total petroleum hydrocarbon levels, these grassroots projects more expansively seek to repair relations fractured by extractivist logics. They emerge from an understanding of repair as a process that moves through distinct stages: from contaminating relations, to non-contaminating relations, to decontaminating relations, to, ultimately, enriching relations. Here, mushroom mycelia become agents of a prefigurative politics, helping to cultivate a collective affect and ethical disposition—what I call multispecies joy—that is oriented toward preventing future harm.

Presenter(s): Lindsay Ofrias

Dwelling in technoscientific bioremediation

Research on technoscientific practices concerning the more-than-human, such as microbes, has focused on microbial extraction and valuation for capital accumulation in/from laboratory settings. Broadening the scope of scientific microbes beyond valuation and the lab, this paper investigates scientist-microbe relationality in the practice of bioremediation, a technoscientific, nature-based solution. Applying ethnographic fieldwork, interviews, and scientific reports on bioremediation, I argue that the outdoor environment of the scientific fieldsite, as opposed to the laboratory, enables a mode of involved relation that affects how scientists approach the microbes they work with and shapes the practice of bioremediation. This paper highlights the possibilities for the technosciences to move away from fixity on microbial commodification and capital gain to reorientate towards alternative systems and forms of technoscience.

8753 Anthropology and Environment Society Board Meeting

Start Date: 11/21/2025 2:30 PM **through** 11/21/2025 3:30 PM

Venue: Sheraton **Room:** Oak Alley (4th fl)

Type: Special Event

This will be the annual board meeting for our section.

3737 The anthropology of reparations

Start Date: 11/21/2025 2:30 PM **through** 11/21/2025 4:00 PM

Venue: Sheraton **Room:** Rhythms I (2nd fl)

Type: Oral Presentation Session

Reparations are among the most important political and economic claims of the twenty-first century. They tend to be made during and after wars, terrorist attacks and major moments of institutional violence, and they increasingly feature in calls to address the ghosts and legacies of colonialism, slavery and genocides. In recent decades, reparations have also been claimed by various minority groups, and they are invoked to address today's most pressing social and environmental problems, including climate change, large scale pollution and poisoning, famines, and infectious disease outbreaks. This panel compares reparations claims and programmes in new and understudied contexts. It asks how the anthropology of reparations should develop in times when the ghosts of the past continue to haunt us and reparative claims multiply.

Discussant: Barbara Rose Johnston, Center for Political Ecology

Presentation(s): Reparations payments worldwide

This paper contributes to the emerging field of reparations economics by providing a new and comprehensive overview of the global reparations landscape. It does so by presenting a dataset of major reparations payments made since World War II, a turning point in the history of reparations. The dataset encompasses both domestic and international payments, and includes reparations made by and to states as well as non-state actors. Through an analysis of the data collected, this paper highlights key global and regional trends in reparative payments and asks what kind of an economic force reparations represent worldwide.

Presenter(s): Geraldine Ramilo

Valuing Risk and Responsibility: The Calculative Grammars of Compensation

Legal systems of compensation are tasked with translating concrete harms into abstract sums of money, and in doing so, determine who is responsible for harm, to what extent, and what form restitution should take. These forms of reparation or compensation work to recognise harm, facilitate claims for justice, and redistribute resources to those who are harmed. In this paper, I draw on sixteen months of participant observation with social movements negotiating a state social security programme that compensates workers affected by occupational lung disease in northwestern India. I describe how two social security programmes operated in tandem, valuing the same injury differently based on the documentary evidence affected workers could gather. By attending to the technical and calculative forms through which injury is diagnosed and compensated for, I argue that the form that reparations take encode moral and ethical values that differentially value life in economic terms. This draws attention to how claims to reparation are transformed into bureaucracies of redress, the moral values that undergird and legitimate them, and the broader political economy within which compensation claims are embedded. I close by considering what lessons this might have for new reparations demands that emerge within transnational contexts and by critically reflecting on the place of compensation within demands for justice.

Presenter(s): Shruti Iyer

Responsibility and reparations for cholera in Haiti

This paper investigates the 2010 cholera outbreak in Haiti and the subsequent cholera response. It asks how responsibility was assigned to UN Blue Helmet soldiers from Nepal in the aftermath of the 2010 outbreak, how the UN avoided legal liability, and how discussions around responsibility for the outbreak shaped the subsequent epidemic response. Thereby the paper asks what pandemic outbreaks can teach us about the anthropology of responsibility and how debates about pandemic responsibility relate to broader attempts at obtaining restorative justice.

Presenter(s): Felix Stein

Repairing radioactive harm in New Mexico?

This paper considers reparations in the context of radiation exposure and its health and social harms in New Mexico, USA. While some reparative measures, including apology, compensation fund, and environmental cleanup efforts have been made, it is unclear how they have been experienced and perceived by affected people – both who have received and been excluded from them. The paper provides early ethnographic insights from research with radiation-affected people, including former uranium miners who provided raw material for US nuclear arms production and for the energy sector, 'downwinders' who were exposed to fallout from the world's first nuclear bomb test in 1944, and their descendants.

Presenter(s): Tabitha Hrynicky

Justice beyond reparation: Remembrance and future-making in the aftermath of the Sewol Ferry Disaster in South Korea

The sinking of the Sewol Ferry in South Korea on April 16th, 2014 claimed 304 lives, 250 of whom were students from Danwon High School on a fieldtrip. It quickly became clear that this was an utterly preventable tragedy, precipitated by neoliberal deregulation, dereliction of duty, and bureaucratic failure. More than a decade later, bereaved families and allied citizens continue to campaign for investigation, accountability, and the building of a safer society. For my interlocutors, the South Korean state's version of reparation, in the form of financial compensation in the early aftermath of the Disaster, was seen as a means to stifle their call for thorough, systemic change. It was the antithesis of the kind of justice they imagined. Justice and repair, in my interlocutors' activism, requires a look to both the past and the future: remembrance of the Disaster and its victims, and creation of a safer world in which no such tragedy befalls other families. This paper considers a justice claim that moves beyond the closure that reparation claims may entail, towards a more capacious understanding of justice.

Presenter(s): Sera Park

Rhetorics, realities, and climate reparations

This paper examines the evolving international relations between the Global North and the Global South through the concept of climate reparations. It focuses on the International Court of Justice's first-ever Advisory Opinion on the State's Responsibility to protect the Climate System issued in 2025, and its impact on global climate negotiations, with a focus on the small island developing states (SIDS). Drawing on from socio-legal scholarship on climate reparations, the paper examines how reparations can become a political-economic catalyst in realising diverse forms of climate justices for the SIDS, despite the concept's operational limitations.

Discussion

4899 When Ghosts Knock: Anxiety and Care in East Asia

Start Date: 11/21/2025 2:30 PM **through** 11/21/2025 4:00 PM

Venue: Sheraton **Room:** Rhythms II (2nd fl)

Type: Oral Presentation Session

Echoing the 'spectral turn', this panel highlights the enduring presence of spectral beliefs and practices alongside dominant ideologies, offering a fresh perspective on their contemporary articulations in ritual and embodied practice.

This panel evokes the mixed blessing of the spectre's ongoing presence and its re-articulation in East Asia, approached through the counterbalancing concepts of anxiety (Zhang, 2020) and care (Kleinman, 2020). First, although a feeling of anxiety invokes the (re)emergence of ghosts, an unflagging desire to practice self-care and the ethics of care for others help soothe it away. Second, this panel taps into how people conjure up the rhetoric of the spectral and engage with the supernatural in everyday practices and eventful rituals to deal with and respond to increasing anxieties when living in a politically depressed and financially precarious era. As, such this panel retrieves affectively charged, unheard voices from the gaps of this structure, positioning 'anxiety' and 'care' into the shifting embodiments of spectral forces that reflect precarious realities in East Asia.

The mediumship of ghosts leaves us a research-worthy 'trace' (Derrida, 2017) to reflect on not only the alternating process of anxiety and (self)care in general, but also how they connect the living to the dead, humans to nonhumans and imagination and action. Instead of satisfying with the reduction of the spectral power to a rigid anxiety/care binary, we seek to salvage multiple unheard and unbearable voices from, between and in the gaps of the binary structure. This panel traces a trajectory from individual anxieties to the social repair found in self-care and care for others, mapping an affective spectrum from spectral symptoms to relational healing. Yang explores how Kinmen residents' anxieties of 'living-in-between' (manifested in encounters with 'unclean' objects like mainland waste and unrooted ghosts) reshape local negotiations of Taiwan's maritime borders. Fan examines how China's collecting craze reanimates the past through mediated storytelling, allowing both influencers and audiences to construct cultural identity and resist dislocation. Gao analyses late Qing Shanghai lithographs to reveal how female subjectivity was negotiated within the male gaze, highlighting gendered anxieties. Guo investigates heritage conservation in Mianzhu as both a trigger and remedy for anxiety, reflecting on its dual role as identity crisis and redemption. Li focuses on the storytelling of female shamans in Northeast China, showing how nonhuman agencies like animal spirits and ghosts enable self-empowerment and expose status anxieties. Finally, Qu explores how Chinese internet literature, as spectral imagination, allows readers to navigate uncertainties and assuage anxieties. Bringing into fruitful dialogue heritage studies, folk studies, history and anthropology, we approach the spectral interdisciplinarily.

Presentation(s): Navigating with "Unclean Things": Unrooted Ghosts and Drifted Waste on the Beaches of Kinmen

This paper explores the beaches of Kinmen to illustrate the "unusual" (im)material objects found in archipelagic borderlands. By examining everyday interactions with two kinds of "unclean things"—waste from the Chinese mainland and the 'ghosts' of soldiers who perished along these shores—I highlight how immaterial aspects of spirituality and local practices of living with "the haunted" become integral to residents' responses to the unexpected material "invasion" of waste and animal remains.

For decades, Kinmen's beaches have become repositories for waste from the mainland, carried ashore by currents and tides. This includes incidents such as dead pigs washing ashore during China's ASF outbreak and the ongoing influx of medical and household waste. While securitisation of these waste is typically understood as a method employed by Taiwanese authorities to assert sovereignty distinct from the PRC through everyday practices, Kinmen's residents often interpret these materials as unintentional or incidental encounters. However, by exploring local grassroots perceptions that intertwine responses to beach waste with interactions involving another 'unclean' presence—ghosts—I argue that even these seemingly unintentional encounters are underpinned by future-oriented anxieties of 'living-in-between', which actively 'making' local understandings of how Taiwan's maritime borders should or should not be defined.

The Ghost in the Cabinet: : Mediated Re-enchantment and Cultural Authority in Chinese Collecting Practices

This study explores how the past is reanimated as a "specter" in China's contemporary collecting craze, becoming both an absolute cultural authority and a means of self-empowerment. Amid the anxiety triggered by rapid modernization since the 1980s, collectors revive the past as an idealized standard to resist perceived cultural loss and Western-dominated modernity. Central to this process are opinion leaders—such as celebrity collectors and online influencers—who enchant the past by narrating personal encounters with objects, imbuing them with emotional depth, spiritual resonance, and historical destiny. Through these stories, mundane artifacts are transformed into vessels of memory and cultural meaning. Media platforms further amplify this affective authority, constructing a renewed traditional supremacy that resonates with nostalgic publics. Audiences do not passively receive these narratives; rather, they actively engage, emulate, and internalize the symbolic values conveyed. This process of mediated re-enchantment blurs the boundaries between private memory and national heritage, cultivating a participatory cultural field where

identity, value, and belonging are negotiated. By treating the past as a living presence, collectors and their audiences collaboratively shape a moral and aesthetic order that both challenges and coexists with modern paradigms of knowledge and authenticity.

Presenter(s): Juewei Fan

Fissures in the Gaze: Gender Anxiety and Women's Negotiated Subjectivity in Late Qing Shanghai Pictorials (1884-1912)

In the history of imagery, men's dominance in art enabled them to "gaze" at women, crafting idealized female images. This gaze not only disciplined women's identities, but also projected anxieties about preserving traditional gender structures. Since the late Qing dynasty, pictorials, aided by lithographic technology, became new popular media, reflecting Shanghai's urban modernity. Controlled by male creators, these pictorials still expressed female images within the constraints of the male gaze. As women entered urban spaces in the late 19th century, it also exposed gazers' fears of losing power: they tried to attempt a visual "exorcism" to fixate a vanishing gender world.

However, as commercial products, pictorials represent both artists' intentions and pressures from multiple fields. This allows a re-examination of the male gaze: artists, balancing subjective habitus with external pressures, reveal traces of real women. This paper introduces "negotiated subjectivity" to highlight this ghostly female presence in pictorials. These images become mediums of gender power anxiety and negotiation, maintaining male-dominated visual language while unconsciously yielding to female agency. Using Bourdieu's field theory, the study analyzes pictorials from 1884 to 1912 in Shanghai, exploring how the male gaze transforms through visual compromise, becoming a dialectic of male anxiety and female subjectivity, examining gender power dynamics in late Qing society.

Presenter(s): Zhiyue GAO

Heritage protection as 'redemptive formulas': the salvage and self-redemption of Mianzhu New Year traditions

The 'invention' of cultural heritage is usually linked to the 'past', attempting to 'salvage the essential, "authentic" self/selfgroup'. This 'redemptive' nature is understood as the pathway to revive the past and shape a better future by repossessing the lost past and reconnecting to the imagined homeland in modernity. This study explores how local authorities in Mianzhu have faced urgent economic and identity crisis of revitalization and urbanization, and tried to protect and activate the potential of the local traditional New Year ceremonies through cultural tourism development and heritage policy support. With bureaucratized performativity, excessive commercialization and homogenization have led to weakened local participation and poor tourist response, which heightened local uncertainty and mental concerns about the current and future situation. However, during the COVID-19 pandemic, the traditional New Year rituals have become daily rites to re-interpret the memory and self-identity of the local residents, which heals emotional trauma, alleviating loneliness, and strengthening senses of belonging. The heritage conservation thus

transforms from a rational tool for urgent salvaging losses to emotional and spiritual anchors within the community, which cures their experiences of rootlessness and rupture in the isolation period.

Women Empowered by Spirits: the Nonhuman Agencies in the Reshaping of Familial Power Relationship of Female Shamans in Contemporary Northeast China

The power relationship in contemporary Chinese families has experienced dynamic and profound transformations. Females' attempts to fight against status anxiety and enhance discourse power in the family can be observed from various perspectives. Resonating with this tendency and outside the attention of the mainstream, the contemporary female shamans in northeast China are continuously overcoming the status anxiety by reshaping and even reversing the traditional patricentric power relationship within their families by the means of appealing to the agency of animal spirits, ghosts, and deities of folk and institutional religions. In this context, the female shamans are not only empowered by the specters as spirit mediums channeling between human and nonhuman agencies but also as wives, mothers, and daughters claiming their position in families. This paper analyzes the empowerment of females with the agency of spirits from a folkloristic perspective by focusing on the female shamans' belief narratives about the involvement of spirits and ghosts in their family lives. The materials of this research are from my fieldwork interviews in northeast China. By understanding the world of the story-telling of the female shamans, the family domain is viewed as an ecology of other-than-human agency, where the intra-action between different agents, which lead to the partial collapse of patriarchic power, are demonstrated.

Presenter(s): Haozhen Li

Romance is Dead, Long Live Myth

Internet literature is a born-digital literary phenomenon in contemporary China. On literary platforms, writers typically publish and distribute their first 15-20 chapters for free as a literary 'gift' (Mauss, 2002) wherefrom writers then segue into the economic groove of the literary industry, expecting readers to subscribe for subsequent plots. This literary form has been recognised widely, albeit not necessarily approvingly, as a genre of romance. 'My favourite author is Weiyu, definitely. Her novels are short of cringy romance but full of ghosts and gods.' When I discussed with my interlocutor what kinds of internet literature she was looking for, I expected something more romantic but received something mythical. Later, I understand that what I assumed to be a deceptively personal taste turned out almost to be a literary trend in the coterie of internet literature readers. Why do readers shy anxiously away from romance but love myth? Why do readers prefer supernatural and extraordinary things over which our ancient master Confucius cast a veil? Inspired by the unexpected turn from my two-year fieldwork in China, I develop a theory of how the literary imagination of ghosts and gods promotes a sense of certainty and assuages a fear of the unknown in 'uncertain and precarious' China (Hillenbrand, 2023; Zhang, 2020). More broadly, this

paper expects to examine the social function of literary (re)imagination of the spectral force in China through the prism of anxiety.

Discussion

4748 Enduring Ethical Complexities in Research for Justice and Transformation

Start Date: 11/21/2025 2:30 PM **through** 11/21/2025 4:00 PM

Venue: Sheraton **Room:** Rhythms III (2nd fl)

Type: Roundtable/Town Hall

This session features an intergenerational and interdisciplinary roundtable discussion on research ethics in pedagogy, principle, and practice. Our discussant is the leading scholar of research ethics in anthropology, Rena Lederman, in conversation with fellow senior scholars and next generation thinkers. Presenters include authors of recent and forthcoming works on research ethics, critical theory, and collaborative research, including co-authors of a forthcoming book on research ethics for community-engaged scholars, entitled *Ethical Complexities in Research for Justice: A Companion for Engaged Scholars*.

Our conversation will focus on four interconnected themes:

- 1) Conventions of research ethics guidance in pedagogy and practice, and the limitations of procedural ethics conventions based on biomedical models and positivist science (as well as ghosts of colonial legacies and western paradigms);
- 2) The intersection of ethics and epistemology, with attention to important interventions from critical Indigenous studies, Black radical feminist tradition, and critical pedagogy;
- 3) How place, land, multispecies relations, and the communities we belong to and/or work with shape our ethics practice; and
- 4) Ethical motivations and implications of community-driven research, activist anthropology, and other forms of engaged scholarship for social justice and transformation.

We will intentionally weave intergenerational reflections, place, and community into our discussion. Senior scholars will reflect on the shifting terrain of politically engaged research and ethical praxis with community in their respective fields, while junior scholars will discuss how they are navigating the emergent present of assaults on higher education amid perseverance toward decolonial, abolitionist, and transformative research for justice. Indigenous scholars in the session will address the ethical and social justice challenges faced by Indigenous communities, and all participants will consider how research in North America and across the globe is shaped by systems of white supremacy, imperialism, and colonialism.

Our discussion will be grounded in story, with each presenter bringing stories to illustrate moments of learning and ethics in practice. Building on Lederman's recent commentary in *American Ethnologist*, this transdisciplinary conversation will consider how the next generation of anthropologists and scholars in related fields will be trained for engaging and enduring the political and ethical complexities of their changing work in a changing world.

8779 How to Search Like a Librarian: Systematic Search Skills for Professionals and Students

Start Date: 11/21/2025 2:30 PM **through** 11/21/2025 4:00 PM

Venue: Sheraton **Room:** Southdown (4th fl)

Type: Workshop

Have you ever been frustrated by the difficulty of finding relevant journal articles for a literature review? Are you interested in the searching techniques involved in systematic review or meta-ethnography? This workshop is designed to provide hands-on practice (bring a laptop!) with systematic searching techniques.

Led by a social sciences librarian, this session will cover advanced searching techniques such as creating concept tables, identifying controlled vocabulary, stemming, exploding terms, and locating search hedges. Attendees will see (and experiment with) how these techniques can be applied in AnthroSource, JSTOR, and any database on the EBSCO or ProQuest platforms. These are the techniques used by librarians conducting searches for systematic reviews, and can be useful for professionals and students who are interested in conducting systematic reviews or meta-ethnographies with or without the assistance of a librarian, and for anyone wishing to conduct more comprehensive and/or accurate searches in library databases.

To make the most of this workshop, bring a laptop or tablet that you can use to connect to your institution's library databases. Unaffiliated attendees who are AAA members will be able to search AnthroSource and JSTOR. Come with a research question or search topic idea so you can apply what you learn to a relevant area.

8743 Celebrating SANA at 35: Insurgent Anthropologies Then and Now

Start Date: 11/21/2025 2:45 PM **through** 11/21/2025 4:45 PM

Venue: Marriott **Room:** St. Charles (41st Fl)

Type: Special Event

Thirty-five years ago, right here in New Orleans, near one hundred people crowded into a 1990 AAA Annual Meeting room to demand the creation of a new section that would recognize the existence of an anthropology of North America. Angry and frustrated that their ethnographic research here "at home" was deemed outside the purview of anthropology, limiting their access to grants, publication opportunities, jobs, and professional recognition, they began to organize for change. In 2025, facing challenges both familiar and distinct, a new generation of anthropologists seeks to learn from the strategic efforts of SANA's past. How have SANA and its sister "insurgent sections" of the AAA shifted the intellectual and political landscape of the association, and of the discipline more broadly? What does SANA's legacy mean for our next steps and for the future of critical insurgent anthropologies? Join this roundtable of longtime SANA founders and builders to root our ongoing struggles in our shared insurgent foundations. Roundtable Participants: Lee D. Baker, Lindsay Bell, Sue Hyatt, Jeff Maskovsky, Ida Susser, and Maria Vesperi. Moderated by Angela Stuesse.

8614 Commemorating the Life and Work of Deborah Pellow

Start Date: 11/21/2025 3:00 PM **through** 11/21/2025 4:00 PM

Venue: Marriott **Room:** Beuregard

Type: Special Event

Friends, colleagues, and ex-students will come together to commemorate the life and work of Deborah Pellow of Syracuse University. Deborah was an outstanding urban anthropologist with extensive fieldwork in Ghana, and also served as President of the Society for Urban, National, and Transnational Anthropology, the predecessor to the Critical Urban Anthropology Association.

Many in SUNTA/CUAA have fond memories of her as an exuberant friend, mentor and teacher. We invite anyone who feels moved to join us in honoring her at this Special Event.

8835 Society for Visual Anthropology Robert Lemelson Fellowship Panel

Start Date: 11/21/2025 3:00 PM **through** 11/21/2025 4:30 PM

Venue: Marriott **Room:** Napoleon (41st Fl)

Type: Special Event

A special plenary panel during which the 2025 SVA Robert Lemelson Fellows present their research followed by audience Q&A.

9087 Nonportfolio Options Discussion

Start Date: 11/21/2025 4:00 PM **through** 11/21/2025 5:00 PM

Venue: Sheraton **Room:** Crescent (4th fl)

Type: Special Event

meeting to discussion nonportfolio options

8651 Student Council Reception

Start Date: 11/21/2025 4:00 PM **through** 11/21/2025 5:00 PM

Venue: Sheraton **Room:** Orpheus (8th fl) (access via elevator only)

Type: Special Event

Section Student Seats are invited to discuss the future of student representation and structure in AAA, concerns, requests, programs, activities and events. This is a catered event - invite only.

8656 Spirits, Stories, and Solidarity: Collaborative Ethnographic Encounters with the Mandingo Warriors & the Neighborhood Story Project

Start Date: 11/21/2025 4:00 PM **through** 11/21/2025 6:00 PM

Venue: Sheraton **Room:** Poydras (5th fl)

Type: Special Event

In an open-forum, we will discuss the ongoing collaborative projects of the past 25 years. The Mandingo Warriors are one of 90+ groups of Black Indians, found throughout Afro-American neighborhoods in New Orleans. Big Chief Victor Harris, who has made a new suit and masked for 59 consecutive years, is an innovative and accomplished leader and artist. Inhabited by "The Spirit of Fi Yi Yi"-an African Spirit Harris is an iconic figure in the life and culture of New Orleans. The discussion will focus on the collaborative nature of the long-term relationships and ongoing ethnographic/ photographic/ story-telling projects between the anthropologists (Neighborhood Story Project) and the Mandingo Warriors. We will explore the impact of Harris' vision and his embodiment as the Spirit of Fi Yi Yi on the lives of the members of the tribe and the surrounding community in which it is embedded, and as well on the lives and work of the anthropologists who have journeyed with the Mandingo Warriors through the years.

8325 (Re)Engaging Art-Based Research: The Power of Dual Creative/Anthropologic Orientations for a More Innovative and Applied Anthropology

Start Date: 11/21/2025 4:15 PM **through** 11/21/2025 5:45 PM

Venue: Marriott **Room:** Bacchus

Type: Roundtable/Town Hall

This roundtable explores the potential utility and value of researchers' dual creative/anthropological orientations in research contexts. As anthropologists increasingly turn to artistic methods to revitalize ethnographic inquiry and engage nonacademic audiences in scholarship, a dual creative/anthropological orientation empowers anthropologists by providing an additional critical mode of inquiry and way of engaging research participant engagement. This orientation enables researchers to reimagine fieldwork relationships, dynamics, methods, research outputs, and epistemologies in ways that foster renewed connection and collaboration with research communities.

Significant figures in anthropology, like Zora Neale Hurston, and contemporary researchers, like Trinh T. Minh-ha and Sarah Pink, have long blended creative and traditional ethnographic methods, combining photography, film, and creative storytelling in combination with more traditional

anthropological modes of research like participant observation and interviewing. Further discussion on one's locus of identity as an anthropologist or artist, or, importantly, anthropologist and artist, can contribute to our understanding of creative and artistic practices as a means of conducting, orienting, and interpreting research.

Incorporating practices such as storytelling, visual arts, performance, poetry, and multimedia installation allows for more flexible, responsive, and innovative forms of ethnographic representation, interpretation, and production. In particular, creative modes help reveal emotional, sensorial, and ambiguous affects often absent from conventional anthropological scholarship. These forms resonate deeply with both researchers and research participants, cultivating empathy, shared understanding, and affective and reflexive insight. They also open space for co-creation, production, and analysis, enabling research communities to contribute more meaningfully to knowledge production and translation. Additionally, skills developed through artistic pursuits, such as problem-solving, active self-reflection, spatial/visual reasoning, and comprehension of audience engagement, are highly applicable to rigorous anthropological research.

As academic institutions seek to decolonize anthropology and expand the practical reach of research, creative orientations offer powerful perspectives to engage broader and more diverse audiences. Panelists of this roundtable include designers, performance artists/dancers, writers, musicians, and fine artists whose research production and dissemination are enriched by their dual orientations as anthropologists and artists. Through brief presentations and a Q&A, this roundtable will address how dual creative and anthropological orientations and art-based methods contribute to transformative and more inclusive work in anthropology.

North Florida, Department of Sociology, Anthropology, and Social Work, Ashley J. May, Brown University, Department of Anthropology

Presentation(s): "This does not render the world gentle" An Anthropological Foray into the Worlds of Fungi and Art

This flash presentation sits with fungal magnetism as affect that "does not render the world gentle," but instead invites a non-innocent wonder in the face of indifference. To do so, I present a series of short, poetic vignettes taken from my master's research project working with artists inspired by fungal worlds.

For the project itself, I worked with artists whom I gave prompts, some of which included each other's art, as poachable points of inspiration to create new works in various mediums. Art and interviews for this project are gathered in a written thesis and a short experimental documentary, "do i know you, mushroom?" The film and thesis are not explicitly linked, but rather, entangled as two expressions made with art and themes gathered throughout the research process - two baskets of mushrooms collected along the same forays.

In this talk, I offer some of these 'mushrooms' as 'poachable' prompts for listeners to feel through the pull of mushrooms, to consider what it means to make art in the midst of climate crisis, and to critically examine stories that position fungi as hero.

Presenter(s): Morgaine Lee

Arts/Anthropology Session: What if the H(a)unted Could Make Images?

Informed by ongoing conversations and collaborative work between arts and anthropology practitioners, this quasi-performative talk will draw upon still and moving imagery included within the indefinitely ongoing visual art project, DESCENT $\approx$ An Atlas of Relation. Presented as a meditation of sorts, the question, What if the H(a)unted Could Make Images?, will be repeatedly posed in correspondence with projected visuals of earth, plant, and animal forms living and dying together across both great and small distances. Occupying the liminal space(s) of water-based worlds permanently re-shaped by extractive actions and colonial forms of "species management," the varied Beings gestating within and along these waters endure ongoing disruptions, forever altering how these spaces have and continue to function as home, and community. As print and video recordings, their bodies are transformed into phantom residue, bringing visibility to aspects of our world(s) that often go unnoticed, or are difficult to see. The screen-based images perpetually cycle and return against their isolated fragments embalmed in still(ed) form. These temporal distinctions re-present entangled life as unpredictable, dynamic, and relentless, suggesting the rich potential of transgenerational, multispecies relations.

--- Much of the language, above, is indebted to Donna Haraway's thinking and phrasing, explicitly referred to in certain passages. Other sections loosely allude to Luce Irigaray's, *Marine Lover*, a text I became aware of through the writing of Astrida Neimanis who references this work in relation to concepts of hydrofeminism. The session title, "What if the H(a)unted Could Make Images?," cites a

version of a question posed by Michael Taussig during a discussion moderated by Andrés Romero related to Taussig's book, *Corpse Magic*.

Ghosts in the gallery: autoethnographic reflections on curation

Drawing on autoethnographic reflections from curating a visual art exhibition, this paper destabilizes the boundary between fiction and non-fiction to interrogate the politics of language and knowledge production within the ghostly architecture of the academy. It stages a fragmented encounter between four figures-the Researcher, the Curator, the Artist, and the Activist-who navigate a collaborative Exhibition in the haunted afterlives of empire. Through these entangled personas, the paper explores the limits of conventional academic forms in representing the embodied, the relational, and the exilic, asking what it means to curate knowledge under the weight of colonial inheritances and epistemological rigidity. By foregrounding the ghostly as both metaphor and method, the work experiments with narrative as research-creation, interrogating who speaks, who is silenced, and how voice is curated in contexts of violence and hegemony. In doing so, it calls for a scholarship that holds space for the spectral-what lingers, haunts, and resists capture by traditional forms-proposing curation as an alternative modality of thinking, feeling, relating, and knowing.

Presenter(s): Sara Wong

Papernest: A Multimedia Project Housing Insect Imaginaries

Papernest is a multimedia project that uses images, film and an interactive website to explore the commodification of insects in Oaxaca, Mexico. It houses research interrogating globalized and colonial forces that impact participants economically, socially, and ecologically, and how their lived experiences might be representative of broader post-colonial tensions and realities (Pfister and Gaytán 2024). We use sensory, ethnographic filmmaking and participatory methods to engender resonances and contradictions between long-standing traditions and newly-emerging narratives surrounding insects that range from shock and disgust, to energies toward "rediscovery" of trendy Mexican "super foods" (Katz and Lazos 2016) and natural dyes with longstanding cultural significance in Oaxaca. Multimedias communicate anthropological ideas with audiences beyond the academy, including dialogue with research participants about their ideas that informs this collaborative work.

Presenter(s): Anne Pfister

Signifying Blackhood in Toni Cade Bambara's "The Golden Bandit": Or, Notes for the Revolution That Is Here

On 25 February 1985, the late author and cultural critic Toni Cade Bambara opened a Library of Congress reading of her novel *If Blessing Comes* with a tale she fashioned "to remind people to question the official version of things, to put the authorized tale, a con text, into a critical context." (Bambara 1995). This tale, "The Golden Bandit," is a sharp retelling of "Goldilocks and the Three Bears" that offers a Black feminist anti-oppression critique, resituating the classic narrative into a Black space (Sullivan 2022). Bambara continued to fashion and refashion this tale, "The Golden Bandit," throughout the 1980s while working on a novel about the Atlanta missing and murdered children's cases and a documentary about the Philadelphia police's bombing of the MOVE home in the Cobbs Creek neighborhood. In this reimagining, Bambara signifies Blackhood (Bambara 1970), by way of a call and response of strategic utterances with a particular shared meaning (Kernan 1999). Using this film collage as source material, I discuss how language and sound are used to signify Blackhood by way of Bambara's anti-oppression critique. How this tale of the deep south is nothing new—rather, an expression of the Black south's hauntings, its ongoing violent reincarnations as a project and not a place, to conjure the words of Glissant (1989). Fashioned in the wake of serial murders of Black children in Atlanta from 1979 - 1981, it orients us toward an immense devastation in the world that settles, like dust, in barely perceptible traces allowing us to carry on (Glissant 1989). This paper positions the tale as a site where Bambara sets the stage for the ideological work her posthumous novel is doing—revising and challenging a variety of prevailing official narratives about victims, suspects, con/texts, and the consequences of racialized terror, interrupting narratives of place naturalized by western framings of North/South. It is a conversation with the dead, a response to Bambara's call to get our house in order: "If your house ain't in order, you ain't in order. It is so much easier to be out there than right here. The revolution ain't out there. Yet. But it is here." (Bambara 1970).

Presenter(s): Emily Steinmetz, Washington College, Department of Anthropology, Andrew McGrath, University of California, Irvine, Department of Anthropology, Alexander Lowie

Presentation(s): Ghosts and the Carceral State in Western Ohio

Inspired by the conference theme, I explore ghosts that haunt the carceral landscapes of Western Ohio and those who are imprisoned there. The Dayton Correctional Institution (DCI), a women's prison in West Dayton, opened in the 1980s. Archival photos of the prison's construction show a panopticon tower from the old prison work house peeking at the scene from the background, from a site adjacent to the new facility. Images from inside the new DCI – after it was built but before people were brought there – are eerie in their emptiness, particularly from the vantage of 40 years later after countless people have suffered, survived, and struggled in those spaces. Additional photos from the archives offer glimpses into people's lives in the old work house from the 1920s-1970s: men playing cards, women doing laundry, a boxing ring with clothing draped over the ropes, an incarcerated couple getting married. The work house is one layer of the state's carceral past upon which the new carceral infrastructures are built. Throughlines of targeted state investments in toxic infrastructures – prisons and landfills – alongside broader disinvestment in human capital and community, connect the past to present.

Over the past eight years I have collaborated with a group of women sentenced to life in DCI. In their writing and our conversations, they describe the ways that they are haunted by their pasts, in all of their complexity. Their pasts are shaped by layered violences, from interpersonal to state-level organized abandonment. They also describe their ghost lives, the lives that could have been had they never been imprisoned, that exist like a shadow to the lives they are living. The ghost lives are happier and family-filled: their ghost selves are caring for sick relatives, making pancakes for grandchildren, snuggling kittens, wrapping birthday presents. One participant called the prison "The Netherworld," suggesting that the people inside were spectral, haunting the land of the living from the carceral margins. In many ways, participants use the Netherworld, their ghost lives, and other spectral metaphors to express their sense of loss and dislocation, their profound grief, and other emotions for which we lack a common language since the experience of life sentencing is indeed uncommon. They also live inside the broader social, physical, and political-economic landscapes that redirect resources from possibilities of human flourishing to carceral buildup. They become part of a complex carceral story and lineage, yet they persevere, try to find hope, and reconstitute meaning amidst the wreckage.

Presenter(s): Emily Steinmetz

Positively Haunting: Ritual, Signs, and Belief within a Spectral Science

The supernatural and the aristocratic share epistemological discursive space in the worlds of American ghost hunters. The contemporary search for empirical evidence of the afterlife is reflected in resurgent signs of Judeo-Christian identity in the social praxes of otherwise secular middle and working-class Americans. Filtered through the so-called "Death of God" and seeded by the paranormal works of William James and Carl Jung, latter-day ghost hunters are increasingly guided by a consecration of western science. Contemporary ghost hunting pulls its spiritual weight from the aesthetics of both faith and physics, and tech-minded wraith-hunters assemble scientific toolkits that do more than add a veneer of positivistic legitimacy, the tools themselves have become artifacts of ritual, hybridized with the legacies of occult practices such as mediumship and the intrinsic lay-channeling of affective registers that permeate purportedly haunted locations. With meaning cultivated in the dual invisibilities of electromagnetic fields and demons, informed by the rotating sign values of noises, goosebumps, and camera compression rates, contemporary ghost hunting has given the paranormally-attuned the ability to simultaneously anchor themselves to the legacy of Cartesian rationalism while surrendering themselves to the mysteries of an elusive supernatural Gnosis.

In this strange brew, once sacred liberal formations such as democracy and equality are conspicuously absent. The acceleration of identity-centered communication platforms including YouTube, has made the performative a crucial aspect of the hybrid rituals of the paranormal scene. Here, in the tumult of branding, hoaxing, and relentless self-promotion, humble subservience to the mystical and divine and any belief in the righteousness of the meek has been replaced by the aristocratic impulse of 21st Century American life, furnishing a latter-day feudal ethics validated at the fulcrum of science and religiosity. This flash presentation materializes from my ongoing ethnographic project in the world of American ghost hunters where the objects of their practice signify the scientific predilections of contemporary American spirituality among the working and middle classes.

Presenter(s): Andrew McGrath

The Ghosts of Supremacy: Conspiracy, Subjectivism, and the Metaphysics of Militias in North Central Florida

This flash presentation is based on my ethnographic fieldwork and explores how contemporary militia movements in North Central Florida, particularly groups affiliated with the alt-right "Patriot Movement," operate within a haunted ideological landscape. Though participants claim to have distanced themselves from explicit white supremacy, my research reveals that foundational narratives of racial paranoia, elitist betrayal, and apocalyptic struggle remain deeply embedded in their worldview. Drawing on fieldwork with local actors including members of the Proud Boys and an allied rural collective which identifies with the Three-Percenter Movement, I show how conspiracy theories serve not only as ideological glue but as theological doctrine: a metaphysical framework that codes resistance to liberal institutions as moral good. A frame which ultimately led, in part, to the storming of the Capitol on January 6th.

Participants view mainstream knowledge producers and taste-makers, like universities, media, and government agencies, as corrupted vessels of deception, leading them to embrace what Michael Barkun terms "stigmatized knowledge." This knowledge, often shared through memes, YouTube videos, or informal gatherings, circulates through affective and moral registers, producing what I argue is a subjectivist epistemology. Belief becomes a performance of patriotism, and personal truth is valorized over shared empiricism. "Doing your own research" leads you down an experiential subjectivist rabbit-hole.

Rather than simply reviving past supremacist movements, these actors construct a new metaphysical terrain, one in which belief in conspiracy, spiritual warfare, and self-reliance becomes a form of social and political identity. This terrain is compared to those described in Kathleen Belew's "Bring the War Home," which is rooted in post-Vietnam War survivalism and white separatism. This talk contends that the "ghosts" of white supremacy are not absent, but transformed and embedded in a politics of myth, martyrdom, and moral clarity that continues to animate the American alt-right.

Presentation(s): "I Think We're Getting a Little Handmaid's Tale-y Here": Understanding Abortion Bans Through Dystopian Literary Allusions

This talk explores the referencing of popular literature to convey an imagined future amongst pro-choice activists in Westerborg, TX. When describing their perceptions of the present and future, pro-choice activists would sometimes allude to popular dystopian literature - primarily the Hunger Games series and The Handmaid's Tale. Through these literary references, interlocutors were able to convey a larger scale dysfunction than they could otherwise communicate by utilizing popular images of imagined dystopian futures.

Presenter(s): Hannah Noblewolf

Abortion, affect, and the nation: emotional regimes of reproductive governance in contemporary Italy

In the context of growing concern over Italy's declining birthrate, recent public policies have taken a markedly pronatalist turn. Motherhood is increasingly framed as a civic responsibility and a

demographic necessity, while anti-abortion agendas advance under the guise of supporting life and families. These shifts unfold within broader dynamics of reproductive governance (Morgan & Roberts 2012), where state and non-state actors deploy "phantasmagrasms of population" (Murphy 2017) to reassert control over reproductive life in the name of national survival. Rather than acting through legal restriction, contemporary abortion governance in Italy operates through more subtle mechanisms, such as moral persuasion and the modulation of affect.

Based on my doctoral research, this paper focuses on the case of Piedmont, a northern Italian region that has become a laboratory of institutional pronatalism. In recent years, regional authorities have actively supported pro-life initiatives, such as the public funding of anti-abortion counseling centers and the opening of pro-life help desks within public health facilities. Among the most emblematic measures are programs of economic assistance for women who decide to carry their pregnancies to term after initially considering abortion. Although publicly framed as support for maternity, these programs are managed by pro-life organizations whose explicit aim is to discourage abortion through material incentives.

Drawing on feminist ethnography, the research is based on participant observation in reproductive health services and pro-life spaces, and on interviews with women and pregnant people who have had abortions, as well as with the beneficiaries of pro-life programs. This approach centers the embodied, affective experience of navigating reproductive care, revealing how abortion is not only governed through institutions, but also through feelings that are elicited, shaped, and contested. Within these regimes, affect becomes both a mechanism of governance and a site of resistance, as individuals rework, refuse, or resignify the "feeling rules" (Hochschild 1979) imposed upon them.

Ultimately, the presentation argues that Italy's demographic response is not merely a technocratic concern, but a political project of national reproduction. By foregrounding the affective and moral dimensions of abortion experiences - including dissonances, refusals, and counter-narratives - this research interrogates the contradictions of contemporary governance: policies that claim to support life may, in practice, delimit whose life is valued, whose reproduction is encouraged, and at what cost.

Presenter(s): Elisa Muntoni

Colonial Shadows: Rethinking Gender and Sexuality in Postcolonial Southeast Asia

This paper explores the enduring impact of colonialism on gender norms in Southeast Asia and highlights the value of postcolonial feminist approaches in understanding and challenging these legacies. Focusing on Malaysia, Singapore, and Indonesia, the study draws on María Lugones' concept of the "coloniality of gender" and Aníbal Quijano's "coloniality of power" to examine how colonial regimes imposed Western binary gender systems that disrupted diverse, fluid, and localized gender identities. The paper also applies intersectionality theory to unpack the entanglement of race, gender, class, and sexuality within colonial structures.

The study analyzes colonial and postcolonial institutional mechanisms-particularly in legal and educational systems-that have reproduced gender hierarchies. Case studies include Singapore's

Section 377A, a colonial-era law that criminalized male same-sex relations, and Anglo-Chinese School, where elite masculinity and Christian heteronormativity were reinforced through British educational ideals. The paper also revisits pre-colonial gender diversity, such as the Bugis "bissu" and the flexible gender roles within Orang Asli communities, which were later marginalized by colonial and religious systems.

Through a critical review of historical and contemporary sources, this paper argues that colonial gender structures are not relics of the past but remain embedded in modern Southeast Asian nation-states. Postcolonial feminist theory not only reveals these continuities but also offers tools for reimagining gender beyond binary and Eurocentric frameworks. By emphasizing local knowledge and culturally grounded gender expressions, this study contributes to a more inclusive and decolonial approach to gender justice.

Coming of Age in War: Armed Conflict and Age at Menarche

Armed conflict and forced migration (ACFM) consistently create a suite of stressors that prove challenging for biological development. Research on the impacts of ACFM often focuses on earlier pre-adult life stages (prenatal, infancy, childhood) due to the rapidity of growth and critical periods of development during this time, as well as because of their biobehavioral vulnerability. However, adolescence may also constitute a sensitive period (e.g., puberty and psychoneurological maturation) through which the impacts of ACFM adversity can become embodied, such as through linear growth, pubertal timing, and mental health. Research in public health and psychology indicates that some forms of early life adversity may accelerate puberty, perhaps heightening risks for mental health disorders. However, it is not well substantiated whether adversities typically experienced in ACFM contexts accelerate or delay relative pubertal timing. We conducted a narrative review which reviewed empirical findings (n = 29 studies, n = 36 samples) concerning the effects of ACFM-derived adversities on age at menarche. We found war-derived early life adversity was more consistently associated with pubertal delay than acceleration. We discuss the importance of emphasizing different types of early life adversities (psychological, nutritional, etc.), which cannot be operationalized in the same way across contexts and populations, especially in the presence of extreme forms of human stress and resilience.

The Haunted Womb

In the wake of the Dobbs decision, how are ghosts being represented in art, and activist spaces? Are emotions such as conflict and ambivalence becoming poltergeists in the face of new conceptions of fetal personhood? The Haunted Womb proposes that the Dobbs ruling is an invitation to reconceive and expand abortion to include transgressive, intersectional, and queer sexual and reproductive liberation.

I will present the results of a qualitative case study interrogating how activists, artists, full spectrum doulas, abortion carers and speculative fiction writers are articulating new ways to talk about death – of both fetuses and pregnant people – through their publicly available works. My research includes interviews, analysis of written texts, ethnography, and autoethnography. I interpret these sources using Derrida's (1994) concept of hauntology, which in this context refers to the way that overturning Roe vs. Wade upset linear temporality by raising 'spectres' for people who are part of diverse activist networks advocating for bodily autonomy. These spectres take the forms of remembering past trauma, both personal or historical, anxieties and fears about the future, and dissociation and anger with the present. Rather than attempting exorcism, the interlocutors integrated spectral ethics which they applied by strengthening their mutual aid networks, diversifying their tactics, and creating publicly available art that transgresses abortion binaries and tired tropes.

This paper asks us to (re)consider how we talk about death in reproductive justice space, both fetal and maternal, and the power (and failings) of speculation as an activist intervention.

Weaponizing Rape // Entextualizing Rape: The Ghosts of the Weapon of War

In response to the October 7th attacks, media reports circulated sensational claims of " Hamas mass rapes," alongside allegations of beheaded babies and children burned alive. These accounts, however, were based largely on speculation rather than forensic evidence or firsthand testimony (Tatour 2023; Elia 2024; Abunimah 2025). Despite this lack of substantiation, rape claims were weaponized to manufacture consent for intensified military violence against Palestinians as part of a broader genocidal campaign (Feminist Solidarity Network for Palestine 2024)-an example of what scholars have termed the "cunning of gender violence" (Abu-Lughod, Hammami, & Shalhoub-Kevorkian 2023).

This paper analyzes a range of sources-including mainstream media, reports by the United Nations Special Representative on Sexual Violence in Conflict, and public presentations and "testimonies" by the Chair of the Civil Commission on October 7th Crimes Against Women and Children. Building on critiques that situate the weaponization of rape within broader Islamophobic and orientalist tropes (Elia 2024; Ihmoud 2024; Feminist Solidarity Network for Palestine 2024), the paper examines how sexual violence emerged as an indisputable potentiality, haunting the discursive aftermath of October 7th. Using the lens of entextualization (Bauman & Briggs 1990; Silverstein & Urban 1996; Blommaert 2005), it traces how the "rape as a weapon of war" discourse was appropriated, recontextualized, and circulated to tragic ends.

Specters of past violence-particularly the ghosts of Ezidi women, Kurdish female fighters, and other ethnicized and gendered figures-were invoked to legitimize state violence. This presentation interrogates how such spectral discourses continue to animate and justify militarized and ethnicized forms of governance in the present, performing the evidentiary labor that the absence of testimonies and firsthand accounts fail to provide.

Presenter(s): Mairéad Smith

“Borderlands, body-lands: Biomedical neglect and control on the margins of empire”

Across North America, reproductive and maternal health services are increasingly inaccessible outside the countries' metropolitan centers. Simultaneously, public concern surrounding potential maternal-fetal transmission of environmental toxicants puts pregnant and parenting individuals' actions under the microscope. This is especially relevant in the U.S., where the overturn of *Roe v. Wade* opened the door to new levels of reproductive surveillance and the criminalization of pregnancy outcomes. These dual forces of biomedical neglect in the form of centralizing healthcare on one hand, and both state and scientific control over reproductive bodies on the other, create a suffocating – even tacitly eradicated – dynamic that scholars have previously identified in other contexts. Based on ethnographic and collaborative research in rural communities along the easternmost end of the U.S.-Canada border, I examine how the peripheral reproductive body is treated as a metaphorical and material proxy for the larger othered and overlooked borderland/body-land: a critical merging of decolonial feminist concepts and epistemologies that acknowledge the inextricability of the body from its political and natural environment. Tucked into this crease between settler states, on the rocky continental margin, families face real healthcare scarcity as well as discursive desertification. Nonetheless, neglected corners can be fruitful places.

Presenter(s): Gianna DeJoy

8425 Multiscalar Violence and the Anthropocene

Start Date: 11/21/2025 4:15 PM **through** 11/21/2025 5:45 PM

Venue: Marriott **Room:** Balcony L

Type: Oral Presentation Session

In March 2024, the International Union of Geological Society rejected the proposal to officially recognize the Anthropocene epoch. The selection-swiftly rescinded-of Crawford Lake as the single origin site of the Anthropocene hinged on the sedimented layers of multiple chemicals, including nitrogen from fertilizers, ash from coal, and plutonium isotopes from nuclear weapons. This not only shows that the Anthropocene is overdetermined, but it brings into sharp focus the paradoxical nature of this alleged planetary era of extinction which claims a single origin born from the centuries-old accretion of violence across different sites, periods, and interactions. The panel grapples with this paradox to examine the world-making propensities of violence underpinning the Anthropocene across multiple-at once overlapping, clashing, and emerging-scales. Drawing from case studies in Turkey, Iraq, Peru, India, and the United States, the panel discusses the slow metabolization of harm across bodies of water, the inextricable relations between the creation and restoration of warzone ecologies, the volatile, mercurial, and potentially lucrative character of toxic assets, the governance of futurity through plastic materialities, and the dream images of progress in dead stands of trees. By attending to the materially and temporally unstable environmental formations and modes of being human emerging from within the battle/fields of racial capitalism and settler colonialism, the panel unpacks the Anthropocene as the indefinite effect of multiscalar violence.

Presentation(s): What the Sea of Marmara Teaches Us About the Anthropocene

In the summer of 2021, a thick, gelatinous bloom of marine mucilage surfaced across Turkey's Sea of Marmara. Described by many as the "death of the sea," this sudden event drew national outrage and international headlines. But what if the mucilage was not a crisis in its own right, but rather the delayed surfacing of submerged, multiscale violence? What if what appeared on the surface as ecological catastrophe was, instead, a condensation of tectonic, industrial, hydrological, and geopolitical entanglements unfolding over decades? This paper traces the emergence of mucilage through the slow accumulation of marine stratification, petrochemical effluents, and the relocation of Istanbul's industry to the shores of the Marmara. It situates the sea not as a passive container but as a tectonically unsettled, infrastructurally burdened, and politically expendable body of water, shaped by the North Anatolian Fault Zone, deep-sea waste discharge, mega-project construction, and shifting political currents. Rather than marking a clean origin or a terminal collapse, the Sea of Marmara registers violence across multiple temporal and spatial scales. By attending to this in-between sea as a site of lithic drift, where stone, sludge, and policy move together, I propose a reframing of the Anthropocene through the focus of the slow metabolization of harm. What the Sea of Marmara teaches us is not how the world ends, but how ecological and political violence drifts, thickens, and reappears.

Presenter(s): Zeynep Oguz

The Value of Eden in Iraq's Marshes

Through an analysis of wartime biodiversity conservation of Iraq's marshes I analyze war as an ecology. To say that war is ecology requires analysis of war as a dynamic energy of relations that values lifeways on earth for extraction. A warzone ecology operates by producing value. In this paper, I explore wartime value creation by examining the intrinsic role of image making to that process. I share environmental historian Rob Nixon's (2011) concern that our capacity to recognize violence is directly related to the images, media and otherwise, that define the spectacular violence of bombings and gunfire rather than the mundane and less visible but deeply entrenched unfoldings of violence such as the transformation of nature. As we know from Judith Butler (2009), image-making is war. The NGO spearheading marshlands conservation made a case for the significance of doing so by arguing Iraq's marshes were the original site of the Biblical Garden of Eden. By tracking Eden, I analyze how media reportage was not only instrumental in shaping popular understandings of the Iraq War, but also that media consumption was intrinsic to the creation of economic and moral value that was transactional for multinational experts and facilitated profiteering. Warzone ecology offers a way to analyze how planetary recuperation in our

geologic era and the Global War on Terror are pursued in inseparable relation, thereby opening up new avenues for conceptualizing war, nature, and violence.

Presenter(s): Bridget Guarasci

Transecting Ghost Forests: From Dead Plantations to a Dream that Never Dies

Low-lying forest landscapes are rapidly converting to saltwater marshes and swamps along the eastern seaboard of the United States due to climate change. This process is producing a particular forest type that biologists refer to as a "ghost forest." In this paper, I retool the ecological method of walking a transect to track the multiscalar violences involved in the formation of ghost forests in coastal North Carolina. We begin at the site of Walter Raleigh's so-called "lost colony," which is memorialized in a play that has been put on annually since 1937. This origin story is an explicitly white nationalist play, and it tells the story of the "dream that never dies" of Raleigh's colonial ambitions. From there we move inland to the abandoned timber plantations and corporate farms and recount the stories of progress and improvement that animated their infrastructures. I will tell the story of First Colony Farms, named in honor of the "lost colony", which was carved out of the wetlands in the 1970s by a shipping magnate with profits made from running the logistics operations of the Vietnam War. We will move across bombing ranges and a municipal waste dump. I argue that narratives of ecological collapse can too easily mirror stories of progress if we do not attend to the multiscalar violences of settler-colonialism, militarism, and finance that subtend both narratives. How are ghost forests made, not just in the wake of rising seas, but also in the wake of plantation?

Operation Mercury: Open Veins, Green Washing, and Anthropocenic Assets in Latin America

This paper examines multiscalar violence surrounding the application—and proposed eradication—of liquid mercury in artisanal and small-scale gold mining in Peru's Amazonian region of Madre de Dios. The United Nations-sponsored Minamata Convention is a global accord that seeks to eliminate human emissions of mercury. The Peruvian government has undertaken violent military evictions of miners in an emergency effort dubbed: "Operation Mercury" in the name of ecological conservation, climate crisis, and the Minamata Convention. It is an altogether undemocratic effort, an exercise of State power that fails to acknowledge the lack of alternatives for miners and the global demand for gold. The government intervention also creates ecological harm when gasoline, mining equipment and stashes of mercury are bombed in the rainforest. This paper brings ethnographic findings into conversation with debates on the Anthropocene, Latin America's "pink tide" and "green washing" as an enduring settler colonial practice. The emergence of mercury as a politically-charged substance attests to the longstanding political assemblages that involve the violent oppression and dispossession of people in extractive economies, resulting in toxic assets. This paper underscores the role that toxic assets—volatile, mercurial, and lucrative—and ecosystem-services play in neoliberal extractivism, as part of globally-scaled efforts to control who siphons natural resources from the open veins of Latin America.

Presenter(s): Ruth Goldstein

Scalar Violence, Unequal Futures: Caste and Toxic Exposure in Mumbai

Drawing from ethnographic research on caste, plastic toxicity, and municipal governance in Mumbai's informal recycling economy, this paper rethinks Anthropocene temporalities and scales through the lens of futurity. It argues that bodily exposure serves as a critical scalar nexus, intimately linking immediate corporeal harm with enduring planetary contamination, shaping who has access to livable futures and who remains excluded. Plastic materializes as both an immediate site of bodily violence and a persistent ecological pollutant, embedding toxic legacies into marginalized bodies and environments across generations. Through municipal waste governance, capitalist practices, and bureaucratic interventions, caste hierarchies are continuously reproduced, strategically allocating toxic exposure and normalizing suffering as inherent to marginalized communities. Such governance explicitly shapes futurity, determining whose bodies endure harm and whose futures are protected or foreclosed. This paper insists that environmental injustice—and hence the Anthropocene—is fundamentally about the governance futurity, about who can imagine, inhabit, or is denied a viable future. Ultimately, the paper foregrounds futurity as a political terrain shaped by administrative choices, asking whose suffering remains invisible, whose lives are deemed disposable, and whose futures are allowed to flourish or are systematically denied within Anthropocene discourses.

Presentation(s): A community as human sensors: “the smell”, risk and air quality research in South Bay, California

Individual perception of intrusive odors may be unique, but in South Bay, California, references to “the smell” signal a shared, embodied experience. For nearly a century, residents have endured the impacts of U.S-Mexico cross-border sewage pollution flowing from the Tijuana River, through their community, and into the Pacific Ocean. This incessant pollution crisis has been continuously downplayed as an issue of poor water quality, easily avoided by staying out of the water, while the strong sewage smell was long dismissed by authorities as a mere nuisance. In 2024, a team of

researchers launched a comprehensive air quality monitoring campaign in San Diego's South Bay, a vibrant seaside community whose sewage-contaminated beaches had remained closed for over 1000 days, revealing a long-dismissed air quality crisis. Working alongside local residents while conducting water and air measurements, the team was able to analyze not only chemical and biological compounds, but also the sensory and social dimensions of the environmental crisis. Community members opened their homes to host monitors, guided scientists to key locations, and shared personal narratives about illness, adaptive strategies, and grassroots organization. Where the sewage smell was present, extremely high levels of hydrogen sulfide were identified, closely matching community reports of symptoms such as nausea, headaches, and respiratory and gastrointestinal distress. Using an ethnographic approach, along with surveys and interviews, this paper explores how the smell itself became both a form of toxic exposure and a means of environmental witnessing. It reflects on how collaboration with residents supported the monitoring effort, showing how community observations and embodied responses helped connect scientific findings to the lived realities of pollution, environmental injustice, and border dynamics.

Grounding anthropology: notes on developing applied energy research

As national energy systems change in diverse, locally specific ways, anthropologists have a critical role to play in shaping the epistemologies and methods that guide energy research and planning. While technical assistance programs and planning models increasingly acknowledge the importance of social dimensions, they often rely on narrow, rationality-centered frameworks that reduce decision-making to cost optimization and behavior change. In doing so, they risk overlooking the sociopolitical histories, cultural logics, and lived experiences that define how energy systems function on the ground.

This flash presentation shares insights from efforts to embed anthropological research into the development and enhancement of energy planning models used in federal technical assistance initiatives. Rather than merely supplementing techno-economic analysis with qualitative "context," this work positions anthropology as a core epistemological partner in co-producing knowledge about how energy systems operate and who they serve. It examines how concepts such as affordability, resilience, and reliability-central to energy planning-take on different meanings across communities, and how these meanings are shaped by legacies of exclusion, regulatory constraints, and everyday energy practices.

For example, energy affordability is often modeled as a fixed percentage of household income, yet anthropological engagement reveals that affordability is experienced relationally-mediated by housing precarity, trust in institutions, and informal support networks. Similarly, resilience is frequently framed as infrastructural redundancy or recovery time, but in many communities, it is tied to cultural continuity, social cohesion, and historical experiences of abandonment or harm.

These findings suggest that planning models and decision tools must be interrogated not only for what they measure, but for how they define and structure the very problems they seek to solve.

Working from within interdisciplinary teams in a national laboratory setting, this research also reflects on the practical and political challenges of institutional integration-negotiating timelines, data structures, and validation standards that do not always accommodate ethnographic knowledge. Yet it also highlights opportunities: building internal capacity for qualitative analysis, designing more reflexive models, and shifting from extractive engagement to long-term, community-led collaboration.

With this discussion, I propose creating a space to reflect on what it means to practice anthropology in applied, technical settings-particularly where the ghosts of positivism linger, and where suspicion of qualitative work or anti-scientific tendencies can make our roles simultaneously necessary and precarious.

Presenter(s): Lis Furlani Blanco

Growing with the Dead : Haunted Landscapes and Multispecies Care in China's Ecological Burials

This ethnographic study examines ecological burial practices in contemporary China through the lens of multispecies ethnography and the anthropology of being haunted, investigating how environmental ethics and more-than-human actors reshape traditional death practices. Drawing on fieldwork at ecological burial sites, this research explores how multiple entities participate in and transform death practices, creating new forms of connection between the living and the dead.

The study conceptualizes ecological burial sites as haunted landscapes where multiple temporalities coexist and intersect. It argues that ecological burial sites can be understood as haunted landscapes, not in the conventional supernatural sense, but as spaces where past, present, and future converge through the entanglement of human remains, living organisms, and environmental processes. Through their growth, decay, and renewal, these more-than-human actors engage in complex interactions that reshape traditional understandings of death, memory, and care.

The research reveals how different species and materials become entangled in practices of care that extend beyond traditional ethic to encompass environmental concerns. The decision to integrate human remains into natural cycles through tree or flower burial represents a significant departure from traditional death practices, reflecting broader shifts in how contemporary Chinese society conceptualizes relationships between humans and nature.

This study contributes to both environmental anthropology and death studies by theorizing ecological burial sites as haunted landscapes where multispecies relations and temporalities transform traditional practices. Through examining how environmental ethics become embodied in intimate cultural practices around death, this research offers new insights into China's sustainable development and ongoing social-ecological transformations.

Presenter(s): YUYUN ZHAO

Paraecology in Practice: Anti-Mining Science and the Political Ontology of Environmentalism-Across-Difference in Intag, Ecuador

Part of the "megabiodiverse" Tropical Andes Biodiversity Hotspot, the cloud forests of Junín, a small agricultural community in Ecuador's Intag Valley, are home to over 100 endemic and endangered plant and animal species, including jaguar, Andean Spectacled Bear, and *Atelopus longirostris*, a species of harlequin frog that was last seen in 1989 before its rediscovery there in 2016 (Meyers et. al. 2000; Torres-Jiménez et. al. 2024; Tapia et. al. 2017). Unfortunately, this stretch of the Andes is also believed to contain hundreds of millions of tons of copper ore; consequently, since 1990, the Ecuadorian state has encouraged a series of foreign mining companies to drill dozens of exploratory boreholes in the protected forests upstream from Junín. According to some assessments, the projected impacts of open-pit copper mining near Junín include the forced relocation of multiple communities, mass desertification, the extinction of several endemic species, and a severe degradation of local water quality (JICA 1996).

Aiming to prevent this, many local campesino-activists have long been working with Ecuadorian and international research institutions to monitor the environmental impacts of exploratory drilling via regular water quality data collection, biological field surveys, camera trapping, macroinvertebrate sampling, and other scientific techniques. These organizations' goal is to promote the collection of ecological data for use in legal suits, especially those brought in defense of the constitutional "Rights of Nature"-a goal they have sought to achieve in Junín by training local people as "paraecologists."

Meanwhile, many of Junín's "paraecologists" continue to engage in ancestral relations of constitutive interdependence with the "natural" entities (rivers, mountains, etc.) that they and their scientist allies now monitor-entities that they sometimes describe as capable of complex emotions and intentional action. Following the lead of scholars of science and technology who hold that reality is "enacted" via the inter- (or "intra") action of various sociomaterial agencies and therefore advocate the study of scientific praxis (Mol 2002; Barad 2007), as well as contemporary anthropologists who suggest that ontological multiplicity within environmentalist social movements can have important political implications for alliances between local territory-defenders and outside environmentalists (de la Cadena 2010), I ask: What sorts of "natural" entities are enacted via local campesino-activists' paraecological praxis? How do these entities differ from those enacted via the other prevalent local practices-like agriculture and the research practices of local activists' scientist allies-to which paraecological praxis is doubtless "partially connected" (Strathern 1991)? Finally, what are the political implications of these differences, especially for the efficacy of the collaboration between local territory-defenders and their scientist allies?

Presenter(s): Patrick Robinson

Representing an Overflowing Ocean: Marine Spatial Planning in the Gulf of Guayaquil

How are blue economy projects developing new representations of the ocean that potentially advance aquatic dispossessions and the privatization of ocean commons? I explore this question

through an analysis of a Marine Spatial Planning (MSP) project in the southeastern Pacific Ocean. MSPglobal Initiative, a project jointly funded by UNESCO and the European Commission, advocates for MSP around the world to establish sustainable blue economies by balancing environmental protection and economic growth through planning. MSPglobal undertook a recent transboundary pilot project in the Gulf of Guayaquil, an environmentally and economically significant aquatic zone off the coasts of Ecuador and Peru. MSPglobal mapped environmental conditions and human activities in the Gulf of Guayaquil to identify "compatibilities" and "conflicts." Blue economy narratives have been associated with frontier imagery that frames ocean spaces and resources as empty and unclaimed (Knott, Wiber, and Mather 2024). In contrast, the MSPglobal project represented the Gulf of Guayaquil as an ocean space overflowing with a density of human activities—shipping, fishing, drilling, conservation, tourism, and more—that needed to be made visible and managed. MSPglobal's technical approach presumed that existing activities would remain in place and could co-exist in a sustainable blue future if planned correctly, thus assuming that there was no apparent conflict between aquaculture operations or hydrocarbon extraction and threatened mangrove ecologies. I argue that this representation of the ocean normalized the presence of extractive industries in the gulf, while obscuring the fluidity and instability of its constantly moving marine environment. The MSPglobal maps hid the spills, seepages, sonic pollution, movements, and migrations through which more-than-human ocean spaces and ecologies entwined and were imperiled and slowly displaced by privatized extractive rights.

Knott, Christine, Melanie G. Wiber, and Charles Mather. 2024. "Aquaculture's Offshore Frontier: Learning from the Canadian Courts on Ocean Grabbing, Ocean Privatization, and Property as Process." *Maritime Studies* 23(5): <https://doi.org/10.1007/s40152-023-00348-8>

The alchemy of toil: Pesticides, human bodies, and the maintenance of social environments

The optimism once widely associated with the use of pesticides, especially the harmlessness of organochlorines such as DDT, and the then benign promise of modern science is long dead. It's been replaced by a shared widespread anxiety around pesticide use and exposure. On one hand pesticides are toxic to most life, on the other hand pesticides are ubiquitous part of life. The concerns of toxicity, bioaccumulation, and biomagnification characteristic of the organochlorine pesticides have been dealt with by a constant expansion of the pesticide arsenal with organophosphate compounds, pyrethroids, carbamates, and neonicotinoids. This expansion of the pesticide arsenal continues to accompany a general sense of optimism on the relative safety of the newer compounds. This, however, has been challenged as new observations on toxic kinetics and accumulation patterns emerge over time.

Our multidisciplinary research project mapping pesticide exposure patterns of a select urban population in India has led us to question the notion that pesticide toxicity is primarily a result of 'bad' agricultural practices in the Global South. Instead, we find that exposure itself is more clearly tied to the maintenance of social environments, not just agriculture. This exposure is geographically, and technically contingent upon the ways in which places are maintained, including

but not limited to the production and storage of food. Key sites of exposure also include public gardens, office spaces, and household hygiene practices. We find that pesticide use puts certain and specific bodies to greater harm than others, human bodies whose suffering is normalised as routine, and made expendable. By analysing pesticide use and exposure, we find an intricate relationship between maintenance and toil (suffering). By making this connection visible we begin assembling neglected things, to ask whose bodies are made expendable, and in what ways, in the regular maintenance of social environments? Through our larger collaboration with scientists studying pesticides, we seek to understand what forms of collaborative, multidisciplinary evidence building can stage the politics of generating care for the suffering which does not yet count? How might we find Pandora's hope as we engage in this alchemy of toil?

What a Model Might Do: Conservation Data, Value and Governance

Computational models underpin much environmental policy and governance, informing decisions about which species need protection from extinction. How should we understand these models, when, as one scientist described it, "everyone knows that they don't work but they do"? Models have become increasingly important interventions politically, economically, and ecologically and yet the practices associated with these tools as well as their impacts remain poorly-understood. Based on archival and ethnographic research at conservation programs and projects in the U.S., this talk traces scientists' efforts to model the natural world in terms of species endangerment. Despite the deep intertwining of economic forms of rationality with conservation modeling, the models can unleash complex and sometimes surprising value practices that are poorly captured by standard economic theory or environmental policy. Recent collaborative, interdisciplinary work with the international biodiversity science community suggests potential ways to advance more effective and just forms of environmental modeling and data governance.

Presentation(s): Beauty, Corpse, and Skeleton: Objectified Body in Chinese Ghost Literature

This paper categorizes the female ghostly figures in Chinese ghost literature into three phases: beauty, corpse, and skeleton. The beauty represents temptation, hyper-femininity, a disguise of a

bigger conspiracy. The corpse, according to its state of corruption, can both represent the fleeting nature of physical allure and the positive manifestation of moral standards. The skeleton represents the ultimate form of human mortality, materiality, and gender-neutrality. Through poems, novels, and play scripts such as *Dream of the Red Chamber*, *Journey to the West*, and *Strange Tales from a Chinese Studio*, this paper illustrates how these phases serve as symbols and imagery to drive narratives and articulate the objectification of women from life to death. In these literary works, women are recorded as aesthetical objects rather than as people. The love towards women in stories is not love for a person but a fetish for a beautiful object. Chinese aesthetics scholar Ye, S. (2018) suggests that the goddess of love and beauty is Yaoji but does not address her hidden identity as a female corpse. Yaoji was an ordinary virgin when she was alive but became a goddess with sexual power after death.

Drawing on the theory of feminist sociologist Gordon, A. F. (1997) in *Ghostly Matters: Haunting and the Sociological Imagination* about how ghosts disrupt time, presence, and social order, this paper situates the three phases of the female body as a haunting figure that both reveals and resists the patriarchal norms of its cultural context.

Haunted Without Grief: Memory, Silence, and the Afterlife of the Third Front Movement

This project examines how personal memories of suffering during China's Third Front Movement—a Cold War-era, state-led industrial campaign rooted in national defense—are absorbed into, rather than disrupt, the dominant nationalist narrative. Drawing from life histories and informal conversations with residents of Panzhihua, a key site of the Third Front Movement, the research explores how loss, displacement, environmental hardship, and emotional silence are often narrated without grief or critique. Instead of expressing trauma, participants frequently align with heroic state discourses, leaving unsettling events, such as suicide and illness, unmarked or normalized. The project engages hauntology as an analytical framework, but questions its applicability in contexts where "being haunted" fails to emerge. The research proposes the concept of "intimate knowledge" to access embodied, domestic, and affective traces of unacknowledged histories. By attending to the tensions between what is remembered, silenced, and officially celebrated, this ethnographic study aims to rethink the affective politics of historical memory in socialist and postsocialist China.

Neither City nor Countryside: The Moral Life of Suburbanity in Post-Urbanization Xiama Village, China

Since the 1990s, China's urbanization has followed a distinctive pattern of spatial expansion, rapidly absorbing rural fringes and generating a landscape of "urban villages." These spaces, though surrounded by urban development, have preserved social structures and moral orders rooted in rural society, becoming critical sites of tension between rural and urban ethics. Corresponding to early redevelopment policies emphasizing market-led demolition, preliminary research also regarded urban villages as "socioeconomic sinkholes." Yet as governance practices institutionalized, scholars began to recognize their positive value, shifting the discourse from how to redevelop toward why and for whom, thereby opening space for reconsidering the resilience of rural moral systems within urban settings.

Following nationwide demolition campaigns, former villagers were rehoused into high-rise replacement communities. Despite their urban appearance and bureaucratic governance, these new communities remain ethically unintegrated. Many former villagers struggle with the transition to urban norms, resulting in a liminal condition—neither fully urban nor rural. This phenomenon has been described as the emergence of "suburban societies," characterized by suburbanity: a fractured moral condition shaped not by incomplete governance alone, but by local responses to institutional rupture. In the collapse of both state governance and communal authority, everyday life is sustained through symbolic improvisation and the mobilization of residual institutional forms. Concepts such as the "good life" and "fairness" are thus negotiated to produce an expedient way of life through kinship, land ethics, and generational memory instead of market and urbanization.

Rather than asking whether urban villages can be successfully urbanized, this paper investigates: how do village communities construct new moral orders and everyday practices in the face of failed urban absorption? And how are these ethical formations sustained through spatial practice and local moral evaluation, ultimately producing a durable yet non-typical outcome of urbanization—suburbanity? To address these questions, this paper draws on five months of ethnographic fieldwork conducted in Xiama Village, China. By analyzing materials including semi-structured interviews with former villagers and new residents, participant observation in community events and rituals, as well as historical documents and media reports related to the redevelopment, the paper captured, understood and demonstrated the process of moral emergence and the social consequences of failed urbanization integration.

Ritualizing the Ghost Boundary: The Naihe Bridge and Chinese Underworld Cosmology around Mount Tai

As the most prominent of China's Five Sacred Mountains, Mount Tai (泰山) has been ritually associated with the governance of the afterlife. Within the city where Mount Tai is located, there is also a river called Nai River (奈河): a toponym shared with the mythological river in Chinese

cosmography that demarcates the boundary between the realms of the living and the dead. In the city's sacred geography, this river similarly functions as a spatial divider: its eastern bank constitutes the domain of the living, while its western bank is ritually designated as the realm of ghosts, with Mount Tai itself representing the celestial sphere. Together, these elements form a tripartite sacred urban structure.

Drawing on local gazetteers and stele inscriptions, as well as ethnographic fieldwork conducted between 2022 and 2024, this study examines the historical process through which the spatial hierarchy of "human-ghost-divine" realms was ritually institutionalized, with particular attention to the role of the Naihe Bridge (奈何桥) in materializing this cosmological imagination.

Specifically, while the Nai River's symbolic association with the afterlife has deep historical roots—attested in early texts such as the Book of the Later Han (后汉书) and In Search of the Supernatural (搜神记), which describe Mount Tai's jurisdiction over life and death and the Nai River as a liminal passage for the deceased: the sacred boundaries of pre-Ming Tai'an remained fluid, with temples dedicated to both celestial and chthonic deities spatially intermingled. The construction of the Naihe Bridge during the Ming Dynasty marked a critical juncture in the formalization of this sacred topography. Far from serving merely as useful infrastructure, the bridge was ritually incorporated into Daoist bridge-crossing liturgies (渡桥科仪), wherein priests performed soul-guiding rites to ritually enact the deceased's traversal of the Nai River's mythic boundary.

This paper argues that the stabilization of sacred space hinges on the mutual reinforcement of material structures and ritual performance. The Bridge's ritual function operated on three levels: Physically, the act of bridge-crossing superimposed a processual dimension onto the Nai River's boundary, transforming it into an embodied sacred practice; Through this practice, traversing the bridge was semantically encoded as a "yin-yang transition" (阴阳过渡), rendering the abstract life-death dichotomy sensorially perceptible through corporeal movement; Furthermore, the bridge's construction facilitated the ritual integration of state-sanctioned sacrifices to the Emperor of East Peak (东岳大帝), the bureaucratic deity governing the underworld, thereby sacralizing Tai'an's spatial boundaries. Through the iterative performance of liturgy, the Nai River's erstwhile abstract symbolism was concretized into a legible spatial order, culminating in the crystallization of Tai'an's tripartite sacred structure.

Sanctifying the Secular: Domestic Worship Spaces in Urban Chinese Christianity

In urban China, many unofficial Christian gatherings take place in rented apartments, office units, or members' homes. These spaces are not designed for worship, yet through subtle transformations—such as placing a cross on the wall, arranging chairs in a circle, or invoking sacred language—they become temporarily "sanctified." This flash presentation explores how believers engage in the ongoing negotiation of sacredness within secular environments, turning domestic or

commercial interiors into meaningful sites of spiritual encounter. Based on ethnographic fieldwork in a Chinese Christian community, I analyze how material arrangements, embodied rituals, and linguistic practices contribute to the construction of sacred space in contexts where official religious infrastructure is limited or unavailable. By tracing these everyday spatial transformations, I consider how faith is not only practiced but spatially imagined, contested, and made present.

Specters of Control: Ghostly Governance and Its Consequences on China's Southwestern Border in the Post-Pandemic Era

This study is based on fieldwork conducted in 2023 in H County on the Sino-Vietnamese border, exploring China's post-pandemic shift towards "border closure" in the southwest and how the state uses the "manufacture of ghosts" to solidify its border governance. Under the guise of preventing the spread of COVID-19 from neighboring Southeast Asian countries, the Chinese government constructed a border wall in Yunnan in 2021. However, this wall is not simply an infrastructural project; it is imbued with political significance, symbolizing the presence of central state power and marking the shift in border governance before and after the pandemic. The term "pandemic" has even become a taboo among border residents, creating an invisible atmosphere of fear. This fear permeates their daily interactions and is continuously reproduced and internalized through institutional mechanisms such as community supervision and border propaganda. The state attempts to use this fear to create "ideological ghosts"-stigmatizing neighboring border residents (even though most of them share common roots with Chinese border residents), provoking nationalist sentiments, reshaping border residents' identities, and erasing the ethnic connections built on cross-border historical memories to push for the "normalization" of the border landscape as envisioned by the state.

At the same time, these ghosts, initially intended to stabilize and differentiate the geographical boundaries, gradually give rise to new ghosts, which exacerbate inequality, ethnic divisions, and rifts within China's border society, further fracturing an already complex border community. While the Chinese government has imposed strict border control measures, local elites, due to their close ties with government officials and their operation of "normalized" businesses, have seen no impact on their profits, even during the three years of complete border closure. In contrast, the markets that ordinary border residents relied on for cross-border trade have been encroached upon and even entirely replaced by local elites, further constricting their livelihoods. The divisions within border society have grown increasingly pronounced due to differences in social capital, and the invisible boundaries have further fragmented the already complex border society.

Despite facing extremely unfavorable policies, this study also acknowledges the efforts of ordinary border residents to navigate and resist the ghosts created by the government. They seek their own "weapons of the weak" from historical memories and experiences, constantly adjusting their strategies and practices. These dynamics not only reveal the "ghost" effects in China's border governance but also demonstrate the resilience and resistance of border residents under strong

state control, offering a more complex and multidimensional understanding of contemporary border governance.

The Politics of the Face: Mixed-Race Aesthetics and the Haunting of Postcolonial Legacies in China

In contemporary China, the rise of "mixed-race beauty" in social media, beauty trends, and cosmetic surgery unveils a paradox: while nationalist rhetoric champions cultural self-sufficiency, beauty ideals remain deeply entangled with postcolonial aesthetic hierarchies. This hybridity is not merely an embrace of global beauty standards but a carefully curated vision that privileges Euro-Chinese features while systematically excluding African-Chinese, South Asian-Chinese, and other non-European mixed identities. Such selective hybridity reveals the racial hierarchies embedded in contemporary Chinese beauty culture.

This paper traces the spectral presence of colonial aesthetics in China's evolving beauty standards. While traits like light-colored irises, deep-set eyes, and sharp brows reflect an enduring admiration for Western ideals, others-such as light skin, double eyelids, and high nose bridges-are rooted in historical Chinese aesthetics. Through digital ethnography and interviews with beauty influencers and social media users, I examine how individuals interpret and embody "mixed-race beauty" in everyday beauty practices.

A striking pattern emerges: when asked about "mixed-race" appearances, respondents overwhelmingly associate the term with Euro-Asian heritage, rarely considering African-Asian, South Asian-Asian, or other non-European mixes. This selective vision of hybridity exposes an aesthetic logic that is as much about exclusion as it is about admiration. In China's media and beauty industries, white or "Euro-American" features enjoy heightened visibility and aesthetic privilege. However, unlike countries with deeper colonial histories-such as South Korea, Japan, and Singapore-China's engagement with Eurocentric aesthetics is less a direct legacy of colonial trauma and more a product of globalized cultural imaginaries. Rather than a remnant of colonial occupation, the preference for Eurocentric beauty reflects a modernist narrative that equates Western aesthetics with progress and sophistication.

By treating the face as a political site-where histories of postcolonialism, nationalism, and globalization intersect-I argue that China's "mixed-race beauty" obsession is not merely a beauty trend but a manifestation of deeper anxieties about identity, modernity, and global positioning. Even as China asserts itself as a rising power, the ghosts of its colonial past continue to shape the most intimate markers of self-presentation.

2661 Geopolitical Hauntings: Rethinking Fieldwork and Knowledge Production Under China-US Geopolitics

Start Date: 11/21/2025 4:15 PM **through** 11/21/2025 5:45 PM

Venue: Marriott **Room:** Bonaparte

Type: Roundtable/Town Hall

Geopolitical tensions between China and the US began escalating with the 2018 trade war and have now reached a point that many scholars have termed a new Cold War. Indeed, nationalist and anti-US sentiments across China have been on the rise, and the trope of "collusion with foreign forces" has been socially and politically legitimized for attacking US-based scholars, local and transnational communities, and grassroots organizations in the name of safeguarding national security. Such highly politicized circumstances have engendered precariousness for not only ethnographic fieldwork in China but also the ethics of knowledge production about China. The COVID-19 pandemic further exacerbated these conditions, with increasing surveillance, control, and restrictions imposed on the general public and scholars alike. How have ethnographers of China navigated such geopolitical conditions in recent years? What are some new possibilities for knowledge production in and about China? How can we reimagine ethnographic commitments amid geopolitically precarious times? What theoretical and empirical frameworks and practices can be engendered to decenter and deimperialize both China and the US? What can we learn from the hauntings of the past to reimagine the future of anthropology amidst precarious China-US relations?

This roundtable brings together ethnographers of China who have investigated complex sociopolitical issues-feminist labor politics, ethics of collaboration, elderly care, trans livability, and grassroots activism-while navigating increasingly constrained fieldwork conditions and tightened regulations in China and the US. Drawing on community-based research with a migrant women's collective in South China, Anzi Dong discusses contestations over transborder feminist knowledge production. Katherine Mason will speak to the role of Covid and geopolitical tensions in breaking down budding partnerships in an engaged project on postpartum mental health in Sichuan. Jianmin Shao will reflect upon experiences with trans young adults in China to rethink the politics of fieldwork and the epistemological divides in anthropological knowledge production. Examining how older adults in China navigate uncertainties surrounding aging and mortality amid the COVID-19 pandemic, Fei Yuan will explore how to form meaningful relationships and generate knowledge "with" rather than merely "about" vulnerable communities. Drawing on experiences as both a fieldwork researcher studying grassroots education in China and a socially engaged anthropologist running the public anthropology platform TyingKnots (结绳志), Yukun Zeng will illustrate how state-centered epistemologies shape the anthropology of China. Ultimately, our collective thought experiment aims to reimagine the response-ability of ethnography and anthropology in politically precarious times and stimulate new questions regarding the future of anthropology under contentious China-US geopolitics.

5106 Specters of Progress

Start Date: 11/21/2025 4:15 PM **through** 11/21/2025 5:45 PM

Venue: Marriott **Room:** Galerie 1

Type: Roundtable/Town Hall

Many anthropologists have sought to make the world a better place or at least to show that improvement does not require undoing differences. Anthropology has also rigorously questioned what "better" means and tirelessly identified violence in modern, colonial, and anthropological projects of improvement. Wary of blueprints, in the late 20th century anthropologists moved towards critical rather than prescriptive projects. Nevertheless, even at its most critical (the period that Sherry Ortner calls "dark anthropology"), when anthropology tried to cleanse itself of all traces of normativity and focused on clearing space for otherwise, it held on to the idea that this otherwise might be or enable something better. Exposing the failure of efforts to improve the human condition has at times itself been a modality in which the discipline has tried to make way for betterment.

"Specters of Progress" takes anthropology's orientation towards something better, variously understood as progress, development, equality, justice, diversity, decolonization or else, as a baseline generalization (what Marx called the abstract) from which to move towards historically specific and concrete articulations. We invite reflections from a range of ethnographic, theoretical, and cross-disciplinary perspectives on what has become a permanent crisis of anthropology.

Indeed, it seems impossible to articulate what "better" might mean and for whom beyond taking a variety of "anti" stances in relation to ever proliferating forms of violence and domination. Might it be that anthropology has thought itself into a corner, whereby its only two options are: (1) serve as an amplifier of the voices of the marginalized without critical engagement or prescription, or (2) accumulate criticisms of ever-adapting forms of racism, capitalism, colonialism? In other words, are debates about the end of anthropology essentially manifestations of the disappearance of the goal of living better with difference? Or are the specters of progress still with us?

2841 SLA Gumperz Graduate Student Essay Prize Panel

Start Date: 11/21/2025 4:15 PM through 11/21/2025 5:45 PM

Venue: Marriott **Room:** Galerie 2

Type: Oral Presentation Session

This panel showcases the four finalists for the 2025 John Gumperz Graduate Student Essay Prize, awarded annually by the Society for Linguistic Anthropology. The award honors John Joseph Gumperz (1922–2013), whose pioneering work in the ethnography of communication and language use in social context has inspired generations of linguistic anthropologists. This year's winning papers concern varied topics and geographic contexts, but what they have in common is careful examination of how people work out aspects of their lived experience through linguistic and semiotic practices. What do people accomplish in "talk about talk," or talk about sound, or talk about landscapes and places? Presenters demonstrate how (post)colonial hierarchies are constituted by mutually reinforcing online and offline practices, how people cross semiotic modalities by means other than lexical semantics, how Indigenous sociolinguistic diversity has been understood before and beyond named languages, and how landscape registers and embodied practices of viewing the land become enactments of knowing. They draw on diverse ethnographic contexts, from violin repair shops in New York City and Boston to pueblos in southern Mesoamerica, and from ridges on the Tibetan plateau to TikTok depictions of Cairo.

Presentation(s): Linguistic diversity and talking about "language(s)" in Cunén before and/or beyond "Mayan:" Listening in to the earliest recording, today

Central to this essay is a consideration of explicit talk about "language(s)" in and around Cunén, a sociolinguistically diverse municipality in sociolinguistically diverse southern Mesoamerica, before and/or beyond contemporary projects of properly named "Mayan languages." By listening to an interview conducted in K'iche' with a sexagenarian local man in the mid-1960s, and comparing his explicit talk about "language(s)" to what I have learned in Cunén today, triangulated with a range of sources from the region, I sketch out an ideological horizon when encompassing Indigenous sociolinguistic diversity is imagined in terms of orientation to named pueblos but where distinct local "(Mayan) language(s)" is/are generally not properly named. Throughout, I explore certain facets of linguistic structure/ideology dialectics as they bear on this case of metalinguistic practice as intersects with histories of symbolic diversification.

Presenter(s): Perry Wong

Talking about Sound: Conversation as a Tool for Timbre

Anthropologists and music scholars who research communication about tone or timbre tend to focus on lexical semantics. Timbre lexicons often include cross-modal metaphors such as "warm," "metallic," and "clean" (Harkness 2017; 2013). Scholars note that these lexicons pose problems of vagueness (Barthes 1978; Dudley 2014). For example, "metallic" may refer to a range of timbres, and one person's notion of a "metallic" sound may not match another's. I demonstrate an alternative approach to analyzing timbre by listening beyond lexical semantics (Carruthers 2023). Instead, I observe how people communicate about timbre in practice through extended conversations and non-linguistic interactions. I examine strategies used by New York City and Boston-based violin repairers (also called luthiers) when they collaborate with violinists to alter instrumental acoustics during "sound adjustment sessions." Such sessions are opportunities for luthiers to physically adjust violins to improve their timbres. Luthiers begin by eliciting musicians' descriptions of desired timbres, then work to make them sensorially real through an iterative and improvisational practice of testing, listening, talking, and adjusting. I build on Porcello's typology of metapragmatic strategies for talking about sound (2004; 1994) to show that luthiers co-create violin sound with musicians through strategies for communicating about timbre that unfold not only through lexical semantics, but also through metapragmatics.

Presenter(s): Juliet Glazer

"Egypt" vs. "Masr" (مصر): The Semiotic Making of Two "Egyptys" on TikTok

In this paper, I analyze, via the popular "Egypt vs. Masr" TikTok format, what I take as the semiotic process and ideological work (Gal and Irvine, 2019) of rendering "two Egyptys"—a "colonial recursion" (Reyes, 2017) where "Egypt" and "Masr" are differentiated by contrasting sets of linguistic and non-linguistic signs whose complex sign relations are in constant, relational making and remaking of one another. I approach how semiotic processes as ideological work forge the co-constitution of "two Egyptys" as "things in the world" that are engaged by both a virtual public in TikTok comments and an offline public. In the Cairo of today, rapid commercial and administrative upscaling, increased securitization and surveillance, and the attendant displacement of the city's urban poor takes place concomitantly with the relocation of the city's elites en masse into the upscale suburbs of the city's eastern and western edges, constituting the economic, political and spatial (re)organization that dialectically (re)produce these "two Egyptys." Through the semiotic analysis of a popular format of TikTok, I take a rigorous theoretical approach to the ideological work that undergirds an enduring colonial hierarchy and ongoing urban spatial transformations in the Egyptian postcolony.

Presenter(s): Marisa Breathwaite

"View the Land and View the Area!": Landscape Registers and Terrain Viewing Acts in Amdo Tibet

In this paper, I explore a few complementary ways of viewing, segmenting, and talking about the Tibetan plateau landscape for plateau residents. I look at how Amdo Tibetan (agro)pastoralists describe and characterize their terrain, trekking the terrain through specific social pathways. By

invoking "viewing" the terrain, I draw on Tibetan metapragmatic description for this activity (ལྟ་བུ་ lta ba), as well as the verb's connotations of contemplation, visual discernment or even analysis. I demonstrate my textual, fieldwork-based, and collaborative trajectory of learning to view the terrain from Indigenous Tibetan friends and consultants. I emphasize acts of viewing, through which — and only through which — Tibetan landscape registers become descriptively true to their speakers. I argue that these registers and acts of viewing are further sedimented in certain bodily habits of viewing the plateau landscape, channeling subjects' mobilities as well as pathways across the plateau. Through the metapragmatics of many (agro-)pastoralists, this total lifestyle and its familiar pathways constitute (agro-)pastoral competence as well as an evaluative matrix for different degrees of Indigenous and non-Indigenous subjectivity under colonial conditions.

3996 The Promises and Perils of Unity in Christianity, Islam, and their Anthropologies

Start Date: 11/21/2025 4:15 PM **through** 11/21/2025 5:45 PM

Venue: Marriott **Room:** Galerie 3

Type: Oral Presentation Session

Christianity and Islam, two of the world's most expansive religions, are haunted by unity in multiple ways. Despite their vast internal diversity, both traditions are marked by assertions of oneness: the oneness of God, the unity of their respective faith communities, and shared genealogies rooted in monotheistic biblical traditions. While it is true that anthropologists have grappled with this tension between oneness and variation, their efforts in this regard can be found mostly in their work to define an object to encompass the theological, social, and ritual variety encountered across continents. First, the anthropology of Islam coalesced initially around a sense of Islam as a "discursive tradition" (Asad 1986). Then later, the anthropology of Christianity, despite eschewing an Asadian line, similarly asserted that Christianity was an entity whose practices could be explored comparatively across space and time. Since these first unifying moves, however, both subfields have largely avoided engaging with actual discourses of Christian or Muslim unity.

This elision can be partly explained. For anthropologists, claims to unity often seem less compelling because they paper over divergence and invite accusations of essentialism. Thus, in the anthropology of Protestantism, for example, we have seen an expressive focus on discontinuity and schism, while anthropologists of Catholicism have repeatedly deployed a Schmittian description of Catholicism as a *Complexio Oppositorum*, a complex of opposites, despite "unity" being a key Catholic category. Meanwhile, scholars of Islam have consistently interrogated notions of unity and continuity, whether associated with Asad's framework or with invocations of the global Muslim community, the ummah, noting that both risk obscuring how Muslims variously interpret, contest, or disregard authoritative texts, practices, and institutions.

Drawing on analyses of Christianity and Islam, this panel aims to address the promises and perils of unity more directly. We explore unity as both a theological and social construct, focusing on how claims to "oneness"-whether of God, community, or tradition-are lived out, contested, and enacted. We ask: how do theological concepts like the oneness of God inform broader discourses of religious and political unity? How are these claims to unity mobilized in response to disunity, both within and outside religious communities? And what might an analysis of these two unities, shaped by shared prophetic traditions, theological exchanges, and histories of coexistence and conflict, offer to our understanding of organizing life in the modern world?

Our panelists address these questions, offering valuable insights into the traditions they study, and even into our current political moment. We think our critical engagements with unity can help us think even beyond religion-and especially about solidarity and political action-without reinvoking troubling universalisms.

Presentation(s): "Servants of the Same God": The Vernaculars of Unity and Difference in Southern Turkey

This paper examines how the Islamic principle of *tawḥīd* (oneness of God) and broader discourses of religious unity are lived, invoked, and fractured in the historically plural city of Antakya, near Turkey's southern border. Drawing on over a decade of ethnographic research, I explore how Muslim and Christian minority communities engage figures such as al-Khidr and the Antakyan saint Habibi Neccar to negotiate esoteric authority, cross-religious genealogies, and shared sacred landscapes. These encounters often index a unifying divine principle or a capacious spiritual community, yet they rarely erase doctrinal or social distinctions. Instead, unity is refracted through everyday acts of differentiation: gendered ritual authority, informal conversions, and patterned silences between unevenly positioned religious groups. Such practices enact a form of oneness that reveals itself in layered, relational ways rather than through universalist sameness. By tracing how political and theological claims to unity persist amid disunity, this paper contributes to emerging conversations about religious cohabitation and minority politics in contexts where Islam and Christianity are not distinct traditions, but terrains of historical intimacy and rupture.

Presenter(s): Mahiye Secil Dagtas

The Idea of a Nonsecular/Nonreligious Anthropology of Islam: The Contextual, the Extracontextual, and the Metacontextual

The academic exploration of Islam within anthropology is often expected to choose between non-secular and non-religious analytics. Focusing on the Muslim engagement with the Qur'an, this paper repositions anthropological inquiry beyond this dichotomy. I argue that the interplay between the contextual and the extracontextual is always mediated by metacontextual practices among Muslims. Conventional understandings of Islamic unity, often assumed to stem from an extracontextual adherence to the Qur'an and other scriptures, and Islamic diversity, usually attributed to contextual reinterpretations, overlook this metacontext. Drawing attention to this missing theoretical element, the paper challenges the assumption that the contextual is a phenomenological-cultural given and the extracontextual is a textual-theological given. While central to the linking of these two elements, the metacontextual—I argue—is always elusive and never fully contextualized. This quality of the metacontextual (the indeterminate context of context) opens up a new horizon for the anthropology of Islam to craft an analytic that is neither secular nor religious.

Presenter(s): Yunus Doğan Telliel

The Focolare Movement: Chiara Lubich's Vocation to Unity

The Focolare Movement was founded in 1943 in Trento, Italy, by Chiara Lubich and her friends during World War II. Seeking an ideal worth living for amid the turmoil, they found their answer in God. Unlike traditional religious orders, they embraced their faith as laypeople, forming intentional communities known as focolares. This group grew to become one of the most significant lay movements within the Catholic Church, fostering ecumenical dialogue among various Christian denominations and with other religions, including Judaism, Islam, and Buddhism. The Focolare Movement offers valuable perspectives on how the Catholic Church addressed the secularization of nation-states in the 20th century.

Chiara articulated the movement's mission as striving for a United World, resonating with the Gospel's call for unity, "They will all be one" (John 17:21-23). This paper explores how Chiara and her companions deepened their understanding of unity—from the nature of God's love to its role as a unifying force for all people and creation. She viewed even Jesus' abandonment on the cross as a pivotal moment to rebuild connections between God and humanity and within society. By promoting unity through a trinitarian model, Chiara engaged with diverse groups, reshaped the Catholic Church, and impacted Vatican II. Today, Focolarini actively advocate for peace and unity globally, whether among indigenous communities in the Amazon or institutions like the United Nations and Wall Street.

Presenter(s): William Calvo-Quiros

The Cry and the Silence of Unity: Liberationist Legacies in Southeast Pará, Brazil

This paper draws from my forthcoming book, which charts how a will to unity and a sense of its precarity, what I call "the mystic of friendship," has been shaped by multiple Catholic theologies and has animated the colonization of a Brazilian Amazonian highway. I focus here on the legacy of one theology mobilized along the highway, Liberation Theology, whose intense focus on unity

echoes as much in today's mystic of friendship, as it has helped shape a simultaneous embrace and rejection of politics among settlers.

I make this argument through an analysis of images that were published in a liberationist newsletter produced by clergy along the highway from 1980. Through these images, especially of crucified individual peasants and of unified peasant collectives retaliating against oppressors, the newsletter promoted a politics of fraternal unity that radicalized post-Vatican II theology. Yet I demonstrate that these images, and liberationism more generally, despite promoting unity, allowed older allegorical associations among disunity, evil, and the devil to persist. In short, liberationism helped divinize friendship, while (an always divisive) politics remained potentially diabolical. I conclude that a theology—or a theologically-attentive anthropology—aiming to support political transformations over time must be able to articulate how differences are integral to unity. Otherwise, both make unity vulnerable to division and its allegories.

6389 Changing Landscapes: Community-Engaged Participatory Methods in Environmental Research

Start Date: 11/21/2025 4:15 PM **through** 11/21/2025 5:45 PM

Venue: Marriott **Room:** Galerie 4

Type: Roundtable/Town Hall

Environmental and academic landscapes alike are changing rapidly, creating a growing sense of uncertainty. Will the environments we study, along with anthropology itself, become mere ghosts of their former selves in the future? In this panel, we invite participants to imagine such a future and consider the potential and various ways in which participatory methods can help anthropologists, practitioners, and communities alike navigate and address these unique challenges. Community-based and participatory methods are central to anthropological thinking and practice- now more than ever- as they allow us to identify a community's most pressing social and environmental challenges on a relatively short time scale (Radonic et al. 2023), making the most of limited financial resources.

This panel brings together a diverse group of scholars whose work applies innovative participatory methods to a range of environmental subjects, including water insecurity, toxic environments, disaster response, food systems, energy justice, and climate change, to discuss why participatory methods are more critical now than ever before, as well as what new challenges participatory methods are likely to face in this uncertain future. We ask: 1) How can participatory methods enhance anthropology's potential to tackle contemporary environmental challenges?, 2) How might participatory methods serve as a means of resistance within systems that abandon environmental rights and protections?, 3) Which methods may be most useful and in what ways?,

and 4) What specific challenges are participatory efforts expected to face and how can we navigate them to continue pursuing equitable and inclusive environmental futures? This panel aims to answer both the philosophical questions of how and why this work should be done, and to identify some concrete means by which to do it, with panelists drawing on their experiences using a variety of innovative participatory methods to identify and address community needs.

Radonic, Lucero, Cara Jacob, Rowenn Kalman, and E. Yvonne Lewis. 2023. "It's a Sprint, Not a Marathon: A Case for Building Short-Term Partnerships for Community-Based Participatory Research." *Qualitative Research* 23 (2): 380–98. <https://doi.org/10.1177/14687941211029477>.

3691 Political Subjectivities in a Time of Ontological Threats, Trauma, and Social Turmoil

Start Date: 11/21/2025 4:15 PM **through** 11/21/2025 5:45 PM

Venue: Marriott **Room:** Galerie 6

Type: Oral Presentation Session

At a time of extraordinary political turmoil and violence, this session probes the way people cope with ontological threats, interpret the personal meanings of political rhetoric, deal with psychic tensions and conflicts fed by collective and individual trauma, and experience collective protests. These papers implicitly or explicitly distinguish subjectivity from the kind of subjectification that is a legacy of an early Foucauldian conception of power as discursive formations that render people governable subjects. Instead, these person-centered accounts explore personal shifts, meaning making, and coping strategies as shaped by unconscious as well as conscious processes and unique life experiences in settings of changing power structures, clashing discourses, and social connections or disconnections. Cases examined include US voters' ways of interpreting immigration and social welfare policies and the current administration of President Trump; affective solidarity among Haitian and Mauritanian refugees and asylum seekers in the American Midwest; the emergence of political awareness among adolescents in the US-Mexico border zone in the context of symbolic and physical violence from peers and politicians; the appeal of radical ideologies of utopian justice; the intergenerational guilt of a Spanish man; and the sensorial experiences of Israelis demonstrating against Prime Minister Netanyahu's conduct of the Gaza war. These are interpreted with theories that include critical phenomenological, feminist, and psychodynamic approaches to bodily orientations and socioemotional atmospheres defined by

political ethos (Jenkins 1991, 2015, forthcoming), theories of cognitive compartmentalization and integration (Strauss 2004, 2012), problematizing embodiment and sensorial experience (Csordas 1990), moral and cultural critique (Keane 2020), and a hauntological analysis of the impossibility of perfect justice. This panel showcases differing ways psychological anthropologists are contributing to a deeper understanding of this perilous moment.

Presentation(s): Political Subjectivity as Orientation and Atmosphere

Political subjectivity is of growing interest within psychological and medical anthropology. In this paper, I argue that within any political ethos the constitution of political subjectivity takes place at the nexus of orientation and atmosphere. In this formulation, orientation defines subjectivity's intentional directionality in terms of value and desire (Ahmed 2006), while atmosphere defines the socioemotional space in which that orientation takes place in terms of power and position. I demonstrate this through research that utilizes an ethnographic, phenomenological and psychodynamic approach for a study with adolescents in the US-Mexico border zone. The political subjectivity of these students is constituted by an orientation toward personal relations and ethnic identity in an atmosphere defined by being students in a "fight school" and in a community where there is constant jeopardy of deportation by immigration authorities. I conclude with the suggestion that fleshing out processes of self, will, and development/socialization at the nexus of orientation and atmosphere offers a means for advancing the theorization of political subjectivity within psychological/medical anthropology and allied fields.

Presenter(s): Janis Jenkins

Encountering Hostility: Shared Affectivity and Emergent Political Subjectivities among Migrants in Trump's America

The heightened immigration enforcement policies of the Trump Administration, alongside widespread racist and xenophobic rhetoric, have created an atmosphere of fear and anxiety within which migrants in the United States—particularly those with precarious legal status—must navigate their everyday lives. Drawing on ethnographic work with Haitian and Mauritanian migrants in the American Midwest, this paper explores the quotidian strategies, both visible and invisible, that these migrants enact as they encounter and maneuver through this hostile landscape. The paper frames emotions and affect—personal and collective—as central to lived experience and as key social and cultural forces that underpin the formation of subjectivities in this context. While recognizing the ways in which the state production of fear and anxiety may inhibit social action and curtail migrants' sense of belonging, this paper focuses instead on the ways in which this political

atmosphere simultaneously catalyzes forms of affective solidarity among these migrants, generating new sociopolitical relations and subjectivities. Ultimately, this paper emphasizes the centrality of affect in theorizing political agency and subjectivity and underscores the irreducibility of people to any fixed identity or subject position, including the figuration of "migrant" or "refugee."

Presenter(s): Bridget Haas

Making Sense of US Public Opinion About Immigration, Social Welfare, and the Trump Administration

In 2000 and 2005 I interviewed a diverse array of North Carolinians about immigration policies and government social welfare programs. I found that few were ideologically consistent. Instead, they constructed opinions on these topics from mixtures of conventional discourses and schemas across the political spectrum. Some of these elements were processed more deeply than others (Strauss 2012). Since that time, political polarization has increased in the US, and immigration policies and government social welfare programs have become more controversial. The paper presents the results of preliminary research with economically, racially, and ethnically diverse Americans about immigration, social welfare policies, and the Trump administration. I will examine the conventional discourses and schemas my participants draw upon now and whether my previous finding of lack of ideological consistency continues.

Presenter(s): Claudia Strauss

Hauntology and Political Subjectivity: Rethinking Power and Meaning with Absence

I have conceptualized political subjectivity as the entanglement of subjectivity with systems of power, meaning, and history. Subjectivity in this sense emerges through collective structures that define and constrain identity, agency, and experience. This paper aims to refine that conceptualization by integrating hauntology as a fundamental dimension of political subjectivity. I argue that subjectivity is conditioned by spectral forces – invisible absences, erased possibilities, silenced desires and unresolved pasts that actively shape the present. The political subject is therefore not only embedded in contemporary structures, but haunted by what those structures exclude – lost futures, foreclosed desires, and histories that persist as silent yet influential forces. Political subjectivity must therefore be understood as both a structured formation and a haunted condition, shaped by the tensions between presence and absence, between what is and what could have been. Rereading political subjectivity through hauntology offers a sharper lens to examine how power, meaning, and history remain haunted by the ghosts of silenced voices. This theoretical framework will be grounded in the case study of Álvaro, a Spanish man whose psychic struggles, rooted in intergenerational guilt, historical silence, and inherited complicity, offer a vivid illustration of how spectral histories and erased narratives become entangled with the sense of self and lived experience.

Presenter(s): Sadeq Rahimi

The Work of Protest: Experiencing the Body, Communitas, and Moral Spectacles in Political Demonstrations

Based on participant observations, I reflect on sensorial experiences, feelings, and thoughts that arose in my and others' bodies in more than two years of demonstrations against Prime Minister Netanyahu and the government in Israel-Palestine. I explore how participants' bodies express, challenge, and form alternatives to the war's traumatic effects and the refusal of the Israeli government to strike a deal with Hamas, return the hostages, and end the war. Protestors' sensorial experiences are embedded in their seeing, hearing, touching, tasting, smelling, dancing, chanting, and moving bodies. Some senses take a leading role, especially seeing and creating materials and bodies to be watched and invoking and listening to voices, noises, and moral explorations and debates. Organizers, the police, rivals, and politicians try to impact participants' bodies, and participants respond and create their own interacting individual and collective bodies. I follow a critical and pragmatic psychological anthropology that questions how bodies act not just as "black boxes" or transparent sites of pre-given bio-psycho effects of given political and social powers and shared meanings and symbols. Instead, I explore how politics resonates in participants' diverse bodies and how various participants respond with experiences, feelings, interactions, and movements in the urban and other spaces, actively shaping new political awareness, forms, and meanings.

4051 An Ethic of the Ghostly Bureaucracy: Rethinking the Paralysis Care Apparatus in an LA County Hospital

Start Date: 11/21/2025 4:15 PM **through** 11/21/2025 5:45 PM

Venue: Marriott **Room:** MGB - Salon B

Type: Oral Presentation Session

People with disabilities are often placed within structures that serve to collapse their personhood into digestible objects for biomedical consumption (Fein 2020). This can result in instances such as that described by Nancy Mairs (2008, 4), who is confronted by her doctor about neither getting pregnant nor taking birth control, noting that he "did not, of course, suggest how I was to accomplish the former without resorting to the latter." Such "veiled judgments" pervade the lives of women with cerebral palsy (Mairs 2008, 7). While the anthropology of bureaucracy has shown that such bureaucratic structures are often laden with paradoxes (Fleming et al. 2021) and instances of institutional obstruction (Mulligan 2017), it is clear that people with disabilities can often experience a "whittling away" of disability rights much more easily (Davis 2002, 2). Bureaucratic detachment can also result in various forms of abandonment. Furthermore, the bifurcated nature of bureaucracy creates moments of policy invisibility that this session refers to as "ghostly," as it continuously and selectively obscures various goals and metrics.

This session brings together a team of anthropologists investigating the various programs and care infrastructures at one large paralysis rehabilitation hospital in Los Angeles County. The ghostly

bureaucracy is brought into full relief as we discuss the dynamics and tensions that emerge between different programs as administrators and medical professionals attempt to deliver the best care for their patients. The team focused on the entire paralysis care apparatus there, drawing our attention to issues such as community integration, overall well-being, mental health, care/giving and rehabilitation, bowel and bladder management, and community violence prevention.

By focusing on the care apparatus, this team-based approach to ethnography will illustrate moments where the ghostly bureaucracy shifts and bends, and the effects of these transitions on patients and staff alike. While seemingly arbitrary, the disaggregated nature of bureaucracy means that different organizations within it can act consonantly within those specific duties that fall under their purview. However, across agencies, they may act in mutually contradictory ways, simultaneously aiding and harming certain individuals (Gupta 2012, 24). Tess Lea's *Wild Policy* (2020) has illustrated how these kinds of bureaucratic rationales can create invisibility and abandonment for those left to navigate them. The goals of this session are to:

- Highlight the workings (and nature) of the entire rehabilitation care apparatus;
- Illuminate the ethics of care at play at a large rehabilitation hospital from a multi-disciplinary (and multi-sited) perspective; and
- Provide guidance on a holistic team-based approach to ethnography.

Presentation(s): Rooted in Absence: Community Gardens as Spaces of Holistic Healing for Physical Rehabilitation

This research examines community gardens as holistic interventions for marginalized communities facing interconnected health challenges, focusing on a rehabilitation center's restorative garden in LA County. Communities disproportionately impacted by economic inequality, health disparities, and environmental injustice live in adverse syndemic conditions that reinforce negative health outcomes and inhibit social support systems. Community gardens emerge as multifaceted healing spaces that address these complex challenges by fostering social interdependence, preserving cultural identity through food systems, and creating supportive environments for mental wellness and physical rehabilitation. This study uses ethnographic fieldwork to explore how community gardens provide healing through inclusive health practices for those with paralysis or mobility impairments. Drawing from frameworks in critical disability studies that question normative assumptions about bodies, minds, and capabilities, this work strengthens the foundation for understanding the inclusion of community-based solutions in disability care programs. Community

gardens serve as therapeutic landscapes and resistance sites where marginalized individuals reclaim agency over their bodies, health narratives, and food systems under bureaucratic environments that have historically limited patients' self-determination. These spaces address the whole health of unseen communities while dismantling barriers to participation.

Presenter(s): Gabriela Rodriguez Delgado

Dispelling the phantasm of independence: A qualitative study on agency in rehabilitative care

Becoming disabled later in life changes not only daily activities, but one's agency. Between in-patient, home, or peer and community led care, how can one mitigate the internal dilemma of chasing the ghost of their able-bodied self; learning new goals and asserting their power in a world that infantilizes and pushes aside the nonstandard? Taking from prior works in medical anthropology and disability studies that highlight anticolonial scholarship when discussing interdependency, and the need to decompartmentalize care from the current care-giver/care-receiver dichotomy, this paper aims to critique commonplace care networks versus more holistic systems. Relying on interviews, focus groups, and participant observation with patients and caregivers at a large rehabilitation hospital in Los Angeles, I detail the benefits of patient-led care, along with highlighting areas where it already takes place. In doing this, my research will call attention to pathways that others can follow in the endeavor to not only thrive while disabled, but to reintegrate into their communities using the concept of interdependence to revive the agency able-bodied society erroneously attributes to living wholly self-sufficient.

Presenter(s): Taylor Galuppi

Paralysis Patients and Biomedical Technoscience: An Ethnographic Oral History Project

This paper is based on oral history, archival, and ethnographic data focused on the relationship between paralysis patients and supportive technologies. This paper takes an approach that centers the process of biomedicalization - the reciprocal transformation of people and technology often mediated by salient cultural signals - which best explores the entire care assemblage implicated within highly institutionalized and bureaucratized settings. Drawing on case studies from diverse paralyzed patients at a rehabilitation hospital in Los Angeles County, this paper explores the techno-personal relationships at play and how various standards (professional, technological, interpersonal, and cultural) shape experience. This paper engages with intersectionality, showing that gender, race, and age are salient factors due to how these broad categories engage disabled personhood in very different ways. Exploring issues of trauma, discrimination, and social abandonment, findings from this study help suggest novel approaches to rehabilitative care that are more interdependent and less institutional.

Presenter(s): William Lucas

Living with Disability: Relationships, Coping, and Community at a National Rehabilitation Hospital

This research investigates how people with disabilities build relationships, cope with challenges, and find support, and how care systems often fall short, particularly when individuals face

intersecting issues like housing insecurity and substance abuse. Through ethnographic research at a national rehabilitation hospital in Los Angeles County, this paper interrogates bureaucratic healthcare spaces and their ability to accommodate the full complexity of disabled lives. To understand these care gaps, I draw on critical medical anthropology and critical disability studies to explore the sociocultural dimensions of illness and disability. Using participant observation and semi-structured interviews with staff, patients, and family members, this investigation reveals how patients, caregivers, and staff navigate extra-institutional systems shaped by policy, inequality, and often ableist social norms. Rather than viewing disability solely as a clinical category, this research emphasizes its social and relational dimensions, especially as many patients develop deep bonds, friendships, romantic relationships, and improvised mutual support systems that help them cope with trauma and marginalization. These connections are revealed through ethnographic moments showing that healing is not only physical, but also emotional and communal.

3641 Spectral Beings: The Ghosts of Plants Past, Present, and Future in Virginia Nazarea's Botanical Lifeworlds

Start Date: 11/21/2025 4:15 PM **through** 11/21/2025 5:45 PM

Venue: Marriott **Room:** MGB - Salon C

Type: Roundtable/Town Hall

Anthropological engagements with plant-human relations have long demonstrated the centrality of plants to world-making projects. As biological allies of empire, settler colonialism, and plantation economies, plants have shaped the contours of land, labor, and law. As kin, they have nourished bodies, linked generations, and carried cultural memory across time and space. Their materiality is undeniable; they are cultivated, consumed, regulated, and resisted. Yet, plants also dwell in the spectral. They haunt and are haunted, embodying loss, longing, and the enduring presence of past relations.

This roundtable honors the work of Virginia Nazarea, whose scholarship has traced the entanglements of plants, people, and memory with striking ethnographic depth. Across decades, her work has prefigured and shaped key movements in anthropology, including the species turn, plant turn, and ontological turn. In doing so, she has drawn attention to plants not only as ecological and economic actors but as spectral beings: carriers of histories, kinships, and futures otherwise foreclosed.

Nazarea's work reveals how plants, much like ghosts of loved ones, refuse to disappear. The dizzying variety of cultivars she documents are refracted spectra of human-plant relations. In her writing, plants are living testaments to adaptation, resilience, and reciprocity. They bring longed-for places and peoples into the present through taste, smell, and embodied practice. Their ghostly presence unsettles the forced forgetting of industrial agriculture, buffering against epistemic and

ecological erasure. If dominant narratives of agricultural modernization center loss, Nazarea's work insists on recuperation. It points to the spectral as not only haunting but generative.

Bringing together mentees, colleagues, and scholars influenced by Nazarea's work, this roundtable explores how plants orient us in the world and seed possibilities for lifeways otherwise. How does memory sustain the botanical lifeworlds she so carefully documented? How do plants carry forward human and more-than-human histories, making themselves felt in kitchens, gardens, and diasporic homes? How might we, following her legacy, remain attuned to the spectral presences that shape our shared futures?

1544 Engaging the 20th Anniversary of Katrina in the Spirit of Critique (and with soul(s))

Start Date: 11/21/2025 4:15 PM **through** 11/21/2025 5:45 PM

Venue: Marriott **Room:** MGB Salon D

Type: Executive Roundtable/Townhall

This roundtable is inspired by our recent collaboration on the 25th anniversary issue of the Black Studies Journal, *Souls*. The central theme of the issue -- Divest/Invest -- has guided our analysis of what it means to memorialize Hurricane Katrina twenty years after the storm. Thinking with this year's AAA theme, we consider the ways in which the 20th anniversary of Hurricane Katrina serves as an opportunity to refuse romantic tales of haunting while allowing ourselves to be possessed by the ghosts of scholars, interlocutors, and struggles past who already told us what time it is. Refusing a reading that renders the man-made disaster and racial violence of Katrina as singular or exceptional, we engage the two decades of material and political change in the region since as dialectical processes constitutive of ongoing local and global struggles through which racial capitalist hegemony revolutionizes. The accumulation of and attendance to political and material crises in these years open on to a historical conjuncture that reveals the dynamic entanglements between late neoliberal multiculturalism and the acceleration of (a more overt and centralized) natalist/techno authoritarianism. What can the shifts in political ecologies and political economies (capital and social investment/divestments) and forms of organized resistance and everyday inhabitation of this region tell us about the struggles of today? By engaging the radical traditions that place the Gulf South in relation to the Global South, we take up the intellectual works of W.E.B. Du Bois, Manning Marable, Walter Rodney and Clyde Woods to frame "post-Katrina" as a site

to elaborate anti-imperialist and anticapitalist critique.

5065 Living at the Edge of Vanishing Present: Anthropological Reflections on Haunting and Precarious Ecologies

Start Date: 11/21/2025 4:15 PM **through** 11/21/2025 5:45 PM

Venue: Marriott **Room:** MGB Salon E

Type: Oral Presentation Session

This panel explores how precarious ecologies-destabilized by extraction, climate change, militarization, economic diversification, and ethnic conflict-engender temporalities marked by suspension, erosion, fear, and haunting. In such contexts, communities live in what might be called a "vanishing present" (Gallop 2011), where futures are deferred and the past returns not as continuity, but as ghosts. These conditions abandon certain human and non-human lives to death, generating zones where sovereignty itself appears spectral, fragile, and contested.

Drawing on ethnographic investigations from diverse ecological frontiers (Tsing 2003), panelists examine how people live with and against these exceptional temporalities. Following Nugent and Suhail's (2024) notion of "cultures of extinction" and their framing of sacropolitics-where communities are compelled to transform in order to survive-panelists reconsider the political stakes of ecological precarity and the role of anthropology in understanding and unsettling these transformations.

The panel asks: How do communities inhabit and make sense of environments where futures are foreclosed or indefinitely deferred? In what ways do ghosts-whether as memories of the dispossessed, traces of destroyed landscapes, or infrastructures-shape contemporary struggles over land, resources, and belonging? What everyday practices of transformation do people adopt to forge belonging or build new social orders in contexts of loss and exposure?

Panelists offer ethnographic insights from across geographies. One examines how internally displaced Pashtun women in Pakistan inhabit a vanishing present while resisting the crisis imaginary that frames the frontier as a site of cultural extinction. Another explores "Maasainess" in contemporary Kenya through economic diversification strategies, revealing how conservation, land titling, and development reshape identity and territorial claims. A third paper follows the figure of the "zombie fish" - invasive species thriving in warming Arctic waters-to theorize multispecies life and extinction in the Deatnu river system. Another panelist reflects on the Santhal Adivasis of eastern India, whose participation in resource extraction involves bargaining with death, as they are drawn into precarious economies of sacrifice. Finally, a paper from Cotabambas, Peru rethinks

mining's bodily impacts-not through linear toxicologies but through the embodied, multispecies experiences of exposure and resistance.

Rather than framing spectral presences solely as losses to be mourned, the panel considers how haunting reveals alternative ways of living, knowing, and contesting dispossession. Attentive to the interplay between the political, material, and spectral, contributors ask how anthropology might engage ghosts not as residues of the past, but as active agents that unsettle dominant frameworks of governance, sovereignty, value, and knowledge.

Discussant: Jennifer Coffman, James Madison University

Presentation(s): Metal Fences, Concretized Discourse, Shifting Properties: Haunting Ideals of Maasai Pastoralist Mobility in Contemporary Kenya

Rural, self-identifying Maasai living in formerly predominantly pastoralist communities in Kajiado County, Kenya, are adapting to land division and restricted mobility in a variety of ways. Through a case study based on the disaggregation of a group ranch, this paper examines economic practices and justifications, as well as ties to the past, as people respond to shrinking average per capita landholdings and growing financial pressures and desires. Some are selling newly titled parcels to the highest bidders, some are hoarding land and increasingly becoming culturally isolationist, and some are actively promoting and participating in new conservancies and embracing, at least somewhat, a form of green governance. These various economic diversification strategies speak to the pressures of the three interrelated forces of conservation, economic diversification, and land titling, which are overlain with haunting ideas of what it is to claim Maasainess in contemporary Kenya. Political ecology provides a guiding framework to analyze the articulation of local and global forces; the emergence of new forms of political agency; the evolution of identities tethered to constructs of authenticity; the production of knowledge; and the evaluation of resistance, attempts to theorize nature, and discourses of development (Robbins, 2020; Brosius 1999).

Presenter(s): Jennifer Coffman

Crisis as Chronology: Feminist Ethnography from Pakistan's Frontier

This paper examines how internally displaced Pashtun women from Pakistan's former Federally Administered Tribal Areas (FATA) inhabit what might be described as a "vanishing present"—a suspended temporal and political condition forged through decades of militarization, frontier exceptionalism, and state neglect. Based on long-term ethnographic and digital fieldwork in the urban centers of Peshawar and Islamabad, this research explores how crisis in Pakistan's frontier regions operates not as a discrete event but as a governing condition. Drawing on Masco's (2017)

notion of "crisis talk" and theories of suspended temporality (Roitman 2014), I analyze how the state frames regions like FATA as perpetual sites of emergency—zones where the future is always deferred and survival is valorized over political inclusion or mobility.

Pashtun women, already marginalized at the intersection of ethnicity, gender, and geography, navigate this vanishing present by refusing state pressure to return "home," and by pursuing higher education, and participating in digital activism. These quiet but strategic actions challenge the crisis imaginary that renders the frontier as a space of cultural extinction and social stasis. Instead, they reframe displacement as a site of transformation—where political agency is practiced not only through protest, but through presence, persistence, and refusal.

Presenter(s): Zainab Najeeb

Between Death and Dying: Adivasi Self-Making in the Vanishing Present of a Resource Frontier in West Bengal, India

This paper explores the entanglements of death, dying, and self-making among Adivasis/indigenous people living in a resource frontier in West Bengal, India. Set against the backdrop of ecological degradation, land dispossession, and the expansion of extractive economies on Adivasi land, the paper examines how Santhal communities navigate the blurred line between life and death—not only as a biological process but as a political and existential condition. Drawing on ethnographic fieldwork of an accidental death in the quarries and how customary mediators mediate death as way to restore the order of Capital in the region, this paper highlights how Adivasi practices of dispute mediation produce alternative temporalities and forms of personhood amid the structural violence of the present. The paper asks: What does it mean to live when the future is foreclosed, and how do practices of dying become central to the making of political selves? This inquiry illuminates the vanishing present as both a temporal register and a condition of possibility for Adivasi life.

Presenter(s): ROSHNI CHATTOPADHYAY

Zombie fish: ecosocial future-making at the edges of repair

In Deanuleahki – an Arctic river valley in Sápmi, the transborder Indigenous Sámi homeland – the intergenerational practice of salmon fishing is in flux amidst the decline of Atlantic salmon stocks, their accelerating replacement with high-risk invasive species, and stringent state regulation of traditional and subsistence fishing. In the local striving to reclaim and remake knowledge systems, kin relations, and distributive practices surrounding subsistence fishing and the fluvial ecosystem, quotidian practices intergenerational and interspecies care collide with the planetary process of cryosphere collapse.

In this ethnographic essay, I examine the irruption, into the Deatnu river system, of invasive species that thrive in rapidly warming Arctic waterscapes. I particularly trace it through the figure of the "zombie fish." The humpback salmon biannually rush the river by the hundreds of thousands, slowly decomposing while still alive. Upon its death, it fills the shorelines with decaying fish to be buried to

contain the threat of contamination. I interrogate local efforts to catch and bury the undead humpback en masse, and the narrowly permitted application therein of previously banned traditional fishing methods. In these efforts, the striving to reclaim fishing livelihoods and the attendant collaborative care practices for livable interspecies futures collides with the hard edges of ecosystem collapse amidst the climate crisis.

Presenter(s): Annikki Herranen-Tabibi

Exposure and loss: a bioethnographic approach to mining's impacts in Peru's Southern Andes

In Peru's Southern Andes, industrial copper mining activity has raised serious concerns about possible exposure to heavy metals through water, soil, air, and other sources. Such exposure raises risks of multiple negative impacts on human health. It also prompts inquiry into how environmental degradation brought forth by mining becomes embedded in everyday practices and embodied experiences. This paper is based on a pilot study that draws from a bioethnographic approach (Roberts & Sanz 2017) to evaluating toxic metals exposures and their embodied impacts amongst three indigenous communities in Cotabambas, Apurimac. In this study, an interdisciplinary research team (toxicology, geochemistry, and cultural anthropology) collaborated with residents to identify possible sites and pathways of heavy metals exposure. Through participant observation, semi-structured interviews, community mapping walks, and elemental analysis, this pilot study takes lived, embodied experiences of exposure as the starting point for scientific inquiry into mining's impacts on bodies, lands, waters, and multispecies companions in Cotabambas. In doing so, this participatory research methodology resists the reducibility of exposure to linear scales of dose-dependent toxicity. Rather, it integrates ethnography and bio-geochemistry to examine exposure as a framework for experiencing and understanding the impacts of mining on bodies and environments in Peru's Southern Andes.

3934 Haunted Health: Untaming gloomy prognoses, lingering resonances, and folded temporalities in experiences of health, care, and illness

Start Date: 11/21/2025 4:15 PM **through** 11/21/2025 5:45 PM

Venue: Marriott **Room:** Regent

Type: Roundtable/Town Hall

Biomedical science aims to tame the unsaid, the uncertainties, the gloomy prognoses, the colonial hauntings, and structural violences that linger behind its diagnoses and hospital rooms. In contrast, anthropology that approaches these experiences as haunted puts ontological focus on the pitches and sensations emerging through circulations of forms, of present and non-present elements. In

this roundtable, we explore how healthcare experiences can embody particular forms of hauntings. We consider how untaming these affective, spectral elements holds promise for approaching the hidden, the absences, the invisible, and what lingers, and their influences on health and illness in and beyond institutional settings. What experiences might we understand better if these elements are untamed? What might anthropology that engages haunting beyond hauntology bring to studies of healthcare experiences?

Health, for instance, always unfolds under the spectral possibilities of disease. Disease, trauma, or health crises conjure particular temporal, spatial, and affective ghosts that healthcare infrastructures and epistemologies struggle to understand and may try to contain. For example, contemporary neurological research emphasizes the brain and its materiality, eliding the role of psychological and social factors in illness. Reverberations of deep-seated notions about mind, agency, and responsibility linger around clinical interactions, as do notions of what is real and unreal with regard to the body and who has the power to claim its knowledge. Attending to how elements from different times and spaces fold into healthcare experiences—and approaching these as untamed hauntings—can help anthropologists engage with interplays of space, place, memory, temporality, and ideation that exist outside the immediately apparent, yet touch and shape people's lives in significant ways.

This roundtable brings together anthropologists working on diverse iterations of healthcare experiences, including transcultural psychiatry, infrastructural hauntings, political and moral economies of pain care, medically unexplained symptoms, memory, and experiences in the wake of crises. We consider how haunting elements connect healthcare experiences and take shape through the materialities of health and care. What specific ghosts are encountered along certain care pathways? How can centering on the hauntings of disease, trauma, and health crises provide epistemological groundings to understand what is absent, invisible, or what lingers behind experiences? How can notions of temporal and spatial folding help us understand the uneven impacts of systemic changes to healthcare provision? Bringing these topics into conversation offers valuable guidance on what untaming haunting elements may reveal to anthropologists studying lived experiences of health, care, and illness.

2959 Contested Grounds: Land, Rent and the Politics of Distribution

Start Date: 11/21/2025 4:15 PM through 11/21/2025 5:45 PM

Venue: Marriott **Room:** Studio 10

Type: Oral Presentation Session

This panel examines the politics of land rent. While rent has been theorized as a structural feature within circuits of capital (Harvey 1982; Ward and Aalbers 2016), comparative studies have revealed diverse regional configurations through which property, land, and value are interrelated.

Anthropologists and others have examined how states enable and control land monetization (Coronil 1996; Shatkin 2017), kin relations mediate flows of revenue from landed property (Shipton 2009, Palomera 2014), and property tenure systems are transformed in relation to emergent moral discourses and economic relations (James 2007; Li 2014).

Taking rent as a broad analytic concept to refer to the "economic form in which landed property is realised" (Marx 1981[1894]:772), this panel considers demands for income from land across social contexts, and specifically, its integration within broader politics of economic distribution. How are different forms of income from landed property - a seasonal share of wheat from the harvest, a monthly housing payment, or a quarterly corporate dividend - produced through particular social and institutional processes? In addition to individualist property models, how are overlapping, collective, or partible rights to land renegotiated through contestation over its income? And what is the distinct role of land rent in relation to broader regional histories, political economies, and forms of governance?

We invite papers which examine the breadth of practices through which income is generated from land, with particular attention to "people's own categories" (Guyer 2004:138) for mapping these processes. Papers might explore a) the institutions and processes through which land is made into rent-producing property, b) the social relations in which rent is embedded (including multiple and overlapping property regimes) and changing forms of social stratification, or c) the political and ethical discourses put to work to legitimize or contest these relations and their distributive politics. We invite papers addressing diverse geographic contexts and economic forms--from urban real estate markets to natural resource concessions.

Presentation(s): Settlement, Rent, and the Making of the Countryside in the Eastern Himalayas

In British colonial terms, "settlement," or land revenue settlement, was a process of enclosure, rent-setting, and rural governance. As a set of administrative techniques, settlement rendered Indigenous people and migrants alike into rent-paying tenant farmers and rural land into revenue for

the colonial state. Settlement was a process of making and maintaining a legible and governable countryside. Difference was naturalized in neat categories and embedded in discrete plots on the landscape. Settlement, however, was fragile. As a technical-administrative process, settlement had to be regularly recalibrated. This paper is about these recalibrations as they were rolled out in the Kalimpong region of the Indian state of West Bengal. It describes the colonial production of "fair rents" and how colonial administrators experimented on the productivity of peasant land and labor with an eye to increasing land rents, while at the same time maintaining a bucolic countryside that served as a contrast, and a reproductive outside, to the tea plantations that surrounded Kalimpong. The paper also traces the legacies of colonial settlement in the present to understand the fraught relationships between rent, tenancy, and belonging.

Presenter(s): Sarah Besky

Shares and the Proportional Distribution of National Wealth in Mongolia

Erdenes Tavan Tolgoi, state-owned mining company in Mongolia, is the largest coal deposit in the world. Since 2012, the Government has distributed shares of this company to every citizen, depositing dividends from these shares three times into people's bank accounts, generating a sense of collective ownership.

Recently, however, this distribution has been critiqued as a populist policy that masks the need for real investment and development. In December 2024 when dividends were last transferred the country faced electricity shortages and blackouts, heating disruptions, and severe air pollution. Individual profits from allocated shares were too insignificant to meaningfully impact people's lives. Social media posts labelled them an "insult" from an incompetent government.

When the nation state is the ultimate arbitrator of resources, what rewards are granted, for whom, and for what use? This paper explores the way in which lack of individual ownership of land and resources disadvantages people as individuals but secures the immunity and strength of the nation. It asks how already-existing categories and relationships to land can be amplified. In this light, how might the idea of 'share' or 'portion' be mobilised as a more just distributive political model that reconfigures the nation's relation to its people as one of custodian- or steward-ship. Furthermore, what reach does this idea have when structural issues hold certain forms of inequality in place?

Presenter(s): rebecca empson

Building Hype: Libertarian Cities, Fictitious Development, and Coercive Rentier Networks in El Salvador's "Bitcoin City"

In the past decade, Central America has become the target of libertarian city experiments. Adopted by two of the region's governments as a new development scheme, these projects have become frontiers of non-traditional forms of finance capital, such as cryptocurrency. Though emerging analyses highlight the role of libertarian cities as tax havens facilitating the circulation and hiding of capital, their role as spaces for land rent extraction has been less explored. This article examines

the question of land rent extraction and distribution for the case of Bitcoin City, a planned city announced by the government of El Salvador in 2021 which was described as a future financial center for crypto-asset investors.

Drawing on theories of spectacular accumulation (Tsing 2004; Searle 2016), I argue that rent extraction for the case of Bitcoin City is best understood through the project's function as a media spectacle. This spectacle is the result of an emerging ruling elite's attempt to build a development model around financial accumulation that gives meaning to an otherwise chaotic process of land speculation around tourism real estate projects. The latter incentivizes the formation of what Michael Levien (2021) calls "coercive rentier networks," that is, networks of rent-seeking actors engaged in speculative land deals through violent tactics. The emergence of these networks is tied to the postwar transformation of Salvadoran agrarian elites' and their relationship to land.

Presenter(s): Julio Gutierrez

Gas Rents and the Ongoing Struggle over (the) Excess in Bolivia

Bolivia's decline in ('natural') gas exports has led to a corresponding collapse in state distributions of various forms of rent. This follows upon fourteen years of relative growth associated with the left-leaning government of Evo Morales, the country's first Indigenous president. Though ousted in a coup in 2019, Morales' legacy – as with that of the gas boom – is central to the ongoing contestation over rents and redistribution in the country. This paper traces the past and present expressions of claims-making surrounding gas rents, focusing primarily on the tensions and contradictions between gendered circuits of access, revolutionary-nationalist discourse, and racialized stories of abjection, excess, and waste. Disputed ideas about the meaning and content of "excess" – or *excedente* – whether as surplus or waste, animate these stories. Despite the contradictions, stories of Bolivian gas rents reveal the persistence of a particular kind of political subject that adheres stubbornly to what Ferguson and Li have discussed as a claim to a "rightful share" to the public good. Even as gas rents decline, the imagined coming age of lithium energizes these stories once again. This political subjectivity, even when ideologically or socially contradictory, remains a serious challenge to capital's unfettered access to land rents in Bolivia.

Presenter(s): Bret Gustafson

"A Fair Return": Rent Regulation and the Limits of Reform in New York City

In New York City, over two million tenants pay rents set by the Rent Guidelines Board, an appointed body operating within a regulatory system that emerged from early 20th-century rent strikes but is now legally mandated to balance "affordability" for tenants with "fair returns" for owners. In fieldwork in the regulatory bureaucracy, I encountered conflicting responses to the Board's decisions—landlord groups sued the state, claiming rent-setting was unconstitutional seizure of property, while tenants frame the RGB as an extension of real estate power, using that narrative to influence mayoral races and mobilize voters. This paper focuses on the agency's staff, examining how their practices relate to what observers call the "real estate state"—the entanglement of local government and real estate capital defining NYC's post-1980s political economy. Drawing on

hearings, interviews, and voting records, I follow one bureaucrat's decade-long effort crafting a "perfect formula" to balance tenant wages and landlord profits. Tracked through spreadsheets, this off-hours project appears less a technical puzzle than a window onto the tension between the shadow of production and the ascendant claim of real estate—a relation, I argue, that constrains what the state can redistribute, and to whom. I suggest a different angle on distribution in anthropology—not one that sees the state as the origin of redistribution, but as constrained by the distributional patterns it claims to govern.

3666 Haunted Waters, Virtual Shores: Aquatic Imaginaries and Utopian Ruins

Start Date: 11/21/2025 4:15 PM **through** 11/21/2025 5:45 PM

Venue: Marriott **Room:** Studio 2

Type: Oral Presentation Session

This panel explores water as both medium and metaphor, fluid yet infrastructural, immersive yet elusive. Across digital landscapes, speculative architecture, underwater practices, migrant movements, and historical terrains, we trace how aquatic spaces mediate utopian American Dreams and their disintegration. When filtered through virtual pools, empty aqueducts, submerged wastelands, and surveilled borders, water becomes more than an element: it becomes a site of contradiction, anxiety, and ghostly resonance.

We begin with the Pool Rooms, a sublevel of the collaborative virtual horror mythos *The Backrooms*, where liminal architecture and pristine still water evoke both tranquility and uncanny disquiet. In this space, water is symbolic of a vanished ideal, one drenched in Californian dreams of leisure and futurity but emptied of human presence. Extending outward, we examine California's actual aquatic infrastructures, from postwar aqueducts photographed without water to the techno-utopian aesthetics that framed them. These images, brimming with the promise of modernist control over nature, reveal a sharp dissonance between imagined plenitude and present ecological precarity. We continue into submerged, industrial, and urbanized zones – seascapes shaped by dredging, pollution, extraction, and abandonment. From LA's artificially engineered beaches to toxic underwater zones haunted by the afterlives of industrial tuna canning and pesticide production, we consider how watery environments in urban spaces become sensorially and affectively charged by the uncanny archives of capitalist transformation and environmental degradation. We then investigate how water shapes contemporary migration in the Americas, both physically and metaphorically and at different scales, as it produces individual sensorial experiences and physiological responses, state migration management policy, and conflicting memories of transnational crossings.

Throughout the panel, we attend to how water resists containment, both physically and conceptually. We consider the political and affective work done in "passing through" water: its

liminality, danger, and non-place-ness. Water is at once a threshold, medium, and barrier. It has always functioned differently than land in how it is regulated, traversed, feared, and fantasized, yet continues to be theorized and governed in terrestrial terms. Water holds the potential for connection, separation, immersion, and disappearance alike, and in these submerged or simulated spaces, we glimpse the failure of the American Dream as refracted through its most fluid metaphor. Together, our presentations stage a dialogue between the virtual and the material, the utopian and the dystopian, the sensorial and the speculative. By foregrounding the spatial, affective, and historical dimensions of water across contexts, we ask what it means to live in the ruins of aquatic futurisms and what ghosts remain in the wake of their collapse.

Presentation(s): Underwater Ghost Towns: Tracing Presence and Absence in L.A.'s Urban Ocean

What lies behind and beneath the iconic beaches of sun-kissed Los Angeles? This paper draws on ethnographic fieldwork with freediving and spearfishing practitioners in California to investigate the presences and absences that haunt the shores of L.A.

Since the early 1900s, L.A.'s coastline has been fished out, dredged up, dumped into, and built over by various different boom-and-bust industries whose practices and infrastructures still leave ghostly traces on L.A.'s shores, waters, and inhabitants. Today, L.A.'s artificial beaches and overfished seas boast submerged DDT, radioactive medical waste, urchin barrens, toxic algal blooms, dissolved heavy metals, and dystopian dead zones. Nevertheless, marine beings and practices continue to survive – indeed some are even flourishing – in this haunted urban ocean.

How are these ghostly traces felt, sensed, perceived? This paper centers the embodied sensorial experiences of breath-hold divers and spearfishers who submerge themselves in L.A.'s ocean. Building on scholarship across environmental, multimodal, and phenomenological anthropology, I examine various socio-political-ecological processes that make L.A.'s urban ocean – and diving within it – what it is today. Drawing on underwater GoPro footage and interviews with divers, I trace the ways in which 'underwater ghosts' – industries, infrastructures, entities, and processes that are no longer present – nevertheless appear sensorially in L.A.'s underwater seascapes.

Liminal Waters: An Anthropological Exploration of the Pool Rooms

The Pool Rooms, a tranquil yet uncanny sublevel of the collaborative online virtual world known as The Backrooms, characterized by endless tile corridors, still water, and artificial lighting, evoke a

sense of resonance that blends nostalgia, serenity, and unease, and which is referred to colloquially as liminality within the community. I argue that the Pool Rooms function as a virtual heterotopia—an imagined space that both mirrors and subverts actual-world environments such as spas, hotels, and public pools—while articulating a broader affective response to late capitalist alienation and digital nostalgia. Drawing on ethnographic observations of online communities, game spaces, and user-generated media, I analyze how participants collectively construct, inhabit, and mythologize the Pool Rooms. These spaces resist traditional narrative structures, instead inviting contemplative exploration that fosters a shared longing for comfort in the sterile and depopulated architecture of the recent past. I explore how digital spaces like the Pool Rooms reveal changing relationships to place, memory, and identity through a discourse of liminality, a concept strangely borrowed from Victor Turner's examination of rites of passage. By foregrounding the practices and aesthetics that give life to the Pool Rooms, this paper contributes to emerging anthropological discussions on digital worldbuilding, affective atmospheres, and the imaginative geographies of online communities of practice.

Presenter(s): Robert Penner

California Water and the Infrastructural Sublime: The Photographic Archive of the State Water Project

At the time of its construction (1961–1968), California's State Water Project (SWP) was the largest water infrastructure project in human history—a behemoth network of aqueducts, dams, and pumps spanning 600 miles. It was heralded as an engineering marvel, and promised to rework the planet's supposed limits through technological mastery. This paper analyzes twenty photographs of the SWP's construction, drawn from the historical archives of the California Department of Water Resources. I theorize the visual logic in these photographs as depicting the infrastructural sublime—a rubric to analyze the overwhelming scale of this project, which produces an uncanny visual experience of infrastructural hope and fear. These images are not records of mere construction zones, but speculative sites of world-building that render a techno-utopian vision of California's future in which water flows endlessly. The empty concrete vessels index aspirational abundance, yet is haunted by the reality of its continued dwindling supply. Today, as climate change and over-extraction undo the future these photos once envisioned, the SWP's construction feels like scenes from science fiction: a Dune-like myth of planetary engineering, built atop the impossibility of perpetual water in the arid West. I argue that water will always be California's greatest ghost, a mysterious presence that flows, humbles, and haunts a state that can't avoid building bigger in spite of its limits.

Presenter(s): Ryan Jones

Bordered Waters: Currents of migratory movement at the Mexico-Guatemala border

Water, and its absence, haunt the histories of transnational migration through images of overfilled boats, mass drownings, and dehydration on nations' edges. This paper uses water as an analytic tool for understanding contemporary migration in the Americas, focusing on how the Rio Grande,

the arid Sonoran desert, and the humid jungles of Chiapas produce embodied vulnerabilities to environments and diseases that are differentially mediated by water. At the Mexico-Guatemala border, the Suchiate river and surrounding forests of Chiapas carries distinct memories of the Guatemalan civil war and mundane, everyday transborder flows between these countries. Under current border externalization policy, these realities meet the deterrent intentions of the U.S. state, transforming the site from one of informal commercial transport to a surveilled frontier like monitored by those that border the U.S and policed by its accomplices. Here, deadly currents, vector-borne diseases, and torrential rains threaten migrants' lives at this border, and the shifting carceral structures of multiple states push people away from and pull them towards predictable, trackable locations like a tide. Water thus shapes migratory movements both physically and metaphorically and at different scales as it produces individual sensorial experiences and physiological responses, state migration management policy, and conflicting memories of transnational crossings.

4341 Spectral Ecologies: Residues, Reverberations, and More-than-Human Forces

Start Date: 11/21/2025 4:15 PM **through** 11/21/2025 5:45 PM

Venue: Marriott **Room:** Studio 3

Type: Oral Presentation Session

Feminist and multispecies perspectives-from Anna Tsing's notion of more-than-human socialities to Astrida Neimanis's hydrofeminism and Michelle Murphy's theorization of alterlife and decolonial chemical relations-have offered anthropology powerful tools for rethinking human-environment relations as spatial, temporal, and affective entanglements that exceed the human. Collectively, they illuminate how relations across species, substances, and temporalities are always politically charged, historically situated, and materially uneven.

Extending these insights, the panel turns to spectral ecologies-those phantasmic and often elusive environmental phenomena that resist capture by conventional materialist or anthropocentric logics. From healing energies and harmful algal blooms to extreme weather events, spectral ecologies register environmental presences that flicker at the edge of perception, destabilizing linear notions of time, space, and matter. This panel is an invitation to think with non-humans as lively residues of past ecological actions-actions intricately bound with deep geological and atmospheric processes, colonial and imperial histories, secular regimes of knowledge, and ongoing capitalist extraction.

Presentation(s): Provincializing Energy in the Gobi Desert

Viewed by satellite, Sainshand, the capital of Mongolia's Dornogovi (East Gobi) province, appears as a swath of red in the middle of the camel-colored expanse of desert. This red-colored stone marks the location of Shambala Energiin Töv (energy center), one stop on a pilgrimage circuit where groups of pilgrims from the capital renew the vitality of bodies exhausted by the demands of a labor force still reeling from early 1990's neoliberal "shock treatment". The pilgrimage circuit situates particular sites of healing to places where the liveliness of stone can be sensed by the human body. This capacity to sense the liveliness of stone and martial it in service of a relationship of healing is enabled by pre-existing relations with landscape entities that the logic of industrial capital attempts to corral into combustible energy that can be translated into labor power. However, approaching the Energy Center on its own terms allows us to make space for particularities that may not fit within post-industrial, fuel-based understandings of energy. The concept of energi allows particularities to rush in, encompassing local understandings of energy and re-appropriating them into the capitalist framework while nevertheless exceeding it.

Presenter(s): Jessica Madison Piskata

Presentation(s): Haunting, Tourism, and Ecological Futures in Post-Tsunami Southern Thailand

How has the 2004 Indian Ocean tsunami impacted provincial lifeways in the Thai provinces of Phang Nga and Phuket, and how has this event also shaped the subsequent development of tourism up to the present day? I approach these questions through a sensitive and culturally-informed theoretical framework that positions the trauma and memories of the past tsunami event at the confluence of physical, environmental, and cultural factors, which include the coastal locations of the sites and the rich tradition of haunting and ghostliness present in Thai folklore. I seek to investigate how memories of the tsunami might present themselves in contemporary tableaux of local and tourist life through mediums such as ghost stories and public memorials, and how responses to the tsunami event may have affected regional economic and infrastructural changes through the present. Critically, I situate this research project against the ongoing global event of anthropogenic climate change and the human-natural disasters it foments, and seek to explore how cultural perspectives on tsunami past and present can shape future responses to climatic events and resilient Thai eco-futurities

Presenter(s): Moon Pankam

Presentation(s): From Prison Farm to Atlanta Forest: Dwelling with the Past in an Abandoned Landscape

From 2021-2023, "forest defenders" occupied a 517-acre woodland in southeast Atlanta to "Defend the Atlanta Forest" and prevent the construction of a privately-run police training center, known as

"Cop City." The forest was a powerful metaphor, orienting an emergent, heterogeneous community toward a common set of values and utopian images that could be regarded as ends in themselves (and in opposition to "cop city")—wilderness, deep ecology, autonomy, the sacred, *communitas*, and so on. It was often said that the struggle wasn't just about this forest but all forests everywhere. Yet, the "forest" was only a few decades old, having been a city prison farm for most of the twentieth century, and an antebellum plantation before that. It was shaped as much by natural processes as by the very social processes—plantation agriculture, slave labor, incarceration, capital accumulation—that the symbol of the forest was meant to oppose.

Based on two years of fieldwork, I examine how the American fixation on wilderness was challenged by the landscape of the Atlanta forest occupation. By attending to how and where people dwelled in the landscape—such as in thickets of invasive Chinese privet and among young pines growing on the abandoned prison farm fields—I sketch alternative images of the society/nature relationship emerging from this forest that confront the reality of human labor and of living with the past.

Presenter(s): Sasha Tycko

Spectral Developments: More-than-human Hauntings in a Special Economic Zone

In the Boten Special Economic Zone (SEZ), Laos, ghostly presences unsettle utopian development narratives. This borderlands' twenty-year transformation from sustenance farming village to violent casino zone to abandoned ghost town to node in China's Belt & Road Initiative (BRI) reveals how developers manipulate temporality to attract investment, despite material indications of failure. Yet, nonhuman actors continually disrupt these spatial-temporal enclosures. Mold plagues concrete buildings, dust from land clearings ages new constructions, and alleged ghosts of murder victims prevent locals from walking outside at night. Meanwhile, the protective spirits (*pii muang*) of displaced villages transgress boundaries despite ritual relocation, moving through dreams, possession ceremonies, and animal forms—challenging the finality of displacement.

My presentation explores development zones as contested terrains where multiple temporal orders clash. I propose that spectral ecologies are not only outcomes of environmental extraction—colonial border-making, Cold War bombing, and capital (un)development— but actively reshape land's material conditions. *Pii muang* embody ancestral relations to land that predate and outlast the SEZ's spatial and temporal manipulations. As visions of a Chinese world order materialize through BRI infrastructure, spectral ecologies destabilize secular, state-based understandings of land, temporality, and sovereignty.

Presenter(s): Natalie Ng

Data Gaps and Dead Zones in the Johor Straits: Spectral Algae and the Infrastructures of Toxicity

Harmful algal blooms (HABs) are sudden ecological events with devastating, often lethal effects. Caused by overgrowths of microscopic algae, they can kill vast numbers of marine organisms within hours, devastate fisheries, and render seafood inedible through the accumulation of unseen

toxins. Yet the harm of HABs exceeds toxicology: even non-toxic blooms kill through oxygen depletion, while multispecies blooms blur causal lines, making it difficult to identify a single responsible species. Currents and wind can rapidly concentrate or disperse algae, leaving behind only spectral traces—dead fish, disoriented communities, and disrupted ecologies.

This paper theorizes HABs as spectral ecologies: elusive environmental phenomena that defy stable classification and challenge anthropocentric logics of causality and repair. Drawing on ethnographic work with marine scientists and coastal residents in the Johor Straits, it explores how HABs generate explanations not only in scientific terms, but in the lived experiences of those navigating environmental breakdown. In doing so, it highlights problems of sensing, narrating, and surviving environmental disturbance shaped by multispecies entanglements and histories of colonialism and extractive capitalism.

2886 The Journal's Ghosts: Nonjournal Digital Publishing and the Politics of Adjacency

Start Date: 11/21/2025 4:15 PM **through** 11/21/2025 5:45 PM

Venue: Marriott **Room:** Studio 4

Type: Roundtable/Town Hall

Since the early 2010s, sections of the AAA have developed digital publications that feature short-form writing and, increasingly, more-than-textual or multimodal work. Arising in the context of broader trends toward user-generated online content, these publications are sometimes referred to as "journal-adjacent," recognizing both their affinity to and distinction from the peer-reviewed journals that scholarly societies have traditionally used to promote the exchange of knowledge. Inspired by theoretical accounts of adjacency as a space of problems inviting formal innovation, this roundtable takes stock of what is happening in society publishing beyond the journal, at a moment when the journal is being rendered spectral by a constellation of forces including scientific reform movements, commercial dynamics, and changing practices of media consumption.

Structured as a conversation between anthropologists currently or previously engaged in managing nonjournal publications and content channels, this roundtable asks: What are the goals of these publications, as they relate to the wider aims of the sections that sponsor them? Who contributes to them, and what audiences do they address? What infrastructures and labor arrangements are needed to produce, share, find, and preserve these publications? To what extent does this sort of publishing "count," whether in academic systems of reward and recognition or other registers of value? And what other forms could these publications take, as the landscape of anthropological communication continues to evolve at the AAA and beyond? While grounding our discussion in specific, local experiments, this roundtable seeks to explore the shared properties of these emergent media and the claims they stake to both credibility and relevance.

2699 Getting the Ghost on the Page: Writing about Spectral Encounters.

Start Date: 11/21/2025 4:15 PM **through** 11/21/2025 5:45 PM

Venue: Marriott **Room:** Studio 6

Type: Oral Presentation Session

Ghosts are hard to accept. They lament or accuse, both of which are difficult to bear. While the unquiet dead can be demanding, a greater challenge lies in taking them seriously in a public way, relating disturbing, uncertain personal encounters to potentially incredulous audiences.

Ghosts manifest in various ways for each panelist in this proposal, but we all greet them via writing. We commonly attend to the distinctive circumstances under which specters have appeared to us, while we also chronicle the powerful secular forces that strive to squelch their presences, countervailing against their entreaties for our attention. We emphasize the experiential immediacy and emotional power of personal hauntings, in contrast to metaphorical renditions of ghosts as social figures in "hauntology" (Derrida, Gordon). Our specters do more than 'unsettle'; they seize hold of the living in emotionally visceral and vivid ways. We narrate various direct engagements between spirits and those whom they haunt, the fears and sorrows that these generate, and our subsequent obligations to the departed-to convey these encounters, and yet preserve or respect their ephemerality. Whether by channeling or conjuring, we contend with the powerful moral forces of their manifestations-seeking solace or to alleviate remorse-fearful of the harms they might cause if left ignored or unacknowledged.

Gary Moody will open our session with a spirit medium performance. He will play and explain an instrument called a Monochord, which allows spiritualists to open a multi-sensory communicative channel between souls of the living and spirits in the Afterlife.

John Hartigan will relate a series of personal encounters with ghosts who haunt his department, unquiet spirits that speak both of their tragic fates but also of this perilous moment for anthropology.

Victoria Massie will speak of how she is haunted by the sudden death of her mother from the accumulated stresses of racism. Massie sees in her death the telltale signs of the "afterlife of slavery," which channel historical traumas through multiple generations. But this haunting is quite personal for her as well.

Clint Westman will relate stories from his encounters with the dead during his fieldwork among the Cree in northern Alberta. In funerary rituals, he was prompted to eat, smoke and dance with the dead, his own as well as tribal members.

Jennifer Sime uses ethnographic poetry to bear witness to her encounters with Maruxa and Coralia Fandiño Ricart, sisters in an anarcho-syndicalist family who were brutalized by the Falange during the Spanish Civil War. Their specters appear to her now in fleeting glimpse across her pages as she strives to channel their laments.

Veronica Solis Mora tells stories of nahuales-other-than-human spirits and shapeshifters, beings who haunt the Monarch Biosphere Butterfly Reserves She narrates how these indigenous manifestations resurge from deep time.

Presentation(s): Monochord spirit and sound healing demonstration – evoking spiritual specters in the academy

My auto-ethnographic training as a spirit medium places encounters with spirits center stage. I explore how mediums cultivate extraordinary sensory phenomena for wellbeing and how this can inform the field of transcultural psychiatry. I investigate not just the "fixed points" (people and behaviours), but the "sensations that are ignited in and flow" through spirit healing practices. These multi-sensory and emotional phenomena cross embodied space, people, spirits, unconscious forces, and the surrounding environments. However, verbal description does not capture the deeply felt experience of these spectres. They need to be re-created and animated in the academy. I recreate these atmospheres for academics, using a stringed spirit healing instrument called a Monochord. The Monochord creates harmonic overtones that transports people to another place by sounds, using "forces, flows, energies and atmospherics that conventional sociological approaches can find hard to grasp". Listeners can experience multi-sensory phenomena associated with spirit healing practices. I have also delivered Monochord healing experiences in a mental health unit, disability performance group, and for Emergency Department doctors and nurses.

My broader PhD thesis documents how Spiritualist mediums cultivate a new sensory paradigm that delivers emotional awareness and resilience. This sensory strength allows mediums to access a multi-sensory healing language that overcomes limitations of verbal language

Presenter(s): Gary Moody

The Last Cohort: Three Hauntings

My department has a few ghosts. This paper addresses three of them. The most pressing one is a grad who was killed in Mexico last summer. He haunts my dreams, preceded by a flood of images

from a place I don't recognize. Then his face appears, eyes shocked in horror and rage, and a terrible scene of violence unfolds. Some nights he is trailed by other ghosts of unquiet dead of the borderlands. But his pleading is distinct, and I struggle to understand. I believe he left something behind here, something unrecoverable, like his murdered body.

A different ghost haunts the creek that flows through campus and right past our building. She was raped and murdered on the wooded creekside ten years ago. I walk by that spot every workday. People no longer leave her flowers, but on occasion, after dark, I still encounter her. She grows fainter each passing year, and I wonder what impels her to linger. Is she rooted there by the violence that took her life or an unceasing yearning to be among the young on campus?

The third ghost is of a gorilla. His skeleton is displayed in a case outside our main office. The bullet the felled him left a small hole in his cranium. I assure myself that when it seems to rustle that it's just my imagination. Students sometimes ask one of my bio colleagues if our collections of bones are haunted. He tells them no, but I've come to disagree.

Presenter(s): John Hartigan

On Losing My Mother: Repurposing Generation, Re-membling Chronic Stress

In recent years, the afterlife of slavery has taken on a new life in public health studies of chronic stress through generation. For instance, epigenetic trauma theories are increasingly leading to ahistorical explanations of embodied historical stress. Similarly, maternal mortality rates increasingly use comparisons between first and second generation Black immigrant groups; between Black immigrant groups and Black American descendants of the formerly enslaved; and between Black Americans today and their ancestors who survived the Antebellum south. This paper asks what work is generation being made to do in the work of addressing the reproduction of racialized health inequalities. But most importantly, what work can generation be made to do differently for understanding the enduring legacy of racism without conceding a biological "fate"? Drawing on the sudden death of my own mother from the accumulation of stress in 2018, this paper deploys a black feminist poetics of absented presencing to reckon with losing my mother as a genealogical opportunity to re-organize attention toward the way racism is made to endure.

The living and the dead in Cree ritual practice

Cree people in northern Alberta continue to maintain relations with the dead through ritual practices invoking both new forms of Christianity and pre-existing cultural traditions. A key ritual, the wihkohtowin feasting complex, engages directly with spiritual entities including the dead, embodying them through movement (dance), eating, drinking, smoking, singing, drumming, and praying. There is also the question of to which extent the ceremony has been directed at the dead (which seems to be more the case since at least the mid-20th century) versus animals and other entities (who may have been dominant previously), and of the theoretical or mythological point where the souls of ancestors and the spirits of animals might become somewhat indistinguishable.

Echoes of the system of relations upheld in the wihkohtowin can be found in contemporary Cree funerary rituals where people continue to eat (and sometimes smoke) for and with the dead, keeping them company and lighting fires in their honour. Here again a collective feast or meal becomes in part a sacrifice for the deceased. I have published on the wihkohtowin and the Cree funerary wake in the past, but I want to return to this material here given its relevance to the theme of "Ghosts." During my fieldwork I was asked to eat, smoke, and dance for the dead, and to think on my dead loved ones while doing so. Such experiences, among others, caused me to reflect on the existence and scholarly implications of real ghosts.

Spectral Encounters: Ethnographic Poetry and the Work of Memory in Spain

The work of memory concerning the Franco dictatorship continues to unsettle the social landscape in Spain. The primary focus of much of this work, and of recent anthropological scholarship in Spain, has been on the exhumations of mass graves and on the surge in support for far-right political parties nostalgic for the dictatorship. But what form does the work of memory take when the Franco regime's specters are glimpsed, not through material traces of the regime or neofascist political movements, but through more ephemeral encounters with the past: stories, memories, and rumors? In this presentation, I read and comment on several of my own poems which center upon my interlocutors' memories of two sisters in post-civil war Santiago de Compostela who were brutalized by the Falange and shunned for their family's politics. The sisters, who appeared on the streets of Santiago in extravagant clothing and makeup, were considered to have been driven mad. They were, and are, a spectral reminder of both the brutality of the Franco regime and of the possibility of living, otherwise. In my poems and commentary, I argue that ethnographic poetry showcases the complexities of ethnographic inquiry on memory, its transparencies and opacities, that often escape the analytic focus of traditional forms of academic writing. Ethnographic poetry, in centering the fleeting image, the palpable detail, and the materiality of language, makes possible encounters with the specters that haunt us.

Presenter(s): Jennifer Sime

"Nahuales"

This presentation conjures beings, voices, and forces from realms and other-than-human. The inspiration for these stories comes from different places and times. Understanding other realms of nahuales (spirits/shapeshifters) is a pre-colonial oral legacy of Nahua (Aztec) culture that remains, which yielded attention to the felt, heard, and unseen, a practice of sensing transcribed in oral stories. The stories in this presentation found inspiration in different latitudes; some in my region of interest in the Monarch Biosphere Butterfly Reserve, and others found inspiration from the frequent manifestation of nahuales in the range I call home: multiple corners in two countries, where spirits oscillate, cohabitating with different life forms.

The voices and shapeshifters in these stories transform everyday spaces, emerging as testimonies of different times. Words become the tool for spirits to decenter human voices and versions of

events, allowing ghosts or spirits to wander between different dimensions. The stories explore and transpose spaces and beings within the earthly realm, the tlaltipac (León Portilla, López Austin, and Maffie), disrupting the everyday dimension of familiar tridimensional space.

The narratives reveal spirits or nahuales, which can sometimes violently vanish in human time through forms of consumption or, at times, resurge from deep time as awakening spirits. These stories challenge and expand our human perception of the world.

2502 (De)composing Durability

Start Date: 11/21/2025 4:15 PM **through** 11/21/2025 5:45 PM

Venue: Marriott **Room:** Studio 7

Type: Oral Presentation Session

When does durability actually entail decomposition? When does decomposing something—a material, relation, social structure—make it more durable? This panel decomposes the durability of the very dichotomy of durability-decomposition, stability-instability, and related pairings. We explore a diverse range of ethnographic cases in which people, on the one hand, work to stabilize social/material arrangements that may be unstable—from bodies to capitalism. Or, in other contexts, how people, environments, or objects destabilize or deteriorate those processes, structures, or events that seem durable. Through such practices people create the conditions for unexpected, unsettled forms of maintenance, emergence, endurance, and decay. For instance, renewable fuels and materials, often examples of "green capitalism" despite the hopes of sustainability attached to them, offer a path for extractivist modes of production to remain durable even as such modes of production destroy the planet. In a different realm, the social reproduction of the nuclear family in places like the United States decomposes other forms of kin relations even as its own durability is questioned, made shaky and unsustainable. Other papers in this panel also explore the stabilization of neurodegeneration in animal research subjects; techno-futures around cow milk production, such as automated milking systems, that both unsettle and reentrench dairying inherited from the Holocene and from European histories of peasantry; and toxic lead as an inheritance integral to collective composition at the same time it decomposes the biological body.

In this panel, we therefore ask: How are durability and stability variably related to notions of progress and social decay? Who and what does durability and/or decomposition benefit? To what extent do infrastructures and affects rely on durability and/or instability? Are stability and dissolution states or endpoints, and in what ways are they similar or different states or endpoints? How does temporality factor into anthropological understandings of durability and instability? How are temporal lines drawn around phenomena to designate them as changing or unchanging? And what does attention to stability, or efforts to stabilize, as a motivating force in social (re)production help us understand about society—and planetary—scale shifts? We draw on generative retoolings of

scholarship around homeostasis and growth (Murphy 2017, Solomon 2016), shrinkage and loss (Bessire 2021, Parreñas 2018, Brynne Voyles 2021), shifting matter and chemical conversions (Zee 2022, Agard-Jones 2014), and resilience and emergence (Evans & Reid 2014, Cooper 2007) to ultimately theorize durability, decomposition, and their relationship with one another.

Presentation(s): Enduring Co(w)-Evolution

What kind of human-cow lifeways are possible under contemporary circumstances, knowing that dairying inherited from the Holocene and from European histories of peasantry and self-sufficiency are actively being altered by techno-futures of the Anthropocene in the form of Automated Milking Systems and growth in new food technology seen in local supermarkets all over the world where oat milk is as normal as cow's milk? This paper tracks three contemporary forms of life with cows in Germany and Austria. The paper shows that shared lives between cows and people at these sites give perspective to the question of how temporality over a long *durée* factors into anthropological understandings of durability and instability.

Presenter(s): Juno Parrenas

Life's Durability through Lead in Peru's Metallurgic Capital

The city of La Oroya is laden with lead. Located in Peru's central Andes, heavy metals from the city's polymetallic smelter pervade its ecological surrounds and permeate the bodies of its 33,000 residents. The gravity of the city's toxicity has made it an emblematic site for environmental advocacy to rally against the chemical violence of Peru's neoliberal extractive economy. However, to the chagrin of environmental NGOs, many residents of La Oroya refuse, undermine, or ignore the advocacy done in their names. NGOs diagnosed this resistance to resistance as a "problem of culture," one of economic dependency and false consciousness, but in this paper, I analyze it as a strategy of temporal durability, paradoxically, through corporal de/composition. When asked how they endure the toxicity of their city, some Oroyans respond that their bodies have adapted, that the pollution becomes "a part of you," as a familial "inheritance," or as one woman said, "If you don't have lead, you are not an Oroyan." What does it mean then for lead to be an inheritance integral to collective composition while it simultaneously decomposes the biological body through its toxic presence? In the aftermath of preceding toxic eras of colonial and hacienda extractive violence, this paper argues that "adaption" to chemical toxicities composed hitherto absent arrangements of collective care, sovereignty, and possibility, and their temporal durability, as they became elusive in the neoextractive present.

Presenter(s): Stefanie Graeter

Durable Bioplastic, Durable Petro-Extractivism: The Paradoxes of Sugarcane-based Plastic

Amid fossil-fueled climate change, scientists and engineers have for decades worked to devise solutions to CO2 emissions, fossil energy use, and the warming planet. These include plant-based replacements for a wide range of currently petro-based products and materials, from fuels to plastics to synthetic fabrics, industrial chemicals, and even cosmetics. Drawing on over ten years of ethnographic research with Brazilian scientists, this paper examines a curious paradox of one such plant-based solution: the non-biodegradability of sugarcane-based bioplastic. Considering the durability of (bio)plastic alongside the durability of petro-extractivist structures, the paper argues that sugarcane bioplastics often enable continued (bio)economic expansion and lead to the consolidation of the role of major oil companies within sustainability efforts. To do so, the paper undergoes a heuristical experiment of theorizing bioplasticity as a paradoxical mash-up of the concepts of plasticity (the capacity to change form while maintaining substance/essence) and bio-based substitution (the practice of substituting, or changing substance to maintain form). Analyzing how such opposing substance/form dynamics contradictorily come together in the object of bioplastic, the article makes a broader case for how green technologies and decarbonization efforts often replicate the problems they promise to solve.

Presenter(s): Katie Ulrich

Decomposing Progress: Scientific Experimentation and The Green Monkeys of St. Kitts

The green monkeys (*Chlorocebus Sabaeus*) were introduced to the island of St. Kitts as a by-product of trans-Atlantic slave trade. I conducted 13 months of ethnographic research on St. Kitts at sites of human-monkey encounters, including scientific and behavioral facilities that use animal subjects. Neurodegeneration research is increasingly relying on purposefully inducing analogs of diseases of aging, such as Parkinson's, Alzheimer's and related dementias, in primates. Scientists selectively damage or decompose parts of monkeys' brains. Disabling monkeys increases their scientific utility, and their monetary value. Neuroscience research on animals has brought valuable translational insights into the function and pathologies of the human brain (Royo 2021, Yao 2021). Neurodegeneration, a form of physiological instability and deterioration, is being rendered an increasingly durable state, as scientists endeavor to stabilize it as a condition reproducible in animal research subjects. Novel methods of disabling monkeys are seen by scientists as forms of progress. Definitions of disability and utility are re-framed by the infrastructures and affects they rely upon. This paper touches on the culling of human elders during the COVID-19 pandemic (Cohen 2020); the culling of wild monkeys considered invasive pests on St. Kitts (Gallagher 2020); and the valuation of scientifically disabled green monkeys as paradoxically super-abled research subjects.

7273 Responding to Urgent Threats to Democracy, especially Universities: Learning from Haiti

Start Date: 11/21/2025 4:15 PM **through** 11/21/2025 5:45 PM

Venue: Marriott **Room:** Studio 8

Type: Conversation/Debate

As is widely and deeply felt, and as forecasted by Project 2025, the Trump administration is undoing the core of what U.S. Americans have come to understand as democratic institutions. In addition to targeting specific "others" that have been dehumanized, such as trans people, immigrants, and activists who defend Palestine, the administration is also taking aim at universities, which have had a fraught and contradictory relationship with democracy and social change. The administration's deep cuts to research and closing the Department of Education take aim at a particular vision of universities as incubators of social change, among the last bastions of free thought, and the hub of what has been vilified as "wokeness." As university communities struggle to respond to these existential threats, what Mwenda Ntarangwi (2010) called the "reversed gaze" is useful, particularly now, enabling a view of US politics from sites long framed as the objects and "others" of intervention and analysis.

An element of an anthropological imagination – seeing the interconnections of particular struggles for justice – is that we in the Imperial center learn from those who have been subjected to our policies. Often used as a laboratory, a "canary in the coal mine," Haiti – and Haitian scholar/activists – offers lessons for navigating authoritarianism and neoliberal racial capitalism for this particular moment. This special Speaking Justice to Power event offers a dialogue with a recently published book, Darlène Dubuisson's *Reclaiming Haiti's Futures*. Dubuisson's ethnography explores how returned Haitian intellectuals sought to reimagine Haiti, even as Haiti was often imagined as a site without any future.

Applying these lessons, this event will also ask how learning from Haiti might inform APLA's work on academic freedom and reimagining the university. APLA has organized a task force with three primary goals: providing information and resources that will empower people to protect themselves and others; documenting attacks; and, eventually we hope, providing active and individualized mentoring and advising.

8901 Art as Offering in a Haunted World

Start Date: 11/21/2025 4:15 PM **through** 11/21/2025 5:45 PM

Venue: Sheraton **Room:** Armstrong BR (8th fl) (access via elevator only)

Type: Late-Breaking Roundtable/Town Hall

On May 26, 2025, in Public Anthropology, Thea Abu El-Haj's "When Words Fail: Painting in a Time of Genocide," appeared in the open access "Forum: Confronting the Genocide of Palestinians and Refusing Repression." In the piece, Thea shares an intimate window into her "felt sense of the terror" and how she paints abstract images because she must, so that she can feel and "move out of the numbing well of despair" (149). Thea wants her art to serve as a connector, to help us experience "deep human suffering", so that we can "imagine, create, and act" (150).

As dancers, film makers, performance artists, visual artists, poets, and photographers, we take up Thea's offering as provocation. We will share how our art moves us through the political barrage of repeated iterations of genocide, flagrant greed, and man-made traumas on one another and our more-than-human worlds. We cannot digest this pain and suffering through our individual and collective bodies; instead, we turn to our art.

Alongside Thea, we will explore her question: "Why paint now?" (149). Why make art now? Together, we will also engage the following inquiries:

- How does your work as an artist and anthropologist nurture your offerings to our fractured world?
- How do ghosts, spirits, hauntings, and the spectral show up in your work as an artist? As an anthropologist? As an artist anthropologist?
- How does your art practice (and/or projects) respond to urgency or urgencies in this moment? And, how does your art rework, resist, or refigure urgency?

Thea ends "When Words Fail" with an offering: photographs of two black and white abstract paintings she made while witnessing the current genocide perpetuated against Palestinians. She asks the viewer: "Look at the work and let yourself feel what you feel" (150).

How does your art feel? How does it move you? How does it move humanity? How does it move our world?

4362 Haunting Atmospheres

Start Date: 11/21/2025 4:15 PM through 11/21/2025 5:45 PM

Venue: Sheraton **Room:** Edgewood AB (4th fl)

Type: Oral Presentation Session

Haunting vividly conjures the past-as-present. For minoritarian subjects, the afterlives of structural violence can assume multiple forms. This panel both acknowledges and disorients our attachment to the human implicit in the figure of the ghost, the past/present binary it embodies, and the inner/outer, subject/world oppositions that ground our orthodox conceptions of subjectivity. We can be haunted equally by "vibrations," (Jayna Brown 2021) "toxicities," (Chen 2023), climate, "weather," (Sharpe 2016) environment, and "atmosphere": lingering affective histories that permeate the air, the landscape, our skin, our unconscious.

These histories may envelop us from above, and they may emanate from landscapes and objects that constitute our everyday "affective infrastructures." Objects, spaces, light, colors, sounds, and textures can haunt through their sensorial properties. Humans, too, can become ornamental objects that exude "atmospheres" in cinema, performance, and everyday life. Lethal particles, drones, and landmines can wreak destruction and haunt through the spread of toxic chemicals that never die. Affective/chemical atmospheres can pervade everyday life invisibly, fostering the "weathering" that is "slow death."

Our panel addresses haunting atmospheres that pervade human/more-than-human lives through affective geographies, environmental devastation, settler colonial histories, and geopolitical domination. Integrating Anthropology, critical race and feminist theory, environmental humanities, sound studies and performance studies, we theorize the invisible yet profoundly life-determining operations of atmospheric violence through historically, culturally specific, yet related experiences of BIPOC (Black and Asian/American) women. In the face of state terror as "frequencies" of anti-Blackness (Smith), atmospheric violence (Kondo, Aijaz, Stanley), "hot noise" (Wang), "subhuman" labor (Bowles), "haunting being" (Beras), and "colonial afterlives" (Jones), how do we intervene? Activist organizing, critical scholarship, performance, the arts, community engagement, alternative practices of listening as "ghost archive", and the ritual summoning of ancestors who mobilize communities toward the future, offer strategies to "change the air."

Presentation(s): Haunting As Atmospheric Violence: Power/Knowledge, Sexual/Racial Violence, and Asian/American Women

Haunting can exceed the human form, becoming "atmospheric violence" that envelops and permeates landscapes. Like climate and weather (Sharpe 2016), these atmospheres of violence (Aijaz, 2024, Stanley 2021), imbue objects and landscapes with power-laden affects. Sexual and racial predation/ harassment have long created "chilly climates" for BIPOC women. This essay spotlights the Orientalist fetishism directed against Asian/American women and its imbrications in Orientalist geopolitics and the Cold War imperialism of U.S. East Asian Studies and by extension, Anthropology. Integrating memory, interviews with Asian American women, Asian American cultural production, and an interdisciplinary theoretical apparatus, this work reconfigures the human ghost as atmospheric violence. Histories haunt the present. Consider the rise in anti-Asian assaults in the wake of the Covid-19 pandemic, including spectacular acts such as the 2021 shooting of six Asian/American women in Atlanta. These events and the quotidian violence of slow death recreate spectral atmospheres imbued with power-laden histories: Orientalist geopolitics, misogyny, inter-imperial rivalries, and relations of war, invasion, occupation, colonization, that configure Asia and Asians as economic/ political threats to U.S. empire. What are the theoretical, political, epistemological, and phenomenological implications of our continued haunting by atmospheric violence? How do we mobilize to change the air?

Presenter(s): Dorinne Kondo

Atmospheric Hauntings: Black Women and Violence in the Atlantic

Gail Lewis, in writing about police terror against Black women in Britain, uses the concept of "presence" to think through the temporal dimensions of the presence/absence of Black women in the discourse of state violence.[1] Indeed policing, as a form of state terror, operates on multiple frequencies that are both gendered and raced. This paper considers the atmospheric frequencies of anti-black terror in the Americas as diverse wavelengths that operate according to logics of race, gender and sexuality. Examining Black women's experiences with this terror in Brazil, I explore how the conceptual frame of frequency can provide a methodological template for understanding how gendered and racialized state terror is atmospheric and therefore haunting. I argue that considering anti-black terror in this way provides a map for understanding the vibrations, toxicities, climate and weather of lingering affective stories of violence and survival for Black women in the Atlantic. [1] Specifically, Lewis uses performance theory to think about the temporal in relationship to spectatorship. She writes, "Presence in this frame is also a temporal concept in that the spectator inhabits a dual temporality in the moment of consumption of the performance: the fictional time in the narrative, and the social here-and-now of the performance." Lewis, "Question of Presence," 3.

Presenter(s): Christen Smith

Sankofa, Tuko Pamoja, Yor yor!- Atmospheric conditions of engagement in and through performance

Blackstorytelling is one word. In this African American tradition derived from the practices of African griots, artists interpret life histories through word, song, and dance (Goss, 1989). Distinct from western storytelling and folkloric traditions, Blackstorytellers are not actors; rather, they

channel the very spirit of those they study. Saidiya Hartman (2024) describes such study in the case of archival research as living with her materials and living in the company of her historical Black women interlocutors. In this work, researchers and artists invite such haunting, create the atmospheric conditions to receive from the spirit world, and give themselves over to it. As an extension of African history sharing praxis (vis-à-vis griots) in the former and Black feminist methodology (leaning on ancestral wisdom) in the later, the hauntings in these projects is not separate from longstanding traditions around African ritual practice which engage performance as both methodology and pedagogy for community-based decision making. This paper examines performance-based atmospheres for non-temporal community engagement and presents two cases of contemporary uses of community performance for social change in Liberia and Tanzania, peeling back the layers of colonial afterlives to reveal the enduring spirit of ritual performance which enlivens participatory, collective engagement which channels the past into the an active performance present to set in motion the future.

Presenter(s): Jasmine Blanks Jones

Noise, Silence, and the Ghost Archives in Taiwanese Ears

Everyday life in contemporary Taiwan pulses with cacophony: hawkers and mopeds bustle in the morning markets, migrant laborers' hubbub suffuses the noontime train stations, and karaoke song fragments bring on the night. Sound scholars on Sinophone Asia typically explain the prevalence of such boisterous sociality through the cultural trope of "hot noise" (renao), which sensorially registers human entanglements—with the spirits (Hatfield 2010; Weller 2023) and with each other (Hsieh 2022). In this paper, instead of framing the hot noise as an iconically Taiwanese sonic aesthetic, I analyze it as a sensorial séance for silenced pasts and unspeakable futures. I situate ethnographic scenes (of the market, the train station, and the karaoke suite) in a transpacific framework that understands Taiwan as a tenuous multicultural democracy haunted by multiple authoritarian regimes, overlapping and ongoing forms of colonization, and the lingering Cold War designation of the U.S. as an "empire of liberty" (Yoneyama 2016). I also trace my interlocutors' ways of listening, through which they unfold fractured imaginations of other futures and alternative histories, mediated by politics of class, race, and gender. In the face of Taiwan's profoundly uncertain present, I show how listening to hot noise as atmosphere (Peterson 2021) renders everyday cacophony as what Julietta Singh calls "the ghost archive" (2018): a longing for what has been repeatedly left out, that refuses to be exorcised.

Presenter(s): Yun Emily Wang

THE HAUNTED AS A HAUNTING BEING: THE IMAGINARY OF HAITIANS AS OTHER-THAN-HUMAN

Across the Dominican Republic, Haitian descendant people are situated and imagined as other-than-human, which drives me to examine how antiblackness and anti-Haitianism are articulated through colloquial metaphors that are taken at face value and often dismissed as linguistic and cultural idiosyncrasies of Dominican society. In this paper, I focus on discourse that positions the Black Haitian as an exceptional and incomprehensible subject, therefore transformed into an

object that metamorphosizes across context. This malleability informs imaginaries of the Haitian as a haunting being that at the same time, is haunted by antiblack violence. In Christina Sharpe's words, "...Black people, become the carriers of terror, terror's embodiment, and not the primary objects of terror's multiple enactments" (2016:15). To that end, I draw on the work of scholars whose theorization around the category of the Human and articulations of the black subject/object provides a point of departure for framing and comprehending what unfolds in the Dominican context, wherein racist tropes and stereotypes foment the notion of Haitian incompatibility with Dominican culture. As a reversal of analysis, I attend to expressed desires and uses of mimicry by people of Haitian descent that serve as counteractions against forces aimed at their dehumanization. This paper is contextualized through three particular examples of discourse narrative related to interactions that took place within and outside of the bat

Presenter(s): Karina Beras

"Ghostly" Black Bodies: Aluminum Pans, Antiblackness, and Porter Work in Ghana

This paper considers how the material attributes of aluminum pans suture antiblackness to women's bodies in Accra, Ghana. On any given day, women who work as head porters use aluminum pans to transport goods, carry water, wash clothes, bathe children, cook meals, and keep perishable foods cool. Aluminum pans—often silver-grey, speckled white, or robin's egg blue—have a durability, affordability, and versatility that ensures their indispensability in daily life. In the 19th century discovery narratives of aluminum, the metal was described as "ghostly," to reference the ease with which chemists identified the element's presence and, the difficulty of isolating its pure form. Drawing on Sylvia Wynter's concept of cybernetics to theorize aluminum pans as a site of sociogenesis, this paper demonstrates how head loading labor is a subhuman /superhuman binary of infrastructure that makes visible, the interplay between modernity and survivance—destabilizing notions of the digital economy as a necessity of gig work.

8129 Against familiar ghosts: Political organizing and the defense of life under authoritarianism in El Salvador

Start Date: 11/21/2025 4:15 PM **through** 11/21/2025 5:45 PM

Venue: Sheraton **Room:** Estherwood (4th fl)

Type: Oral Presentation Session

Growing authoritarian governance (from Trump to Bukele to Milei) is spreading across the hemisphere endangering life in all its forms but especially the most marginalized and vulnerable communities in often classed, gendered, and racialized ways. The president of El Salvador has described himself as the "world's coolest dictator." Bukele's self-description reveals his marketing-driven façade, which trivializes human rights violations, lack of due process, and the environmental extractivism on which his authoritarian regime is grounded. For the most vulnerable sectors of

Salvadoran society, the shifts in the political landscape do not represent progress, but the continuation of deeply rooted struggles against state violence, racial liberalism, economic exclusion, and the silencing of dissent. Echoing the conference theme of "Ghosts," this panel examines the resurgence of El Salvador's familiar authoritarian ghosts, exploring how genealogies of resistance shape contemporary political subjectivities and the struggles of social movements against intensified neoliberalism and punitive security models. This panel centers the insights of diverse activists, ranging from liberal, pro-democracy activists in 2011 and long-time rural organizers in sexual education programs to gang family members and family activists for incarcerated people. We ask: how do social movements and grassroots organizing collectively defend human and non-human life under authoritarianism? Drawing on longitudinal ethnographic fieldwork in El Salvador, the panelists offer genealogies of resistance along the consolidation of authoritarianism in El Salvador, calling for the urgency to center on the political and grassroots organizing that defends life against growing authoritarianism.

Presentation(s): Indignant Liberalism: the throughline from democracy activism to dictatorship

In this paper I interrogate pro-democracy activism that preceded the ascendance of Nayib Bukele to the presidency of El Salvador. In the early 2010s, a group of young, urban, largely middle-class protestors just coming of political age began to march against government corruption.

Representing ideologies from left to libertarian to neoliberal, the demands of these "Salvadoran Indignados" nonetheless arose from a classic liberal orientation. They saw their movement as calling for equality for all, as defending life and demanding justice through the integrity of the courts. Most of them did not recognize the "racial liberalism," in Jamaican philosopher Charles Mills' terms, that haunted their country's history from colonial oppression to independence and beyond—especially as notions of racial difference in El Salvador have been buried in mestizaje and massacres. While acknowledging the sincerity of these activists, I draw on their experience to examine how their calls for a return to the liberal ideals Salvadoran leaders claimed from the earliest days of independence, and which were reiterated in the 1992 peace accords, could not overcome the growing disappointment with traditional forms of politics. That frustration led to the election of an authoritarian populist—"the world's coolest dictator"—and the conversion El Salvador into what some global critics now call a gulag, with the highest incarceration rate in the world.

Presenter(s): Ellen Moodie

Women's Politics of Solidarity in El Salvador: Patriarchy, Intersectional Justice, and Peacemaking

This paper explores women's politics of solidarity within the context of El Salvador's war on gangs. This research is based on longitudinal ethnographic fieldwork and oral histories with women relatives of men in gangs during the post-1992 Peace Accords era. This period is characterized by social conflict between the Salvadoran state and gangs alongside the implementation of U.S.-inspired neoliberal punitive security policies. Through these policies, the Salvadoran state has racialized and criminalized gangs as a "plague" and internal enemy/terrorist organization that must be incarcerated or eradicated to attain peace, all while state actors blame women for their relatives' gang affiliation. My practice of activist research uniquely positioned me to understand how Salvadoran women's socially constituted and gendered "duties" of care are being challenged, reaffirmed, and transformed under the neoliberal punitive security policies. I examine how women interlocutors make sense of their positionality as relatives of men in gangs. From this positionality, women interlocutors challenge and support their relatives' peacemaking practices that trouble the state's punitive approach to peace. I argue that women's politics of solidarity reveal how patriarchal imaginaries often shape notions of justice in peacemaking efforts across different scales. Salvadoran women's politics of solidarity, instead, urge us to envision an intersectional justice approach to building a life-giving peace.

"Las Rejas No Callarán la Verdad": Family Organizing, Social Reproduction of Life, and Justice Reimagining under El Salvador's Carceral State

El Salvador's carceral project, which has arrested over 81,000 people without access to due process under a war on gangs, has become central to Nayib Bukele's authoritarian politics. Often erased in this global narrative is the rise of movements of families of the incarcerated, who are organizing to demand a space where "Las Rejas No Callarán la Verdad" (Bars Will Not Silence the Truth). This paper examines family organizing against Nayib Bukele's carceral project. Drawing inspiration from Susana Draper's move to articulate two feminist traditions for the abolition of the prison-industrial complex in the U.S. and against the crisis of social reproduction in Latin America, this paper considers a movement of families of incarcerated people at the intersection of these two feminist traditions. I consider how families of incarcerated people have become unevenly instrumentalized by El Salvador's carceral state in sustaining the lives of inmates and how they reimagine forms of justice in defending life in prisons under El Salvador's carceral state.

Aquí todos somos hijos de campesinos: Sexual Politics and Rural Activism in El Salvador

This paper draws from an oral history documenting 25 years of a rural, grassroots sexual education project in Santa Marta, Cabañas. The village is a politically active settlement founded by former wartime refugees, and at the time of my research, it had become the target of the Bukele regime

through military blockades and the arrests of prominent environmental activists. As I worked, two questions began to emerge— how did a project foregrounding sex and gender take root while still in the throes of postwar re/construction? And why were community members willing to devote so much time to sharing their memories of this project now, under such an urgent present? My field work begins to address these questions by revealing how community defense in the postwar, and, now, under authoritarianism, continues to be predicated on the protection of a collective subjectivity that encompasses both human and nonhuman bodies. The sexual politics in this small but emblematic community demonstrate how local activism draws from the throughline between mind, body and land, evincing connections between work as dispersed as anti mining activism and women's empowerment circles. While Santa Marta has historically retooled what counts as community defense, issues such as queer rights require that lines be creatively redrawn to demonstrate how, and when, something can become part of the collective body politic, and thus, worthy of attention.

7012 Shifting Ground: Politics of Eroding, Crumbling, Collapsing, and Burying - Part 2

Start Date: 11/21/2025 4:15 PM **through** 11/21/2025 5:45 PM

Venue: Sheraton **Room:** Gallier AB(4th fl)

Type: Oral Presentation Session

This panel approaches the ways that we might examine the concept of erosion, as both a material process and powerful metaphor for the Anthropocene. Erosion often arises urgently as a problem in places where the land-water interface itself is increasingly blurred and shifting—for example, built shorelines, rivers, wetlands, streams, canals, and other "muddy margins" (McLean 2011)—but just as critically in ecologies of forest, dirt, sand, and dust, where movement might be intensified by the progressive loss, rather than addition, of water. Processes like erosion are variously parsed as natural and unnatural, "problematiz[ing] modernist divides between nature and culture" (Vaughn 2021: 851). This panel considers the temporal and environmental politics of eroding, crumbling, collapsing, burying, and other forms of 'breaking down', asking: Through what forms of knowledge and expertise do people construct the problem of erosion and other land movement? What kinds of politics and practices does erosion bring about? Through what temporalities do these processes unfold, and what does it mean to think with these forms of temporality? At what material, temporal, and political scales might we consider erosion to be operating? How is repair envisioned within such multi-scalar temporalities?

We are interested additionally in the relationship between these material processes and broader ideas of breakdown. 'Crumbling' and/or 'eroding' infrastructures, landscapes, structures, materials, and more are often written alongside other phrases such as collapsing, burying, or breaking. What then becomes of these terms, especially in their various spatio-temporal registers? How is

crumbling related to accumulation—as antonym? as effect? We encourage greater specificity around the language of environmental 'breakdown', recognizing that crumbling and erosion do not only signify ecological loss, but are also a question of how and where material reemerges. What kinds of political imaginaries do they foreclose, and what alternatives might they open?

Presentation(s): Between Geomorphology and Speleology: Exploring the Material and Semiotic Grounds in Modelling Efforts in Yucatán, Mexico

The [i]Yucatec Karst Aquifer System[/i] (197,600 square km) is Mexico's largest aquifer, holding a third of all national groundwater. Thousands of sinkholes, caves, underground currents, and fractures define this Karstic landscape, an extraordinary system in its porosity and dissolubility. Amid the recent agroindustrial growth in the region, the aquifer has become a highly contested political space whose volume, shape, boundaries, and structure are being negotiated by environmental scientists and Indigenous communities in Yucatán. Based on 18 months of fieldwork, this paper explores how geomorphologists and speleologists make sense of the shifting subterranean boundaries between land and water. Through closely examining scientific practices, this paper considers how the production of scientific claims about Karstic dissolution becomes critical in negotiating the limits of the state. By comparing geomorphological and speleological visualizations of land, this paper analyzes how different models of the Karstic landscape produce different views of territorial sovereignty and Indigeneity. Through the analysis of scientific discourses and practices, this ethnographic exploration of Karstic science interrogates the differences between a geomorphological or a speleological understanding of land erosion and accretion, paying particular attention to how Karstic erosion and accretion unsettle traditional understandings of environmental harm in the Yucatec context.

Presenter(s): Pablo Aguilera Del Castillo

Temporalities of Genetic Erosion

The term genetic erosion dates back to the 1960s, coined by FAO to "describe a dramatic loss of 'genetic resources'" (Khoury et al. 2021). Habitat loss, industrialization, and the replacement of local varieties with "improved" ones, combined with more extreme and unpredictable climates has culminated in an overwhelming anxiety about crop biodiversity loss. Collecting seeds for multinational ex situ conservation is posited as a way to "fix" or "mitigate" genetic erosion.

In the logic of the seed bank is a series of translations and transformations: of seeds into genes, genes into resources, and resources into security. Conventional plant breeding uses these collections of "primitive" landraces as fodder for the creation of "elite" cultivars. However, reducing seeds to germplasm and framing these genes as a resource begets a different type of erosion, as relationships, histories, and traditional knowledge are often disregarded. This paper examines these collateral erosions that occur as "genetic resources" are prioritized for salvation, focusing on the temporalities that permeate biodiversity conservation. Through the example of peanut collection, breeding, and saving, I ask: What sort of seed work and seed futures are motivated by the threat of genetic erosion? What happens when we prioritize seeds and crops in their genetic form? Who are they intended as resources for, and who is being impacted by the potential loss in the first place?

Presenter(s): Eva Steinberg

Dialectics of Erosion and Deposition: Recovery Across Temporal Scales in Post-Tsunami Japan

Among the many radical changes imposed by the 2011 Japan tsunami was a massive, time-compressed cycle of erosion and redeposition from the coast inland, which added an unmistakable sand layer to the local geological record. These sediments are crucial to paleotsunami researchers investigating the return period of similarly destructive events. Their analysis privileges rare areas where these and thousands of years of other sediments remained undisturbed, discarding the vast majority of soil samples due to their "stratigraphic unconformities." This paper approaches such disturbed record ethnographically, recognizing in it traces of ongoing recovery as envisioned and practiced by scientists, policymakers, and evacuees. It argues that – by drilling core samples, recycling village remains into defense infrastructures against future tsunamis, or transferring soil and plants to rebuild a familiar landscape in present-day relocated areas – all groups "disturbed" the stratigraphic record of disaster to write their own narratives of recovery. Drawing on fieldwork in Arahama, district of Sendai City, this paper examines the tsunami-driven dialectic of erosion and deposition as both a material process and an analytical device to understand the multiple temporalities of post-disaster recovery.

Presenter(s): Arianna Tae Cimarosti

Tsangy: On Protective Erosion in Central Madagascar

In January and February 2022, four back-to-back cyclones battered Madagascar. Storms Ana, Batsirai, Dumako, and Emnati flattened coastal cities like Mananjary. They also reached further south and inland than previous cyclones, leaving ruined homes and crops in their wake. In the southern-central region of Fianarantsoa, flooding was the storms' worst impact, when extreme

rainfall and unruly drainage inundated the region's fertile valleys. Drawing on ethnographic fieldwork in Fianarantsoa during and after the storms, this paper considers the sedimented effects of these floods: the tsangy, the sands and dirt carried by floods from hillsides to valley floors. Mimicking the fast-moving waters of the cyclone flood and the long, stilted attempts at recovery afterwards, I carry listeners through tsangy's displacements, effects, and potentials. I show how tsangy is feared for its ruinous burial of young rice, a staple food in the region – how it is collectively contended with as villagers shovel out their land and hopefully rescue their crops – and how it is ultimately transformed into sandbags that will hold down roofs when the next storm comes. As tsangy shifts from storm threat to storm savior, I consider how Malagasy communities live with cyclonic erosion by doubly recuperating the rice which floods bury and the tsangy which floods carry. I therefore reconfigure the cyclone flood from singular disaster to a more ambiguous deposit of both danger and security.

Presenter(s): Gabrielle Robbins

Making a Coast: Land Loss and the Geography of Crisis

In 2023, Louisiana's coastal planners released the fourth iteration of their master plan: a rolling fifty-year, \$50 billion proposal to slow the erosion and subsidence reshaping the Gulf Coast. But master plans are not simply the inevitable response of a technocratic state to environmental threat. Figuring land loss as a shared coastal crisis has required almost a century of disparate observations of eroding property lines, mobilization by communities and researchers, and the strategic maneuvers of oil and gas firms. This paper argues that these very processes of sensing, narrating, and defending against erosion have actively produced "the coast" as a coherent object, both of crisis and governance. As the coast takes shape, it crystallizes particular histories of the land while offering a container for imagining the future. I draw on fieldwork with coastal scientists and activists to trace the social and political forms that coalesce around both the loss of land and its apparent defense.

3458 Analyzing the Intangible in Tourism and Beyond: Metaphorical Hauntings and Sensorial Experiences of Intangible Cultural Heritage

Start Date: 11/21/2025 4:15 PM **through** 11/21/2025 5:45 PM

Venue: Sheraton **Room:** Grand Ballroom A-C (5th fl)

Type: Oral Presentation Session

The sensory experiences, performances, and emotions of tourism experiences, like ghosts, can seem ephemeral or fleeting, yet also similar to ghosts, their impacts on people continue into the future through memories and lived experiences. In the case of intangible cultural heritage that is featured in tourism or involved in large-scale temporary events, this ephemeral or fleeting nature can seem even more heightened in comparison to monumental tangible cultural heritage. However,

performing arts, oral traditions, handicrafts, cuisines and other forms of cultural knowledge are skills and lived experiences "that are embodied in people" (Logan 2007, 33). Moreover, participants serve not just as mediums or conduits (Kirshenblatt-Gimblett 2004). Just as ghosts are not merely passive, not without volition, neither are the performers and creators of heritage, which is both transmitted and transformed in response to changing social and physical contexts. Hence in a metaphorical sense, intangible heritage can be spiritual and spectral in nature, creating a sensation within and outside of oneself and, through engagement, individuals can transform the immaterial into a powerful commodity or medium of negotiation, contestation, and power. In addition, literal spirits, ghosts, and ancestors can also play a role in the touristic transformations of intangible heritage, expressing approval and disapproval of new tourism enterprises in a myriad of ways and influencing the transmission of this cultural knowledge.

This two-part panel investigates both the metaphorical and literal ghosts and spirits of tourism. This session, which is part 2 of the panel, focuses on the more metaphorical "ghosts" of tourism, and builds out from part 1's more literal focus on spiritual experiences and spectral presences of intangible heritage tourism production. Drawing on tourism-based studies in Turkey, Brazil, Bolivia, and the United States, this second panel investigates how the metaphorical "haunts" of tourism, such as unequal power dynamics and effects of colonialism, can be traced and challenged as well as the strategies communities and anthropologists use to make meaning from intangible cultural heritage and navigate issues related to representation, belonging, and displacement. Attention is given to the strategies various dominant and marginalized groups employ to construct and contest the multiple meanings associated with cultural heritage tourism. It also investigates approaches anthropologists can use to analyze the impacts of "ghostly" or fleeting experiences of tourism performances, sensory experiences, and emotions.

Presentation(s): Haunted Hospitality: Airbnb and the Spectral Economies of Displacement in Istanbul

This paper examines how Syrian refugee neighborhoods in Istanbul have become sites where culinary practices, oral traditions, domestic aesthetics, and everyday socialities are commodified for international tourists through short-term rentals and informal neighborhood tours. Tourists seek not only shelter but sensory and affective encounters with "authentic" refugee life: sharing meals, hearing migration stories, and experiencing the textures of everyday resilience. Refugee homes and communities thus become living exhibitions, staged yet precarious. The very conditions that make these encounters desirable – war, loss, marginalization – are rendered spectral, shaping the tourist experience without ever being fully seen. Drawing on ethnographic research with Syrian hosts and international guests, this paper explores how intangible heritage under displacement is not only performed but haunted: by forced migration, economic exclusion, and the asymmetries of global tourism. Refugees are not passive transmitters of culture but strategic actors negotiating a spectral economy where their histories and homes are made visible and invisible at once. Tracing the afterlives of these encounters, such as the lingering affects, transformed spaces, reconfigured relationships to heritage, this paper contributes to debates on how tourism produces, consumes, and unsettles the intangible, leaving behind more than just memories.

Presenter(s): Fulya Pinar

Economy of Aesthetics: Sensory Experience, Tourism Designs, and the Making of Meaning

Sensory experiences may seem like "ghosts." While the physical experience may disappear, the social meanings and varying impacts can linger on. In the context of tourism where efforts are made to perpetuate certain sensory experiences as part of the tourism experience and brand for extended periods of time, understanding the impacts of such experiences is important as they can result in feelings of exclusion and inclusion. Yet, analysis is complicated by the fact that various sensory experiences can carry multiple meanings given the audience. How can the associated multivariate and multivocal experiences be captured? This paper presents the economy of aesthetics as one analytical framework to help capture the multiple and varied meanings produced within and across various tourism spaces from the biophysical to dance performances to large-scale festivals (Ricke 2023). Through an analysis of the sensescape surrounding one of the largest Oktoberfests in the world in Blumenau, Brazil, it illustrates how these sensescapes are intertwined with the negotiation of ethnic-national identities and senses of belonging. While the economy of aesthetics and anthropological approaches can be useful for tourism design, this presentation also addresses its usefulness in pedagogical design and how to make such sensory "ghosts" and their meanings come alive through scaffolded ethnographic projects related to tourism.

Constructing the Babel do Novo Mundo: dissensus, recognition and the social politics of ethnic heritage in southern Brazil

Between December 2021 and October 2022, Ijuí, a small rural city in southern Brazil, received two major heritage titles: Ethnic Capital of Brazil and Ethnic Capital of the World. Rooted in a nostalgic

rendering of the city's multiethnic European colonization, these recognitions reflect an effort by municipal elites to project Ijuí as a model racial democracy. For many residents on the social and spatial margins, however, the titles signify the apex of commodification, exclusion, and corruption, evoking responses ranging from pride and opportunism to confusion and anger. Based on long-term ethnographic fieldwork, this paper utilizes anthropological frameworks that center semiotics and power (Nakassis 2012; Silverstein and Urban 1996) to trace how these heritage titles are strategically performed and reinterpreted in quotidian life. I focus on how different publics revoice these official designations to express critique, call attention to unfulfilled social obligations, and make competing claims to the conditions of belonging in Ijuí. Rather than a tool for heritage officials to erase specters of social dissensus, I show how these heritage titles provide semiotic infrastructures to articulate competing claims to the city.

"Too Soon for Tourism": Anti-Colonial Ghosts, a Heritage Archive, and a Decolonizing State

The early 21st century brought to Bolivia its first Indigenous president, a new constitution, and a profusion of laws that recognized individual music and dance expressions as intangible cultural heritage. As part of a larger book project titled *Heritage Fever* (co-authored with Henry Stobart), we question what motivated Bolivians into a heritage-making frenzy at this politically transformative moment. We pivot away from UNESCO-driven heritage debates to a different set of questions (what we call "heritage otherwise") and focus on how citizens used law to frame expressive culture and to engage their relatively new state. This paper details a La Paz Department heritage law for the *mohoseño* flute, a case which was notable for its decolonizing dimensions and its complex interplay between insurgent traditions and a belief in the emancipatory potential of law. This heritage law referenced "rights of identity" and represented one political tool among others in the region's *longue durée* anti-colonial campaigns. Heritage-making protagonists recognized the potential and lure of tourism--to support livelihoods in this remote area that is imagined to be favored with natural abundance--but also its dangers and the need for local control. In this heritage vision, they assembled an archive of Indigenous insurrectional heroes—ghosts spanning multiple centuries—who were etched into the landscape and activated through performance practices.

Presenter(s): Michelle Bigenho

A Haunted Festival: Multicultural Heritage Production and Native American Erasure at the World Village Festival

Since 2015, Boise's World Village Festival has celebrated Idaho's multicultural heritage through song, dance, and food at the footsteps of the State Capitol. Idaho is better known for its potatoes than its cultural diversity, and is sometimes associated with white nationalism. But it has always had a diverse mix of cultures, diversity that increased recently through explosive population growth

and active refugee resettlement. As a curated staging of intangible multicultural heritage, World Village Festival was created to ease the tensions of demographic change. And yet, this festival is haunted. In this paper, I focus on the festival's staging of "Idaho's Native American Heritage" and discuss the ways that it perpetuates representational erasure. Through the framework of heritage, the festival erases actual histories of removal, and replaces them with creations of the "American Imaginary" (Strong 2013). And through the production of alterity, the World Village Festival reveals itself to be a production of settler systems of cohesion that do not ultimately benefit Native peoples (Povinelli 2002). These frameworks, however, are subverted through actual Native performers using a kind of 'Trickster' activism.

Presenter(s): Kimberly Marshall

7409 The New Reproductive Order: a roundtable on feminist reproductive studies, Part Two

Start Date: 11/21/2025 4:15 PM **through** 11/21/2025 5:45 PM

Venue: Sheraton **Room:** Grand Ballroom D (5th fl)

Type: Roundtable/Town Hall

In 1995, Faye Ginsburg and Rayna Rapp published the landmark anthology *Conceiving the New World Order*, the first major volume to explore the global politics of reproduction from the point of view of both its marginalization within anthropology and related disciplines and its simultaneous centrality to both the social order and political economy. Ginsburg and Rapp's ambition to 'transform traditional anthropological analyses of reproduction and to clarify the importance of making reproduction central to social theory' has succeeded in many ways. Over the past 30 years, the rapid expansion of the anthropology of reproduction has been accompanied by the global spread of the reproductive justice movement, and a new centrality for reproductive politics on the world stage. Increasing concerns about reproduction and fertility now intersect with many of the most important political challenges of our era, including climate change, economic instability, the rise of authoritarian regimes, debate over immigration, battles over national borders, and marginalization of varied minority and LGBTQ+ communities. Part two of this roundtable revisits these themes in the context of the launch at AAA 2025 of a new anthology of ethnographic work on fertility and reproduction edited by Sarah Franklin and Marcia C. Inhorn that builds on the pathbreaking work of Ginsburg and Rapp. *The New Reproductive Order: Technology, Fertility and Social Change around the Globe* argues that despite its new centrality to both politics and scholarship, reproduction and fertility remain haunted by past absences as well as the spectral presence of longstanding stereotypes and misconceptions. In the second part of our roundtable we will extend our focus on what has changed and what has stayed the same from the point of view

of feminist reproductive studies over the past three decades. What can we learn from the narratives, images and tropes – as well as products, practices and politics – through which reproduction and fertility are organized today about their ongoing significance to social and political life? Using specific examples from detailed case studies around the world, we reflect further on these and related questions at a key turning point in global reproductive politics today. The two co-editors as well as four contributors to *The New Reproductive Order* will be joined by Aditya Bharadwaj as our discussant to offer an historic occasion to look back over three decades of feminist reproductive studies at a crucial pivot point for global reproductive politics.

[Note to General Call Reviewers: This is the proposed second part of an Executive Session by the same title, and both roundtables are linked to a launch by NYU of the anthology at AAA 2025.]

2723 The Living Dead, the Living Landscape, and Other Nonhuman Agents in the Maya World (Part III)

Start Date: 11/21/2025 4:15 PM **through** 11/21/2025 5:45 PM

Venue: Sheraton **Room:** Grand Ballroom E (5th fl)

Type: Oral Presentation Session

What a western framework often labels as ghosts, apparitions, spirits, and specters inhabit the world with us, but they are called different names by different cultural groups. As such, how these groups relate to them also varies from western imaginings. In the Maya world, which spans across the countries of Mexico, Guatemala, Belize, and parts of Honduras and El Salvador, these entities still permeate through an imposed reality that stems from the colonial era. Starting in the 16th century, Indigenous groups of Maya descent were subjected to destabilizing colonizing forces in order to assimilate them to a Christianized way of viewing the world. Often, colonizers labeled these nonhuman agents as demons that needed to be purged from Indigenous minds, bodies, and souls. In Maní, Yucatán, Mexico on July 12, 1562, Friar Diego de Landa commissioned an auto da fe, in which "thousands of sculpted deity images and associated ritual paraphernalia," such as hieroglyphic codices, were burned (Christensen 2016, 22).

Yet, neither fire nor time could destroy these nonhuman agents, as they still inhabit the world—for instance, as features in the landscape. In this interdisciplinary session—split into three parts—we examine the myriad of nonhuman agents who populate the Maya world and regularly engage with human communities, as ancestors, deities, earth spirits, guardian angels, and other powerful beings. Using perspectives rooted in all four anthropological subfields and related disciplines, participants will examine how the Maya conceive(d) of, engage(d) with, and depend(ed) upon these beings in the past and present. Part 1 will focus on the living dead. Particularly, how the Maya interacted with their real and imagined ancestors, from regular ritual offerings to incorporating the dead into the foundations of houses and other structures. Part 2 will focus on the living landscape,

from guardian spirits of specific domains to how statues were treated as living humans. Part 3 will focus on a wide range of other beings who populate the Maya landscape, from living mountains to the spirits of unborn children.

Presentation(s): Queenly Power of the Ancestral Maya: An Examination of Birth Magic, Sorcery, and Divination as Political Tools

In recent years, I have focused on the symbolic significance of Classic Maya royal queens of the snake realm (Kaan) and their Late Classic (~AD 550-900) political prominence. I have argued their queenly power was grounded largely from their status as royal women with reproductive power being central to their political cachet. In this talk I explore ethnographic and archaeological data - including material from the ancestral city of Waka' - that concern the potent magic of the womb, fertility, sex, and birth as fundamental to Kaan queens. Specifically, I examine how their capacity for birthing and birth work further legitimized their roles as conjurers and diviners, as sorcery is metaphorically linked to birthing. Following Mesoamerican creation ontologies of gender complementarity, I explore how wielding the sacred power of birthing as conjuring elevated the political legitimacy of royal Maya women of Kaan and beyond for generations.

Presenter(s): Olivia Navarro-Farr

Earth Spirits, Ancestors, and the “Hidden” Economic Costs of Production and Exchange in the Maya World

Contemporary models of ancient Maya production and exchange are rooted in post-Enlightenment perspectives that focus on quantifiable, observable data—raw materials, energetics, etc. Archaeologists often employ least cost pathways and other analyses that prioritize energy conservation above all, with some attention paid to additional obligations to lords and patrons in the form of taxes or tribute. Ritual activities continue to be considered separately in spite of some convincing work by James Brady (2005) and others that caches, tombs, and other ritual deposits formed a major part of ancient consumption practices by removing status goods from circulation. In this paper, the authors examine ethnographic, ethnohistoric, and iconographic sources to argue that ritual activity is an essential and significant part of production and exchange as well. Earth lords, ancestors, and other nonhuman persons were powerful landowners on the ancient landscape who required payment for anyone passing through, building on, taking from, or otherwise working on their land. Classifying the completion of these obligations as "ritual" that is

considered separate from economics is the result of our own biases being imposed onto another ontological system which leads to models of production and exchange that do not accurately reflect Maya thought and practice.

Fetal Malevolence in Lacandon Maya Folk Beliefs

Unlike American society where pregnancy and birth are usually a cause for celebration, Lacandon Maya couples expecting a baby are reticent to discuss their pregnancy experiences and do not announce the birth of babies. Newborns are called "possum" and not named for several months. The most common explanation given for this behavior is that with high rates of infant mortality, this is a strategy to lessen the emotional pain of losing infants by minimizing their social existence until parents are sure the infant is likely to survive. More recent information however, indicates that Lacandon parents perceive a fetus as a powerful and potentially malevolent spiritual being who is capable of harming people and breaking objects. To protect themselves, pregnant women wear curing strings (hach k'uch) as a charm to protect themselves. They also give curing strings to people in their households to protect them from harm and to prevent the fetus from spoiling or breaking things that are being manufactured in the house such as wooden implements or clay containers. Care is also taken not to acknowledge the fetus and draw its attention.

Presenter(s): Reece McGee

Royal Jewels and Conjuring Tools: Royal Authority and the Preternatural at Buenavista del Cayo, Belize

One of the foundations of Classic Maya divine kingship was the privileged role of kings and queens as interlocutors and intermediaries with powerful preternatural forces, such as deities, spirits, and ancestors. Mayanists have elucidated this ideological complex through archaeology, iconography, and epigraphy, and one central element is the practice of conjuring forth powerful beings from other domains of the cosmos to be present in this world. This practice is reflected in the iconography of double-headed serpent bars and vision serpents, glyphs for conjuring, and objects such as mirrors and scrying bowls. In this paper, we discuss nine elite burials, including five royal burials, from Buenavista del Cayo, Belize, to argue that the practice of conjuring was central to claims of legitimate royal authority by the polity's divine kings for at least 250 years, beginning around AD 450. We examine sacra buried with important personages, including a marine shell gorget buried with the dynastic founder; pyrite mirrors and ceramic bowls used for scrying and conjuring; and ceramic vessels with imagery of beings conjured from other realms.

Discussion

8817 From Submission to Publication: Advice for ECRs from AAA Editors.

Start Date: 11/21/2025 4:15 PM **through** 11/21/2025 5:45 PM

Venue: Sheraton **Room:** Grand Couteau (5th fl)

Type: Workshop

Join us for an insightful panel discussion that will guide you through the lifecycle of a journal article—from submission to peer review, revision, and final publication. Our esteemed panel of editors will share their expertise on what makes a strong submission, how to navigate the peer review process, and tips for successful revisions.

This event is perfect for early career researchers, graduate students, and first-time authors who want to gain confidence in the editorial process. The 60-minute panel discussion will be followed by a 15-minute Q&A session, where you can ask your questions and get valuable insights from the editors.

Key topics include:

- What editors look for in a submission
- Common pitfalls and how to avoid them
- Understanding peer review feedback
- Tips for successful revisions

Don't miss this opportunity to learn from the experts and enhance your manuscript submission skills.

7509 Confronting Ghosts in America's Past: Active acts of remembering erased Black cemeteries, communities, and forgotten landscapes hidden in plain sight

Start Date: 11/21/2025 4:15 PM **through** 11/21/2025 5:45 PM

Venue: Sheraton **Room:** Maurepas (3rd fl)

Type: Roundtable/Town Hall

What is it that we must do in these times to remember, to preserve, to build, to listen and learn in the uncanny spaces we navigate daily? This panel discusses memory work or heritage preservation as practice and what it means, looks like, sounds like, and feels like at the level of community to be entrusted with holding space, making spaces to tell stories for the future. We approach this discussion from an intradisciplinary, mixed methods, art and research, local and global perspective. We embrace being in community in New Orleans and see it as the perfect space for bringing our research in conversation.

Panel discussion will range from Black cemetery preservation and memorialization efforts as praxis via the USF Living Heritage Institute; to the work of the African Diaspora Museology Institute in

reclaiming Black memory through museology in the US South; to the power of origin stories in media and political economy in St. Petersburg, Florida; to the archaeology of recovering erased/hidden stories in New Orleans and surrounding communities; to refugee anthropology from Nazi Germany to teaching at a Jim Crow-era HBCU; to the currency of learning from African American elders through stories they share and histories they remember as a means of uplift and power.

2672 Causal Explanation in Cultural Therapeutic and Health Processes: New Directions in Medical and Psychological Anthropology

Start Date: 11/21/2025 4:15 PM **through** 11/21/2025 5:45 PM

Venue: Sheraton **Room:** Napoleon BR A1 & A2 (3rd fl)

Type: Oral Presentation Session

What can we know when we view cultural processes through lenses of causality? In this panel, presenters discuss how to improve causal reasoning in ethnographic and health-related research. Causal inference is central to medical practices that aim to determine the harms and benefits of therapeutic agents and interventions (Glass et al. 2013), and it has gained new momentum lately in the broader social sciences in what has been called a "causal revolution." Nonetheless, ethnographers and anthropologists have been largely left out of these interdisciplinary causality conversations. By contrast, participants in this panel offer grounded advice on the strategic collection and analysis of field data in order to refine causal inferences (Snodgrass et al. 2024). For example, ritualistic behaviors, such as the Buddhist practices considered here, can have health-related benefits (Sosis and Handwerker 2011; Xygalatas 2022) including stress reduction (Snodgrass, Most, and Upadhyay 2017). Similar buffers against stress are also observed in games and play, particularly role-playing games, which also are considered in the current panel. Moreover, in Asia's largest slum, alcohol consumption is used by men to cope with generational trauma and caste-based exclusions. To clarify possible causal pathways to well-being, presenters unpack these processes with attention to the role of key concepts like confounders, mediators, counterfactual reasoning, and temporality, with the aim of moving beyond establishing mere associations between study factors to causal understanding (Pearl and Mackenzie 2018). Panelists discuss how they incorporate causal reasoning using a variety of field-based (qual-quant) methods involving ethnographic interviews, observations, and surveys. The hope is to illustrate how pathways to health and well-being can be solidified when using causal reasoning in anthropological

research. This panel is of interest to anthropologists researching health outcomes, subjective well-being, religion, games and play, and those interested in advancing mixed anthropological research methods and causal reasoning frameworks.

Presentation(s): Causal Explanation in Ethnographic Research: Theoretical and Methodological Foundations

In classic accounts, ethnographers developed causal arguments for how specific sociocultural processes shaped human thought and behavior in particular settings. Nonetheless, many contemporary ethnographers avoid establishing direct causal relationships between key variables in the way quantitative research relying on experimental or longitudinal data might. This contrasts with a vibrant "causal revolution" unfolding in the broader social and behavioral sciences. We argue in the current panel that for ethnographic studies to illuminate causal processes, it is helpful, first, to state the implicit strengths and logic of ethnography and, second, to connect ethnographic practice more fully to well-developed interdisciplinary approaches to causal inference. We highlight, for example, the abductive inferential logic of ethnography and ethnographers' sensitivity to cultural insiders' explanatory models, which shape experience, motivation, and behavior. We also connect the ethnographic logic of abduction to what Judea Pearl has called the ladder of causality, where moving from association to intervention to counterfactual reasoning produces stronger evidence for causal processes. Further, we show how graphical modeling approaches to causal explanation can help ethnographers clarify their thinking. Overall, we offer an alternative vision of ethnography, which contrasts, but nevertheless remains consistent with, currently more dominant interpretive approaches.

Presenter(s): Jeffrey Snodgrass

A Tale of Spirits and Bodies: Temple Involvement, Moral Agency, and Subjective Well-Being among Thai Buddhists in Colorado

This paper discusses the life of Thai Buddhists in Colorado and how temple involvement impacts moral agency and subjective well-being. Based on field research during 2024-25, I focus on how broad temple involvement including donation, praying, conversing with monastics, can impact moral agency—confidence in making good and ethical life decisions—by helping individuals

achieve emotional equanimity, a balanced state indicating culturally recognized well-being. This paper draws from an ongoing project on ritual and health of Buddhist populations in Colorado. Rather than discussing the moral learning of ordained monastics, this paper turns attention to the embodied, daily practice of lay individuals and their community engagement and discusses such participation with references to Buddhism's historical and spiritual roots. Specifically, I examine how felt moral agency might mediate between broader temple involvement and emotional equanimity. Data collection utilizes mixed qualitative and quantitative ethnographic research methods, relying on techniques and perspectives from medical and psychological anthropology. This paper specifically analyzes mechanisms producing health outcomes within a causal framework. This includes attention to the significance of mediation analysis, particularly counterfactuals and potential outcomes considered at an individual level.

Presenter(s): Xinyi (Katya) Zhao

Role-Playing Games, Self-Concept, and Well-Being: Strengthening Causal Explanations with Novel Ethnographic Approaches

We examine how tabletop roleplaying games (TTRPGs) affect well-being through enhanced self-concept and stress resilience. Here, we focus on three methodological and analytical strategies we used to strengthen our causal inferences. First, we documented in observations and interviews personal explanatory models that players themselves used to explain how gaming shaped their health and well-being. There, we combined thematic analysis with graphical modeling approaches to clarify how respondents understood how third factors—e.g., confounders, mediators, and colliders—might change how gaming impacted their health. Second, we combined reflexive thematic and qualitative comparative analyses of interview transcripts to construct "truth tables" that clarified how confounding factors might produce spurious associations that masked true causal pathways between gaming and well-being. Finally, third, we developed a novel pile sort method where we asked respondents themselves to graphically map causal connections between salient cultural factors (developed from free listing) about what constitutes good and bad gaming sessions. Findings reveal that TTRPGs can positively shape health and well-being, partially through strengthened self-concept via connections with fictional characters and other players. Our methodological approach provides us with greater confidence that these processes are causal ones, which allows us to make stronger recommendations to clinicians and policy makers.

Drinking to Endure: Alcohol, Caste, and Structural Determinants of Health in Dharavi

Manual scavenging—still performed overwhelmingly by Dalits in India—remains a site of intergenerational caste-based exclusion, occupational immobility, and embodied suffering. Drawing on ethnographic fieldwork conducted in Dharavi, Mumbai, this paper explores how men engaged in manual scavenging articulate the psychological and physical consequences of their labor, and how alcohol-use functions as a stigmatized yet socially intelligible coping mechanism.

Based on qualitative interviews and standardized assessments—including measures of alcohol use, depression, stress, and loneliness—the study investigates how alcohol consumption is an attempt to manage emotional strain, exhaustion, and social isolation. Interviews reveal narratives of emotional distress, fatigue, social shame, and a pervasive sense of being "stuck"—in labor, in caste, in body. While often perceived as damaging, alcohol use is framed as a necessary form of self-regulation in the absence of institutional care. This paper engages causal reasoning to explore how labor precarity, stigma, and psychological distress intersect to shape health outcomes. In doing so, the paper challenges normative assumptions about resilience and healing by foregrounding how individuals navigate suffering in the context of systemic abandonment.

Presenter(s): Choeeta Chakrabarti

Livin' on the Edge (of Consonance): Causal Pathways of Culture and Health in Brazil

This paper examines the causal mechanisms linking cultural consonance—the degree to which individuals approximate the shared expectations of their cultural group—with health outcomes. Cultural consonance has become one of the most replicated and robust theories in anthropology, with consistent evidence across cultures and domains showing that individuals who align their beliefs and behaviors with salient cultural models experience lower psychosocial stress and better health outcomes. However, the causal pathways underlying this relationship remain underexplored. Drawing on data from an ongoing project in Brazil, we employ a mixed-methods approach to test a theoretical framework in which two key mechanisms mediate this relationship: internalized motivations to maintain a coherent sense of self, and external social pressures to conform. The actualization of internalized beliefs helps individuals avoid cognitive dissonance, while concerns of social sanctions and status-based consequences reinforce group adherence. We present preliminary evidence supporting this causal model and discuss implications for understanding the role of culture in shaping health.

Presenter(s): H.J. Francois Dengah

Co-author(s): William Dressler

Rhizomatic Reasoning: Cultural Consonance, Multiplicities, and Disordered Eating in Korean Masculinities

Recent advances in cultural consonance theory—that the extent to which individuals can approximate a locally valued cultural model in their own lives is associated with better health outcomes—indicate that relevant cultural models through which individuals pursue cultural consonance vary based on structural conditions and the intersubjective norms of the specific time-space in which such actions take place. From this has emerged a new interest in causal reasoning: here, the processes by which individuals engage the right cultural model from the total "pool of information" available to them in response to a given challenge. Following Deleuze & Guattari (1987), I argue that this process less takes the form of "arborescent schemas" (i.e., decision trees) than of "rhizomatic assemblages": the constant initiating and severing of associations between cultural models, following emergent paths of meaning in attempts to align with the dynamic

demands of the interactive time-spaces in which such attempts are performed. As a result, cultural consonance may not always be healthful, or may not have any effect on health at all. In South Korea, the cultural process of becoming a man involves historically constructed expectations constantly challenged by rapidly changing social, increasingly precarious economic, conditions. Young men engage models of male body ideals as one of multiple modes of becoming a man, which leads to disordered eating among many of those who take this pathway.

Presenter(s): Lawrence Monocello

8249 New Ethnographic Approaches in Early Childhood Educational Policy Research.

Start Date: 11/21/2025 4:15 PM **through** 11/21/2025 5:45 PM

Venue: Sheraton **Room:** Napoleon BR A3 (3rd fl)

Type: Oral Presentation Session

This session examines how two complementary ethnographic methods -Comparative Case Study (CCS) and Video-Cued Multivocal (VCM) ethnography -can be applied to conduct systematic cross-cultural policy analysis in early childhood education. Our diverse panel of researchers presents findings from Tanzania, Samoa (a US-occupied Pacific nation), China, as well as ECE programs in US immigrant communities and rural Appalachia, demonstrating the benefits of combining these approaches to yield contextually relevant insights into policy negotiation.

Early childhood education globally has experienced increased regulation and standardization (Swadener, 2023). Organizations like UNESCO and UNICEF have established universal notions of "quality" (Mahon, 2016). While these standards provide guidelines for curriculum, teacher qualifications, and classroom environments, they often overlook culturally specific interpretations of quality and learning (Author, 2019; 2020; 2024).

Our methodological innovation combines CCS design-a multi-site approach comparing policymaking across different settings (Vavrus & Bartlett, 2009)-with VCM ethnography-which uses recorded situational cues to facilitate discussions among diverse stakeholders (Tobin et al, 1989; Hseuh & Tobin, 2011). CCS examines flows of activities, concepts, and conversations across spaces from classrooms to government ministries, analyzing policies along both horizontal and vertical axes. VCM complements this by uncovering implicit cultural norms that shape policy interpretation.

A key challenge in policy analysis is balancing broad patterns across diverse contexts with site-specific characteristics of policy negotiations (Ball, 2022; Author, 2024). Our comparative studies provide detailed descriptions that challenge assumptions, identify solutions, and illustrate limitations of national approaches to early childhood education (Tobin et al., 2009).

Policy implementation is dynamic, continuously shifting as it encounters different cultural contexts. A singular methodological approach is limiting in accounting for relationships between macro and micro levels in policymaking. Our two-pronged approach captures these complexities,

illuminating how beliefs, ideologies, regional circumstances, and political dynamics influence policy realization. We envision this as a complex and multifaceted conversation in which each paper explores a distinct facet of this unique methodological approach.

Section: Council on Anthropology and Education

Organizer: Allison Henward

Chair: Bethany Wilinski, Michigan State University

Presenter(s): Allison Henward, Kiyomi Umezawa, Yue Qi, Pennsylvania State University, Sungryung Lyu, American University

Presentation(s): History and Framing the method

Our session begins by examining critical incidents during fieldwork that led to the development and strengths of our methodological approach. We combine field notes and transcripts from studies conducted in Tanzania and Samoa to discuss how local incidents inspired us to merge video-cued multivocal ethnographic interviews with comparative case study research designs to create a dual, comparative, and multi-site model explicitly designed for ethnographic policy research. In line with Hornberger and Johnson's (2006) approach of "slicing the onion ethnographically," our approach entailed having participants compare implicit policymaking approaches across various geographical, social, and temporal contexts. By emphasizing the benefits of combining vertical and horizontal axes in our model, we will show how it enables participants to fully convey the importance of context and cultural sustainability in configuring policymaking.

Transversal video-cued approaches in New Immigrant Settlements

In this paper, I present an anthropological comparative study examining Head Start's language policy. Specifically, I conducted a multisite ethnographic study to explore how Head Start educators serving multilingual children in new immigrant settlements (NIS) in Pennsylvania understand and implement the language policy. Enacted in 2007 as part of the Integrated Head Start and School Readiness Act, this policy mandates Head Start educators to incorporate children's home languages into their classroom practices.

My focus is on new immigrant settlement areas in Pennsylvania that have witnessed significant growth in immigrants, primarily from the Dominican Republic and Puerto Rico. The central question guiding my study is how educators navigate and negotiate the pressures of policy and school readiness, which may contradict each other, while striving to reflect their language beliefs and ideologies in their everyday practices.

To address this question, I employed a modified version of Video-Cued Multivocal Ethnography (VCM) and Comparative Case Study (CCS) methodologies for data collection and analysis. These methods aim to assist me to have a comprehensive understanding of the broader context and to seek a more equitable approach to serving multilingual children in this dynamic environment.

Presenter(s): Kiyomi Umezawa

Transnational Comparisons using VCM

In this paper, I draw on my doctoral research, a multisite ethnographic study on early childhood teachers' experiences during and after the global pandemic. I delve into how teachers interpret and perform their professional roles in diverse contexts within the U.S. and China. My research centers on how globally circulated and teachers in each country shape national perspectives of professionalism. Considering policy from the Ministry of Education in China and federal Head Start policy, I explore the interplay of gendered, racialized, and ethnicized identities in teachers' understandings and practices. Moreover, I examine how individual agency and resistance to imposed discourses contribute to transforming policy through everyday practices.

To capture a diverse range of voices from early childhood educators in the United States and China, the study modifies Video-cued Multivocal Ethnography, also known as the Preschool in Three Cultures (PSin3C) approach developed by Joseph Tobin and colleagues. This study entails filming in a Head Start preschool class in central Pennsylvania and a kindergarten class in Jiangsu province, complemented by fieldwork and individual and focus group interviews conducted across two countries for this two-year study. In my analysis, I attend to a vertical and horizontal axis of policymaking.

Presenter(s): Yue Qi

Negotiating multiculturalism in Appalachia through CCS and VCM

This ethnographic investigation examines the negotiation of culturally responsive teaching by white Head Start educators in a predominantly white, working-class rural Appalachian community. Employing a vertical case study methodology alongside Video-Cued Multivocal ethnography, the research reveals complex interactions between local cultural practices and federal and state early childhood education policies that mandate diversity, inclusion, equity, and belonging. The study illuminates how community-specific pedagogical approaches and values mediate policy implementation, often reducing the intended impact of multicultural initiatives. Through this methodological combination, the research demonstrates the nuanced ways in which whiteness functions within regional socioeconomic contexts, showing how it is negotiated, reconstructed, and reaffirmed through the interplay of race-class hierarchies and local economic factors. These findings contribute to our understanding of how cultural identity and regional specificity influence the implementation of national educational policies in rural communities.

6342 Compelling Forms, or, “What kind of instrument am ‘I’?”

Start Date: 11/21/2025 4:15 PM **through** 11/21/2025 5:45 PM

Venue: Sheraton **Room:** Napoleon BR B1 (3rd fl)

Type: Oral Presentation Session

What makes a form compel? What is it to be compelled by form? And what does it mean for anthropological research and writing that some forms compel and address us (or one another) more than others?

These questions originate in the recognition that anthropological encounters with words, images, and sounds, along with formal qualities of worldly things like clouds, fire, wind, water, inter alia, involve elements of fascination, recognition, resonance, even perhaps obsession. Emphasizing the capacity of such forms to undo or critically refashion given understandings or predilections, we privilege forms that are less legible or accountable within existing epistemological frames. These include minor gestures, the almost imperceptible or seemingly inexplicable, the supernatural or surreal, edges and margins, that which remains unclassifiable, forces that give weight or weightlessness, and traces and hauntings of immaterial things.

The panel is inspired by the captivating resonance experienced upon encountering a passage in a text, and the lure or capture of something that might become a subject of inquiry. Drawing our title from William Mazzarella's essay "What Kind of Instrument Am I?" we underscore the capacity of forms to fascinate, thereby interpellating or impelling us in sometimes unexpected ways.

Forms that fascinate raise questions for the epistemological project of anthropology, and for certain underlying assumptions of the discipline. The allure of such forms challenges the possibility of critical distance, foregrounds the variety of attachments that may drive anthropological inquiry, and suggests the impossibility of any position "outside" or beyond such attachments. Rather than restabilizing an extant anthropological project through the refinement of its conceptual tools, however, we focus on the unwieldy or unanticipated possibilities that might emerge in such encounters. These include the destabilization that can accompany the force of compelling forms, for our writing, our research methods, and for how anthropology conceives of its research objects, interlocutors, and itself.

The notion of the figural offers one approach for exploring implications of such encounters with form. Similar to survivals, glitches, and some understandings of the ghostly, the figural is conceptualized as an opening onto a possibility or otherwise, with an emphasis on the ways it "strikes, resists and reverberates," giving "shape to perception" (Largier 8, 9). To suggest that perception emerges in encounters with compelling form is also to put pressure on the stability of the subject, or an anthropological "I." A figure or compelling form may, in this way, displace or otherwise make the perceiving subject recede. In this way, "I" itself might be a compelling form haunting the discipline.

These are ghosts of anthropology. What, though, if anthropology itself is a haunting, the ghost with which we should contend?

Discussant: Marina Peterson, University of Texas at Austin, William Mazzarella, University of Chicago, Department of Anthropology

Presentation(s): Winter Pastimes: Otherworld Visitors, Migrations, and Lateral Comparisons

Across the northern hemisphere, midwinter has seen the appearance of masked figures, often bedecked with horns, fur, foliage, or other trappings, and widely identified as visitors from another world. Even observers keenly attentive to local differences have found it hard to resist comparing these and other seasonal visitors across time and space. French photographer Charles Fréger, has recorded such costumed apparitions across Europe and subsequently in Japan, the Caribbean, and, more recently, India. British writer Zoe Gilbert, in her novel *Mischief Acts* (2022) recounts successive spatiotemporal metamorphoses of the horned, folkloric figure of Herne the Hunter against a backdrop of accelerating environmental change. Could it be that the impetus to draw such comparisons derives from the figures themselves? Do they actively compel the making of lateral connections, on the basis both of their otherworldly associations and their patchwork construction, pieced together from fragments of the surrounding landscape? Is the comparative urge that they seem to inspire a matter of carrying forward this practice of patching together? Is this informed less by archetypal synonymity than by a sense of otherworldly difference, infusing the here and now with never fully graspable intimations of other times and places that invite not an analytic response but a receptivity to visitation? How might such receptivity speak to a time of border walls and fences, when not all visitors are welcome?

Presenter(s): Stuart McLean

Forms of Encounter in the Lawns and Skies of Abandonment

This presentation is a video and word collage exploring formless feelings spurred by ecological and social uncertainty. These feelings raise questions. How do we approach increasingly haunted encounters between human and non-human beings? How do we ethnographically engage with an emergent object still in the process of realizing its form? On the verge of explicitly naming traces of centuries of destruction, people experience charged moments of continuity and shift. The presentation suggests incomplete forms of social, industrial and scientific imaginaries accumulating into earthly attachments, shot through with a background sense of the seeming inevitable colonization of other planets. Focusing on dimensions of human engagement with the nonhuman earthly world, the overall scenario presents encounters with nonhuman animals who wander a neighborhood after a woods has been razed and developed, and explores how sensed spirits of trees, grasses, waters, and crops merge into both ghostly and material presences. Earthly solidarity and estrangement manifest in the mundane weirdness of a range of encounters, from an angry raccoon to a fleeting ghost in the author's yard. This collage is a performance meant to invite discussion about a collective felt experience, in its nostalgia, anxiety, outrage, love, and will to act.

Presenter(s): Susan Lepselter

Fire's Image

Drawing on research in northern Australia and southern California, this presentation re-introduces fire's contemporary capacities to fascinate, illuminating the ways these might both compel anthropologists and challenge anthropology. It does so by exploring how fire challenged this research, deranging the sense that one form of interlocutor and set of questions made, while introducing others. At its center are four figures, one the material manifestation of a burnt tree – a cinder; the second a cloud of bushfire ash and smoke, lumbering across the sky; the third a photojournalist's rendering of urban wildfire as it meets a stretch of glass windows; and the fourth, a glass of milk, rendered in an artist's book of images. These entities, a piece of ash, a cloud of smoke, and two photographs, evoke the work of compelling form in interrupting and refashioning sense. As interruptions equally in a broader image ecology, they also participate in remaking fire's image, survivals of a kind that qualify fire's apprehension in a moment of global burning. Taken together, they suggest the ways fire might be understood to author its own conditions of possibility, while affording other questions: What can such images apprehend of the anthropological 'I' captured or otherwise displaced by encounters with fire's compelling forms? And how might they make this 'I' more apparent as itself a compelling form?

Presenter(s): Daniel Fisher

4340 Future Pasts in Digitalization and Datafication Processes

Start Date: 11/21/2025 4:15 PM **through** 11/21/2025 5:45 PM

Venue: Sheraton **Room:** Napoleon BR B2 (3rd fl)

Type: Oral Presentation Session

In an Annual Review article about the politics and poetics of infrastructure, Brian Larkin (2013:335) wrote that "infrastructures operate on multiple levels concurrently," alluding to the idea that infrastructures possess multiple temporalities. In a nutshell, the ghosts of previous infrastructures inhabit and become part of new ones. This affirmation by Larkin drives our panel on digitalization and datafication, as digital technologies bring forth situated images of what the future should look like (Dourish and Bell 2011). Future-oriented promises continue to reorient the resources of the present (Elish & boyd 2018), but a more systematic focus on these sociotechnical practices must be attentive to the multiplicity of temporalities in contemporary technoscientific and capitalist developments (Bear 2014; Burrell 2020; Johnson 2019). In line with Robinow (2008), we need to look at "contemporary" digitalization and datafication "in the present where recent pasts, near future, and emergent forms can be observed."

The papers integrating this panel bridge theoretical and conceptual frameworks from Anthropology and Science, and Technology Studies (STS), featuring contributions from the US and abroad that explore the spectral presence of "ghosts" within various digital systems. These six papers address questions pertinent to data-driven digital technologies in different realms, such as: environmental/agricultural, linguistic, medical, and corporate and legal landscapes in different geographies

While described as future-oriented technologies, our panel, in a nutshell, investigates how the past haunts the present and future through the incorporation of older farmer relationships and knowledge in the formation of "futuristic" digital farming technologies; the creation of digital heritage systems for archiving and accessing human remains through socio technical contexts; competing ideologies and histories of language that haunt AI; the classification of data for AI training; the relationship between the historical timber sector and its digitally mediated, automated management; and the intersection of state sovereignty and emerging surveillance technologies. While addressing the anxieties surrounding the potential for digital technologies to perpetuate or even amplify existing social inequalities (Noble 2018, Benjamin 2019), we hold space for emergent collaborations between data, infrastructures, and humans and non-human relationships in these different temporalities that constitute datafication processes.

Our panel explores the spectral presence of digital "ghosts" within various digital systems, and promotes discussions related to the potential of digital technologies to replicate and amplify pre-existing harms, and to contribute to the creation of more equitable and sustainable futures.

Presentation(s): Embedded Ideologies: Arabic LLMs, Data Work, and the Tashkeela Language Corpus

As large language models (LLMs) have risen in prominence, technology companies across the Arabic-speaking world have turned their attention to collecting, curating, and categorizing text and speech recordings to produce language corpora for Arabic. While corporations regularly frame LLMs through the lens of technological rupture, ushering in the democratization of intelligence, the labor of generating data to animate LLMs is deeply embedded within long-standing processes and infrastructures, whether Arabic's incompatibility with early Internet infrastructures or colonial-era language ideologies about its "primordial" nature.

This paper asks how technological imaginaries of LLMs obscure the ideological, material, and linguistic pasts that shape Arabic-language technologies and technical labor in the present. It does so by drawing on ethnographic fieldwork in Amman, Jordan, alongside analysis of technical publications and online forums, to craft a biography of a popular dataset for vowelizing Arabic: the Tashkeela Corpus. The story of Tashkeela, built on text scraped from an Islamic digital library software, reveals the circuitous pathways, controversies, and mediations through which language corpora are brought into being to animate LLMs. Focusing on this dataset and its afterlives, this

paper argues that competing ideologies and histories of language come to haunt the AI technologies that are built with it.

Presenter(s): Tariq Adely

Digital Timber? Resource Pasts and Logistical Futures in the Pacific Northwest

In the past two decades, timber has been rediscovered as a cutting-edge construction material: carbon-sequestering, but also digitally machinable and thus suited to the current wave of automation in construction. Analyzing the cultural politics of mass timber construction in the contemporary Pacific Northwest, I show how its advocates build collective narratives about timber as both old and new, in the process positioning informatic approaches to the built environment and data-enabled logistical optimization as environmentally necessary and even natural. Drawing on fieldwork across the supply chain for digitally-fabricated timber in Oregon and Washington, I argue that this interplay between techno-logics and painful environmental histories constitutes a kind of remediation, in which the lasting infrastructures, cultures, and crises of a resource economy become raw material for digital techniques and promises. Remediation has reverberating meanings in media theory, industrial ecology, and environmental justice movements—referring on the one hand, to the work of repairing landscapes disrupted and abandoned by industry, and on the other, to the incorporation of old modes of mediation into new operative, material, and cultural formations. Thinking these meanings together offers anthropologists of the digital a new analytic for theorizing the overlaps and divergences between recapitulation, repair, and reform.

Presenter(s): Megan Wiessner

Digitalization with the past: (In)justices in digital farming in Turkey

During my ethnographic research on the digitalization of agriculture with farmers, public officials, and technology company representatives in Turkey, I observed that data-driven digital farming technologies are promoted as solutions to address the environmental and socioeconomic challenges of farmers. They include autonomous technologies (e.g., drones for spraying and autosteering tractors) and decision-support tools (e.g., smartphone applications featuring satellite images of farms, automated irrigation, and spraying programs). While often hailed as the "future of agriculture," these technologies are also haunted—and shaped—by the past. Specifically, farmers' older farming practices and socialities are recalled by digital farming technology companies to upgrade their technologies; to maintain their relationships with farmers to collect data; and to overcome the incompatibility between existing infrastructure and new digital technologies. While existing literature highlights how future-oriented anticipations regarding digitalization contribute to power inequalities (Elish & boyd, 2018), this paper explores how the past is integrated into the process and potentially reinforces these inequalities. I will also question whether it is possible to render the past "contemporary" (Rabinow 2008) and allow farmers to publicly express their past, present, and future challenges. In other words, can the ghost of the past be haunted for justice?

Presenter(s): Ziya Kaya

Data Politics and Data Centers: New Factories in Late Capitalism

Anthropologists have long observed how cultural patterns shape what counts as data and how data are used. My presentation provides an overview of the literature on the classification of data for AI training. How does the "artificial" in artificial intelligence relate to nature/culture debates in feminist theory? How does it open up new pathways of thought and action? Drawing upon texts from history of science and statistics, critical data studies, and science ethnography, my presentation will shed light on how machine learning connects to capitalism, eugenics, race/racism, and how it influences the ongoing formation of the surveillance state – or "how the past haunts the present and future" by considering how AI reinforces different systems of oppression. Tying this discussion to my fieldwork in the city of The Dalles, Oregon, where Google has owned and operated a data center since 2006, I present data and data centers as part of an ecosystem of extractive industries. Data centers, as anthropologist Steven Monserrate (2023) describes them, are an iteration of capital's new "factories," where data is the new commodity. In sum, my paper addresses the way capitalism actualizes itself via digital data.

Presenter(s): Ana Carolina de Assis Nunes

The Coded Gaze: Grappling with Kenya's Adoption of Chinese Surveillance Tools

The research conducted to date on digital surveillance in Africa focuses largely on the wide distribution of Chinese technology, drawing attention to the fact that regime type is a poor predictor of the purchase and use of that technology. Much less attention has been given to questions about how they actually work, why they are in great local demand, and how they change, or do not change, state capacities. The existing literature overlooks a crucial paradox: while enhanced digital surveillance is desired as a means to buttress African government power—due to its policing and managerial capacities—it may also actually undermine state sovereignty. Note, in the latter regard, that digital surveillance tools are embedded within processes that result in the privatization of the state; the outsourcing of state functions to Chinese tech giants, like Huawei, has transformed government, in part, into a holding company in the business of franchising out many operations, including police services, and hence much of its sovereignty. Ironically, these digital surveillances aimed at improving governance are inspiring distrust among citizens, which also challenges sovereignty. This is all done within the context of a supposedly weak African state that seeks to ameliorate its incapacities from the colonial encounter. The changing nature of the connection between digital surveillance infrastructure and state sovereignty—and the paradox at its core—is, thus, a key object of study.

Presenter(s): Bulelani Jili

Ghostly matters: Institutional response-ability and the digital life of human remains

This presentation explores the digitization of human remains, which have been discussed in bioarchaeology as "complex categories" of objects – both objects of science and physical manifestations of lived lives (Nilsson Stutz 2023). Drawing on autoethnographic research at a medical museum in Scandinavia, and on interviews with experts working with human remains
